## Preface

All aspects of business and professional ethics originated sometime in the latter twentieth century. The encyclopedia includes the ethics of the production and definitional inquiry into these subjects. Other sections focus on emergent areas of human rights concerns. These include topics which reference human rights issues including those that impact on the rights of Indigenous peoples, women, and children, especially but not exclusively to these populations in developing nations.

---

## Introduction

It is often difficult in contemporary academic scholarship to reach agreement about when a new discipline became considered as such. With respect to the concepts of business and professional ethics, we are talking about applied professional ethics generally as well as some specific interpretations of ethics with respect to business as a discipline and applied professional ethics, such as, research ethics generally, healthcare, counselling ethics, and social and applied ethics. While respecting this lack of consensus of specifically when these disciplines evolved, we will take the perspective that all aspects originated sometime in the latter twentieth century.

Michalos and Poff (2013) used Kuhn's 1970 *The Structure of Scientific Revolution* in which he identified the emergence of a new paradigm or discipline. As stated in their anthology Kuhn,

...described a number of notable and recognizable features of an area of intellectual inquiry and discovery that are germane here. . . according to Kuhn, [these features include] the enhancement of scholarly careers and reputation through the publication of journal articles and the initiation of those specialized journals where articles are 'addressed only to professional colleagues, [where] the men as knowledge of a shared paradigm can be assumed. . . (Kuhn. P.20). Further, Kuhn noted that the establishment of learned societies, the establishment of curriculum and fields of study as legitimate disciplines within universities. . . are additional indicators of the acceptance and adoption of [the new discipline as is the publication] of monographs on theory and methodology...and the production of textbooks. . . (2013, pp. 1–2)

With respect to research ethics, as Poff (forthcoming) notes:

During the twentieth century, scholar practitioners, and governments developed numerous and extensive principles, guidelines, definitions, theoretical, philosophical and empirical requirements and treatises on the nature of ethical research and what should follow as impositions against violations of intellectual inquiry on unethical grounds.

Perhaps the most notable early example of such principles was the Nuremberg Code (developed in 1947). The Code was developed as part of the Nuremberg trials of war crimes and importantly articulated research ethics as requiring free and informed consent of participants of research (1949, Tribunals under Control Council Law Number 10, volume 2. US Government Printing Office).

With respect to the scope of the current encyclopedia, it has been more liberally defined as not only including business and professional ethics per se but also including the ethics of the production and definitional inquiry into these subjects. Consequently, the encyclopedia includes not only standard material on business and professional ethics that would be included generically in other encyclopedias but also specific investigations of the production of such definitions. These include:

- A section edited by Israel on various aspects of research ethics, such as autonomy and informed consent; conflict of interest in research; covert research; deception and research; etc.
- A section edited by Pierson on the conflict of commitment in counseling ethics and ethical issues in vulnerable populations, such as with participants who are children and adolescents.

We also include a section edited by Pierson on ethics with respect to the production of knowledge, such as:

- Ethical peer review
- Ethical representation of data
- Funding and sponsorship of publications
- Ghost, guest, and gift authorship.

Other sections focus on emergent areas of human rights concerns more frequently identified in encyclopedias of human rights. These include topics which reference human rights issues including those that impact on the rights of women, children, and Aboriginal or Indigenous people. Such topics include:

- Gender and food security
- Large-scale resource extraction and violence against women
- Identity politics and ethics
- Indigenous environmental justice
- Polar tourism
- Corruption and gender
- Indigenous peoples and the ethics of resource extraction
- Gender and macroeconomics
- Gender, economics, and unpaid work
- Business and human rights
- Business ethics and sexual harassment
- Child labor and child slave labor in the world of international business, including resource extraction and mining

Additionally, there are many entries which focus on increased environmental degradation and the seemingly irreversible environmental impact of business development and operations, particularly in third world countries. These include:

- Corporate sustainability and climate change
- Environmental ethics and sustainability
- Directors' duties to tie executive pay to advance environmental protection
- Environmental philosophy and business
- Human rights duties toward future generations and achieving climate justice

As well, significant attention is paid to the impact of computer technology and business ethics. Such topics include:

- Social media screening and privacy issues in recruitment
- Social media speech and the workplace
- Standardization and the governance of artificial intelligence standards
- Technology ethics: origins, paradigms, and implications for business and society
- Whistleblowing and information ethics
- Ethics and artificial intelligence

If we view business ethics as an emergent discipline, the literature in the discipline evolved in a couple of ways. One was conceptual with theoretical discussions of concepts like corporate social responsibility while another involved analysis of empirical data on actual legal and moral violations by businesspeople of people, animals, and the environment. Many encyclopedias and handbooks of business ethics identified and defined both conceptual notions within business ethics as well as illustrated business ethics cases through discussions of famous or infamous legal and/or ethical violations of newly developed theories and concepts of the nature of corporately responsible businesses.

At the same time, literature began to focus on responsible ethics with respect to the treatment of animals and humans in bioethics. As noted above, some of this literature emerged after the Nuremberg Trials which elaborated and exposed horrendous involuntary harm done to human beings as subjects of research. Throughout the latter part of the twentieth century, textbooks, handbooks, and encyclopedias were published exploring the nature and principles of biomedical ethics which serve to entrench the rights of human beings to become active, voluntary participants in health research rather than less than voluntary passive subjects of such research. As well, the nature of the rights of animals was articulated with enforcement from governments to outline appropriate standards of ethical experimentation on animals in research and a balance between acceptable animal harm and the importance of the research.

An interesting facet of the more recent trend in business and applied professional ethics is not only an examination of businesses and biomedical

institutions but self-reflective research on the researchers and publishers of the research.

As Poff (2020a) notes in an article in this encyclopedia,

...with respect to the profession of university faculty, specific attention has been focused on the university faculty members as researchers and as disseminators of scholarly research through publication in formats like journal articles and monographs. The values underlying research and dissemination include both the identification of generic positive normative values like rigorous methodological practices and the identification of forms of particular violations of research integrity and publication ethics.

The values approach not only includes explicitly ethical theories and principles of practice but also nonmoral knowledge-based norms, such as methodological rigor, proper citation practice, and other practices that fall under the rubric of the responsible conduct of research. Governments in particular have focused on risk management, addressing allegations of misconduct, utilizing disciplinary approaches to guarding the public interest and in the prudent and lawful utilization of the public funding of scholarly research and in protecting the integrity of the scholarly record. University risk management has undoubtedly had an impact on university academic administrators, given their roles in managing reputational risk factors, building universities, and managing the incursions of governments and local communities into evaluating the roles and responsibilities of universities.

Consequently, business and professional ethics while still focusing on the nature and empirical implications of business ethics and applied professional ethics now includes a commitment and concern to conduct and disseminate studies with principles of research ethics and publication ethics. This includes the teaching of research ethics to both undergraduate and graduate university students (see Poff forthcoming).

As Poff and Ginley (2019) note,

Individual scientists, social scientists, and humanists bear the primary responsibility for the ethical and responsible conduct of their research and for the ethical preparation and submission of the products of research for consideration for publication.

In universities and research hospitals, in particular, researchers frequently are not only individually accountable for the responsible conduct of research and contractually bound by the terms and conditions of their respective grants, they are also responsible for educating and training the next generation of researchers through teaching, mentorship, and oversight. While there may be a current generation of researchers who have not formally been instructed in research ethics and the responsible conduct of research, in some countries, such as Canada and the United States, this is certainly not the case for upcoming scientists and social scientists. Resources to support training and education in research ethics are increasingly available both from funding agencies and universities, including online tutorials. Many methodology courses for undergraduates and graduate students include modules on research ethics.

## **Publication Ethics**

Publication ethics entail the ethical requirements to publish information and disseminate knowledge with accuracy and rigor. Perhaps this is particularly an acute requirement in business and professional ethics where allegations, both criminal and moral, may be made in terms of the research published. There are many types of violations of publication ethics some of which are also violations of research ethics. The most common forms of this problem include

plagiarism and the falsification and fabrication of data. Because of the critical nature of research and publication ethics to the entire projects of business and professional ethics, significant entries are focused on these matters.

### **Other Key Themes in this Encyclopedia**

As noted earlier, many of the standard definitions and headings that you will find in any encyclopedia are included in this material as well. However, as also noted, particular foci within business and professional ethics have emerged as dominant concerns as these fields have developed. These include topics in the areas of human rights, artificial intelligence, and the environment and sustainability. As these areas are considered vital to the future of a person's rights, knowledge, and livability, these topics are strong themes and subthemes here.

### **A Final Note**

Encyclopedias are of importance primarily to two populations: students and faculty. This encyclopedia has attempted to provide an accessible and timely introduction to the important current and future matters in these fields. We trust that this material will prove helpful to all who utilize it.

## Acknowledgements

We would like to thank the Springer people: Michael Hermann; Floor Oosting; Miriam Poort, and Andrew Spencer. We owe a great deal to the incredible support of Alexandra Bakowski and Saskia Ellis, both of whom were extremely helpful throughout the project.

We would also like to thank the expert contributions of the following section editors: John Bishop; Clive Boddy; Edmund Byrne; Patrick Carrabre; David Coldwell; Angelo Corlett; Wes Cragg\*; Scott Grills; Sally Gunz; Andrew Gustafson; Tessa Hebb; Mark Israel; Joanna Kafarowski; Karianne Kalshoven; Muel Kaptein; Anthony Libertella; Samuel Natale; Fiona MacPhail; Joan Marques; Domenec Mele; Cristina Neesham; Geraldine Pearson; Joshua Perry; Charon Pierson; Greg Shailer; Thomas Li-Ping Tang; Helena Blazun Vosner; Andrew West; Gisele Yasmeen; Qinqin Zheng.

Also warm thanks to all of the many contributors to the encyclopedia.

- We were saddened by the passing of our good friend and colleague, Dr. Wes Cragg.

---

## About the Editors

**Deborah C. Poff, CM, PhD** Deborah Poff is a retired Professor of Philosophy and Senior Academic Administrator. She holds four degrees from three universities in Canada (University of Guelph, Queen's University, Carleton University). Her Ph.D. was in Philosophy of Science and her M.A. was in Philosophy of Mind. Her two undergraduate degrees were a B.A. Honors in Psychology and a B.A. Honors in Philosophy. During Deborah's career, she was variously the Director of a Research Institute; a Dean of Arts and Science; a Vice-President Academic; and Provost and a President and Vice-Chancellor at various Canadian Universities.

During her career, she has also been an active researcher, teacher, and editor and is the founding Editor-in-Chief of the *Journal of Academic Ethics* which she edited for over 20 years. She was the Editor of the *Journal of Business Ethics* for over 30 years. She is currently the Editor of the *Journal of Scholarly Publishing*, published by University of Toronto Press. Throughout her career, she has been the editor of five scholarly journals and a book series and has published numerous other monographs and anthologies. Her research and publication areas are: Applied Ethics, including Business and Professional Ethics; Research Ethics; Publication Ethics; Leadership Ethics; and Feminist Studies. In 1995, she was awarded a lifetime honorary membership by the Canadian Research Institute for the Advancement of Women in the category of "Outstanding Contribution to Feminist Scholarship." Her most recent

publication is an anthology entitled “Corporate Social Responsibility and University Governance.” Her monograph in progress is on the history of discrimination from Aristotle to Now. She is currently completing the *Encyclopedia of Business and Professional Ethics*.

Among her many service accomplishments, she served 9 years on the Committee on Publication Ethics Council and Board of Trustees, including in the role of Chair and is a recognized leader in the field of publication ethics. She also served as the President of the National Council for Human Participant Protection in Canada. She has served as a leader and participant member of many organizations and committees, including the British Columbia Degree Granting Committee for the government of British Columbia. She has also been the lead of many learned societies, including as the President of the Women’s Studies Association of Canada.

In 2016, Deborah Poff was awarded the Order of Canada through the Office of the Governor General of Canada.

**Prof. Emeritus Alex C. Michalos, C.M., Ph.D., D.Litt., F.R.S.C.** Alex Michalos is Emeritus Professor in Political Science from the University of Northern British Columbia, where he taught from 1994 to 2001. He was Professor of Philosophy at the University of Guelph (Ontario) from 1966 to 1994, Visiting Professor of Philosophy at the University of Western Ontario (1974–75), University of Waterloo (1971), and University of Pittsburgh (1969–70), and Assistant Professor at the State University of New York (1964–66) and at State College, St. Cloud (1962–64).

His Ph.D. was earned at the University of Chicago (1965) specializing in Philosophy of Science and B.D. and M.A. from the University of Chicago (1961) specializing in history of religions and logic, respectively. He received his B.A. from Western Reserve University (1957)

with specialization in history, philosophy, and religion.

He has published 32 books and over 125 refereed articles, and founded or co-founded 7 scholarly journals. Among the 7, he was the founder of the *Journal of Business Ethics*, the most frequently cited journal in the world devoted to business ethics, and *Social Indicators Research*, the first scholarly journal (1974) devoted to quality of life research. The other journals include *Teaching Business Ethics* (co-founded with Deborah C. Poff), *Journal of Happiness Studies* (co-founded with Ruut Veenhoven and Ed Diener), *Journal of Academic Ethics* (co-founded with Deborah C. Poff), *Applied Research on Quality of Life* (co-founded with Joe Sirgy and Richard Estes), and *Asian Journal of Business Ethics* (co-founded with Allan K.K. Chan, Simon Shun-Man Ho and Kit Chun Joanna Lam).

He is General Editor and founder of the Social Indicators Research Book Series (86 vols.), and co-Editor and founder with Daniel T.L. Shek, Doh Chul Shin, and Ming-Chang Tsai of Quality of Life in Asia Book Series (11 vols.) and co-editor with Deborah C. Poff of Advances in Business Ethics Research Book Series (8 vols.). He edited the 12-volume *Encyclopedia of Quality of Life and Well-Being Research* (Springer, 2014).

He was Chancellor of the University of Northern British Columbia (2007–10), President of the Canadian Commission for UNESCO's Sectoral Commission on Natural, Social and Human Sciences (2004–2008), President of Academy II (Humanities and Social Sciences) of the Royal Society of Canada (2000–2002), President of the Society for Philosophy and Technology (1983–1985), President of the International Society for Quality of Life Studies (1998–2000), and served as Director of Research for the Canadian Index of Wellbeing (2006–11). He has won several awards of distinction, including:

- Gold Medal for Achievement in Research (2004) from the Social Sciences and Humanities Research Council of Canada (the Council's highest honor)
- Member of the Order of Canada, C.M. (2010)

- Queen Elizabeth II Diamond Jubilee Medal (2012)
- Award for the Betterment of the Human Condition (2003) to Social Indicators Research from the International Society for Quality of Life Studies
- Vincentian Ethics Scholar Award (2002) by the Vincentian Universities of the USA
- Award for Extraordinary Contributions to Quality of Life Research (1996) from the International Society for Quality of Life Studies
- Secretary of State's Prize for Excellence in Interdisciplinary Research in Canadian Studies (1984) for his 5-volume treatise *North American Social Report: A Comparative Study of the Quality of Life in Canada and the USA* from 1964 to 1974,
- British Columbia Political Science Association Lifetime Achievement Award (2005)
- Honorary Doctor of Letters from Thompson Rivers University, B.C. (2005)
- Deryck Thompson Award for Community Social Planning (2006) from the Social Planning and Research Council of B.C.

# A

## Aboriginal Ethics: Traditional and Contemporary

Antonia Mills and Rheanna Robinson  
University of Northern British Columbia,  
Prince George, BC, Canada

### Synonyms

First nations ethics; Indigenous ethics; Native American ethics

### Introduction

Aboriginal Ethics were traditionally based on understandings of how relationships with the people within and between different groups and nations and with all the life forms can be created and maintained, with the focus on preserving positive relationships of respect for all life forms. The tradition of respect for one's own and neighboring Nations was and is part of Aboriginal Ethics for Indigenous peoples on all the continents on earth, including Africa, the Middle East, Europe, Asia, Oceania, Australia, New Zealand, North America, and South America. While the Aboriginal peoples in all these different areas throughout the world have their own concepts and practices of Aboriginal Ethics, they were all based on their kin-based societies and the concept that one needs to maintain positive relationships with all their neighbors

and all life forms. While we refer to Aboriginal ethical practices around the globe, this entry focuses particularly on Canadian and North American Aboriginal Ethics.

### Aboriginal Ethics Are Kin-Based Ethics

Aboriginal or Indigenous peoples on all continents created kin relationships not only in their home territory but with the peoples on all their borders and with all life forms. Aboriginal peoples developed ethical relationships with the peoples on all their borders by intermarrying with these different groups, even when they spoke unrelated languages and had different kin systems; for creating and maintaining kin relations helps create amicable, peaceful, and ethical connection with one's neighbors. Some Indigenous societies had and have lineages and clans, either Matrilineal like the Navajo and many Pueblo peoples and the Mohawk or Haudenosaunee and many North American Northwest Coast peoples; or Patrilineal like the Plains Cree, or bilateral like the Kwakwakawak. Some Indigenous peoples have bilateral groups that differentiate between cross and parallel relatives like mother's brother's and mother's sister's children: you can marry your cross cousins or mother's brother's children but not your parallel cousins or mother's sister's children since they were like your own brothers and sisters.

Indigenous kin relations were not only with humans. Turner and Mathews ([in press](#)) point out that Indigenous peoples throughout the world respect the deep kinship they have with all elements of life which include the air, earth, water, plants, fish, shell fish, and animal species which they note also come from spirit and need to be treated with “responsibility, respect, caring, gratitude, love, and generosity” (p. 6). Berkes ([2013](#)) defines everyone’s Ethics as, “Codes that exert a palpable influence on human behavior. Embedded in worldviews, ethics provide models to emulate, goals to strive for, and norms by which to evaluate actual behavior” (p. 380).

Aboriginal Ethics were sustained through an understanding of respectful relationship building with all animate and inanimate life forms. Aboriginal people took the lives of all animals, and fish with respect so they would want to come back and feed the people again (Berkes [2012](#)). For example, among the Cree, Aboriginal Ethics were sustained through an understanding of respectful and reciprocal relationships with many life forms. These ethics were practiced whether the Aboriginal peoples practiced agriculture and had large settlements or where hunter-gatherers who travelled seasonally in their particular territories. These kin-based relationships were extended to the colonizers when they arrived on the shores and land of Indigenous peoples throughout the world. Few people are aware of the influence of Aboriginal Ethics on colonizing society.

Indeed, Aboriginal Ethics led to the creation of western democracy. Most people are unaware that Franklin, Jefferson, and Adams implemented American Democracy from the example of the Haudenosaunee or League of the Iroquois form of government (Morocco [1990](#); Stubben [2000](#)). The elder women in each of the Haudenosaunee clans selected the men who would represent their clan in the Council of Chiefs and replaced them if they acted inappropriately (Wagner [1996, 2001](#)). That this mechanism of creating responsible government is the origin of democratic rights worldwide is generally forgotten in contemporary society.

Aboriginal Ethics were also the source of Women Suffrage and Rights. This is also typically

unrecognized. In fact, Women’s rights to vote in the USA, Canada, and around the world also came from the influence of Indigenous Haudenosaunee or Iroquois Women, who explained to settler women that their men never maltreated or raped their wives or any woman as this was not a part of their way of life (Wagner [1996, 2001](#)). Again, the impact of Aboriginal Ethics on women’s rights is typically unrecognized today.

Aboriginal women’s rights are also manifest in their traditional use of plant medicines to prevent pregnancy if they had had enough children. This is reported for the Beaver Indians (Mills [1985](#)); the Thompson Indians (Turner et al. [1990](#)); the Iroquois (Rousseau [1945](#)); the Mima (Chandler et al. [1979](#)); the Cherokee (Taylor [1940](#)); the Cree (Leighton [1985](#)); the Navajo (Hamel and Chiltoskey [1975](#)); the Hopi (Vestal [1952](#); Whiting [1939](#); Colton [1974](#)); and the Zuni (Camazine and Bye ([1980](#)). Indeed, Indigenous people worldwide used medicinal plants, picked with great respect, for healing many kinds of conditions (Turner [2005](#)).

Fluid Aboriginal marriage patterns created amicable relations with neighboring groups and were part of maintaining respect, reciprocity, and responsibility among and between diverse cultures. Traditionally, some Aboriginal Ethics’ marriage patterns allowed for multiple spouses, both for men and women, with marriages typically arranged by one’s relatives. Aboriginal Ethics sometimes allowed for extramarital relations. For example, when someone arrived at a village from somewhere else, his or her sexual needs were typically accommodated, often with the spouse offering his or her spouse to accommodate the newcomer out of respect for the newcomer(s). Such generosity was appreciated by settlers.

Lesbian, Gay, Bisexual, and Transgender relationships were traditionally supported by Aboriginal Societies throughout the world. The book *The Zuni Man Woman* (Roscoe [1991](#)) portrays the life of We’wha who was born in a male body but did women’s and men’s chores in women’s dress and was a member of a spiritual secret society and highly respected by the Zuni. We’wha was taken to Washington, DC by Milda Cox Stevenson in 1886. After returning home, We’wha stopped the

US army from invading her Zuni pueblo. Jacobs et al. (1997) and Roscoe (1998) portray more of the breadth of Native American transculture. African Aboriginal cultures also have transgender examples (Murray and Roscoe 1998).

Marriage relationships were sometimes created to assuage conflicts and create a kin relationship with someone one had offended. Mills (1994: 153) cites an example of the Witsuwit'en giving a daughter in marriage to someone offended in another clan in order to create a peaceful kin relationship with the offended party. In the Witsuwit'en matrilineal clan-based society, this meant the offended man's future children would belong to their mother's clan and have rights to her traditional territory, as well as to her father's traditional territory, that of the offender. However, such relationships did not always keep raids and attacks from occurring as the two following examples portray.

**Example 1** A Totem Pole at the Gitksan village of Gitwangak in Northwest British Columbia Canada depicts the story of a Gitwangak woman who had been abducted by the Haida from Gitwangak, returning home in a canoe with her baby using the tongue of his decapitated Haida father as a pacifier so the mother could paddle back to Gitwangak without anyone on Haida Gwaii hearing the baby cry. An eagle guided the mother from Haida Gwaii back to the Skeena River so she could return home (cf. Mills 2001, p. 315).

**Example 2** A Hartley Bay Tsimshian woman had a lance thrown by a Haida man that went right through her thigh when a Haida war party arrived at a beach where the Hartley Bay Tsimshian harvested seaweed. This woman was reborn as a babe with the birthmark on both sides of her thigh as a reminder of this assault. That babe became a Tsimshian Hartley Bay Elder who passed away around 1984 at an advanced age with the birthmark still on both sides of her thigh (Stevenson 1984).

Such reincarnation experiences are reported for Indigenous peoples throughout the world.

Evans-Wentz (1911) described reincarnation concepts among the Celts in pre-Christian times; Spencer and Gillen (1904) and Spencer (1966) for Australian Aborigines; Malinowski (1916) for the Trobriand Islanders; Von Furer-Haimendorf (1953) for an Indigenous tribe in north India; Mills and Slobodin anthology (1994) for Indigenous and Inuit people in North America. In Africa, Parrinder (1956), Besterman (1968), Gottlieb et al. (1998), and Stevenson (1985, 1986) have described reincarnation concepts and/or cases.

While war and conflict were and are recounted and recognized in Aboriginal Oral Traditions and Aboriginal Ethics, there are Aboriginal mechanisms to mitigate conflict. The four R's, respect, reciprocity, relevance, and responsibility (Kirkness and Barnhardt 1991) have been used in Aboriginal diplomacy since ancient times. Respect is deeply ingrained in the spiritual traditions and kinship systems of Aboriginal people worldwide; reciprocity is also part of sharing and exchange that typifies Aboriginal practices related to governance globally and is deeply tied to responsibility and taking on leadership or chiefly duties. Disputes were and are typically settled by the leaders or Hereditary Chiefs (Mills 1994; Ignace 2017). Indeed, the relevance of actions taken in regards to upholding ethical practices ensured harmonious and enduring relations.

Despite the impact of Aboriginal Ethics on creating democracy and women's rights, there are historical and contemporary difficulties of Aboriginal Ethics being respected by Settler Societies throughout the world. Indeed, Aboriginal rights have been impacted by colonization and the imposition of the Colonizers' Ethics.

There have been and continue to be difficulties of having Aboriginal Ethics respected by Settler Societies. Fluid marriage patterns were a part of Aboriginal Ethics.

While alliances and aid from the Aboriginal Societies was often key to the establishment of the colonizers' Settler Societies in Australia, New Zealand, North and Central and South America and Africa, the colonizing societies have typically not respected Aboriginal Ethics regarding Aboriginal rights to their way of life or their

traditional territories. Since colonization, many Aboriginal peoples in many continents and in Canada have been moved from their traditional territories onto small reserves based on the concept of *terra nullius* (RCAP 1996, p. 47). There has been a disregard from the colonizing societies for maintaining the integrity of the interconnection of all life forms. The damage from clear-cut logging caused the Gitksan and Witsuwit'en to go to court to preserve the integrity of their environment. Settler Society has also sought to wipe out Aboriginal languages through residential schools in Australia and Canada (Armitage 1995; Miller 2017; TRC 2015) and to some extent in the USA, as they saw their languages as part of an inferior culture. Only now are Indigenous peoples seeking to revive their traditional languages which embody their understanding of the importance of the deep spiritual interconnections of life forms (cf. Comaroff 1993 re Africa). This is despite the fact that the alliances between Aboriginal peoples and the freshly arrived newcomers were typically essential for the survival of the colonizers, who nonetheless felt entitled to take over Aboriginal Ethics, land and resources. Mann (2011) and Lepofsky et al. (2017) note that the huge decimation of the Aboriginal population from diseases introduced by settler society against which they had no immunity, greatly impacted Aboriginal peoples post contact.

Armitage (1995) noted that the conditions in and the goals of residential schools in Canada, Australia, and New Zealand were very similar, namely, to obliterate Indigenous culture. In Canada, residential schools sought to “kill the Indian in the Child.” Although residential schools were expected to teach Christian ethics, many children were sexually, physically, and/or emotionally abused, and many died, raising questions of whether residential schools caused cultural genocide (cf. Miller 1996). Brower and Johnston (2007) discuss issues of disappearing peoples among the Indigenous groups in South and Central Asia. The Truth and Reconciliation Commission of Canada (2015) produced a report with 94 Calls to Action designed to address the injustices created by the residential schools, although most have not yet been implemented.

In addition, much of Aboriginal Ethics was deemed “of the Devil” by Christian missionaries and western culture which viewed shamanic practices as demonic even when they effectively cured patients, including Father Morice (cf. Mills 1994). Dakelh Elder Sophie Thomas’ traditional medicine to cure cancer has been scientifically tested on mice and shown to be an effective cure for cancer (Ritch-Krc et al. 1996). The sophistication of Aboriginal knowledge of all aspects of their environments and their protection and use of them as a keystone to Aboriginal Ethics has been well documented but greatly underappreciated by western culture for a long period of time.

Aboriginal rights and ethics need to be considered in the context of contemporary research with Indigenous Peoples. The creation of ethical Aboriginal academic research has been aided by the growing presence of Aboriginal academics who advocate for Indigenous focused research practice and principles. Drs. Linda Tuhiwai Smith (1999/2012), Marie Battiste (2000, 2013, 2016), Battiste and Henderson (2000), Margaret Kovach (2009), and Shawn Wilson (2008) have articulated how to conduct research using Indigenous values and principles. Dr. Linda Tuhiwai Smith’s (1999) book *Decolonizing Methodologies: Research and Indigenous People* describes how research methodology can be inclusive of Indigenous knowledge so that a decolonized approach to knowledge production and understanding is attained. The First Nations Information Governance Centre (2014) set out the principles of OCAP (ownership, control, access, and possession) for Aboriginal communities to use to move forward with research agreements and frameworks to ensure their cultural and intellectual property is being protected under parameters determined by their own nations. Chapter 9 in the Canadian 2014 *Tri-Council Policy Statement: Ethical Research Involving Humans* gives guidelines for research with Aboriginal people, showing how community protocols of Aboriginal communities can be accommodated and respected in specific academic research agendas. Thus, Contemporary Aboriginal Ethics are slowly educating society about the necessity to have a mutual understanding about how research ethics can be

used so communities and community participants are respected. The Four Rs of respect, reciprocity, relevance, and responsibility presented by Kirkness and Barnhardt (1991) are inherent Aboriginal Ethics that need to be used as they embody an entire worldview that must be honored in a respectful way.

However, there are still considerable difficulties of Aboriginal Ethics being respected by Settler Society and industry. In North America, as on all the other continents, Aboriginal Peoples were given rights to small reserves which are tiny portions of their traditional lands. In Canada, the Nisga'a Calder Case, the Delgamuukw-Gisdaywa, and the Tsilhqot'in Court Cases in particular have been important but have not settled all the issues of territorial integrity and rights to preserve the territory from industrial damage. Aboriginal People find the environmental review process typically gives more credence to industrial development of pipelines, mines, and dams than to Indigenous rights and environmental concerns, producing catastrophes such as the Mount Polley spill in British Columbia, Canada (<http://www.cbc.ca/news/canada/british-columbia/mount-polley-mining-fears-1.4235913> August 4). Despite the increasing impact of climate change implemented by clear-cut logging, fracking, pipelines, and environmentally devastating mining practices, the environmental review process has yet to consider the Ethics of Aboriginal Peoples worldwide which relate to preserving the integrity and health of all forms of life based on their perception of their ecological and spiritual interdependence. Aboriginal Ethics would require that a sound environmental review process be implemented before fish-farms, mines, hydroelectric dams, and other environmentally impacting practices are allowed. Contemporary Aboriginal leaders are seeking to have such ethical impacts understood, assessed, and halted, as Wade Davis (2009) notes.

It is time for a change in western ethics to a more traditional and contemporary aboriginal ethics. It is important to note that while Aboriginal Ethics impacted the creation of democracy in America, many aspects of the original (pre-1492) Aboriginal Ethics have been judged

primitive, uncivilized, inappropriate, or necessary to obliterate by Eastern and Western cultures that currently dominate North, Central and South America, as well as Asia, Australia, and Africa, now recolonized by China.

Charles Mann's 2011 book *1491: New Revelations of the Americas before Columbus* portrays the richness of precontact Aboriginal culture and ethics which Western culture deemed worthy of obliteration. Similar richness existed in Aboriginal Ethics as practiced originally throughout the world. Lepofsky et al. (2017) and Turner et al. (2013) have documented the careful cultivation of plants practiced by Northwest Coast Indigenous peoples, noting that it is inappropriate to label them as simple "hunter-gatherers" as they cultivated and managed plants as part of their way of life, stating,

Our understanding . . . is particularly heightened by the unparalleled details of these places recorded by William Benyon (n.d.) in the Ts'msyen adaawx. The adaawx (true histories) and the ayaawx (laws) are historical recordings that provide evidence of ongoing occupation, spiritual and physical relationships, protocols, and traditional environmental knowledge about the land and people to which the Ts'msyen are socially and politically tied. The ayaawx are not laws created from humans engaging with this land; rather, they are the spirit of the land speaking and giving people the tools to live within its order and with each other. (Lepofsky et al. 2017, p. 456.)

Regarding the integration of Indigenous Science with western science, Johnson et al. (2016, p. 10) introduce the issue of articles that "explore the central philosophical concepts upon which Indigenous peoples' sustainability is founded, such that sustainability scientists might explore how these concepts could inform sustainability initiatives more broadly." In the current context, this is critical.

Richard Shweder (2004) has written an excellent examination of Western ethics' suppression of other societies' concept of ethics including human rights, in Chapter 3, "Moral Realism Without the Ethnocentrism: Is it Just a List of Empty Truthisms?" in the book *Human Rights with Modesty: The Problem of Universalism*. Shweder points out that non-Aboriginal Ethics sound laudable

but do not validly examine whether cultural practices are defensible and appropriate, as they contain deeply embedded assumptions of ethical rights that are not empirically defensible.

As Henderson (2008) and Hartley et al. (2010) note, it is time for the UN Declaration on the Rights of Indigenous Peoples, passed by the United Nations General Assembly in 2007 and subsequently slowly endorsed by almost all member nations, to become foundational in making the rights and ethics of Aboriginal or Indigenous Peoples respected and implemented worldwide. Sefa Dei et al. (2000) and Blaser et al. (2004) had already stated that Aboriginal Ethics should no longer be deemed as detrimental to development. Indeed, environmentally friendly forms of power offer the whole world a better economy and way of living that appreciates the need to look after the environment and all life forms (Ozog 2012). This process can ultimately aid business and professional ethics of all Nations and cultures to make wise decisions that respect the relevance of endorsing commitments towards the environment and its interconnected life forms on all continents for the benefit of all mankind.

Turner and Mathews (in press) also note that Aboriginal Ethics need to be endorsed more broadly, saying:

Humans have equal responsibilities to support ecosystems and the complex web of relationships that exist, and of which we are a part. Without our contributions to nature, the system will eventually deteriorate. In this scenario, humans are active players in cycles of “give and take,” and hold deep commitments towards other species, incorporating virtues of responsibility, respect, caring, gratitude, love and generosity. This view is embedded in the knowledge systems of Indigenous Peoples in many parts of the world, including across Canada, and is manifested through stories, ceremonies and intergenerational education, as well as in everyday actions. (page # to be determined)

“The Spirit in the Land” is a deep concept, articulated also by Gisday Wa and Delgan Uukw (1989) in their opening statements about their right to their Gitksan and Witsuwit'en Traditional Territories. Traditional Aboriginal Ethics embody the concept of respecting the Spirit in the Land and the deep reciprocal commitments that entails.

Turner and Mathews note that this is missing in Western Ethics, which needs to be replaced by “a philosophy of relatedness and reciprocity, [that] embodies an understanding that we humans are an integral part of nature and natural systems, that animals, plants and even mountains and rivers, considered non-living within western taxonomies, are our kin, ‘our relations.’ It is our role to ‘give back’ to our non-human relations.” (in press, now p. 3).

It is important to note all people would benefit from applying these Aboriginal Ethics wherever they live.

## Academic Business Ethics in the United States

Jeffery Smith

Seattle University, Seattle, WA, USA

## Introduction

The formal study of business ethics in the United States – unlike many disciplines in business schools – has emerged slowly, if steadily, over the last four decades. Its most identifiable origins begin in the early 1980s with the emergence of dedicated faculty and curricula in the area of business ethics as well as in the allied fields of corporate responsibility and business in society. This trend was notably marked with the appointment of philosophers and management scholars to endowed chairs in those fields at prominent universities. Since that time, a wider range of colleges and universities have moved more deliberately to create specific academic programs, co-curricular institutes, and stand-alone departments in business ethics.

## Research Centers

The two most prominent places for the academic study of business ethics in the United States are currently in the halls of the Wharton and Darden Schools at the University of Pennsylvania and

University of Virginia, respectively. Both of these schools either house a dedicated department to business ethics or offer well-structured ethics concentrations for master's and Ph.D. students. Both schools also advance the field of business ethics through research centers. Darden's Olsson Center for Applied Ethics describes itself as a "critical resource for executives, scholars, students and Darden alumni who are faced with the challenges of integrating ethical thinking into business decision-making." This mission reflects the Olsson Center's emphasis on original research and academic training that informs, and is informed by, business practice. Wharton's Carol and Lawrence Zicklin Center for Business Ethics Research is less managerial and slightly more theoretical, leveraging faculty strengths in areas such as normative ethics, philosophy of law, and corporate governance (Orts 2013).

The influence of these programs can be measured in two ways. First, due to Darden and Wharton's emphasis on business ethics, many universities with business ethics programs have a direct connection to their faculty and graduates. Within the last two decades, for example, Darden and Wharton graduates, as well as former faculty from these schools, have provided academic leadership in the area of business ethics at universities such as George Washington University, the University of Richmond, the University of Notre Dame, Georgetown University, Franklin and Marshall College, Santa Clara University, the State University of New York, the University of St. Thomas, and Carnegie Mellon University, just to name a few.

Second, both programs reflect dominant methodologies within the field of business ethics. Darden's faculty, notably led by R. Edward Freeman (2010), have played a preeminent role in the development of stakeholder theory and stakeholder capitalism, which maintains that responsible management should strive to adopt creative strategies to "create value" for all business stakeholders rather than merely for investors. While not uniquely a theory for business ethics, stakeholder theory remains practically aligned with many questions about the effective means and ultimate aims of management, which provides

foundational answers to many ethical questions. Organizations such as the Business Roundtable and the World Economic Forum have embraced variations of this idea and are arguably indebted to stakeholder theory's development at Darden. Its orientation around stakeholder theory remains a driver of ethics education within management departments that seek to merge fields such as organizational behavior, strategy, and entrepreneurship with ethics. Stakeholder theory has many affinities with other management-centered approaches to the study of business ethics, notably earlier scholarship in corporate social responsibility; however, its enduring normative, strategic, and rhetorical power over the course of the last three decades clearly makes it a preeminent movement with the field.

Wharton has a long-standing history of research and thought leadership in normative business ethics. A fine example of this is Thomas Donaldson and Thomas Dunfee's (1999) pioneering application of social contract theory to norms of business conduct. Other current or former Wharton faculty continue to examine the implications of moral and political philosophy on issues such as corporate personhood, workplace equality, business involvement in politics, the foundations of business regulation, and corporate criminal liability (Seginwall 2013).

Other research universities have taken on business ethics as a dedicated area of study. Indiana University, Rutgers Business School, Harvard Business School, the Pennsylvania State University, and the University of Pittsburgh are examples of noteworthy institutions supporting interdisciplinary scholarship in business ethics – spanning law, philosophy, political theory, economics, and management – that has pushed the boundaries of contemporary research in the field. Central questions addressed by faculty within these institutions includes corporate social responsibility, which grapples with the strategic dimensions of corporate involvement in addressing large-scale social and environmental problems, both domestically and globally, and moral psychology, which seeks to answer questions about the ethical behavior of individuals within different social settings (Hsieh 2006;

Treviño et al. 2017). This latter area of research reflects a long-standing commitment among business faculty at research universities to study ethics as part of a larger portfolio of inquiry in organizational behavior.

## Other Universities

Another important dimension of the study of business ethics in the United States is the role of Catholic universities in prioritizing the study of ethics within academic business programs. Many high-profile scholars in business ethics, including Donaldson and Patricia Werhane, began their work at Catholic institutions; moreover, Catholic institutions continue their noteworthy commitment to ethics education as part of their missions to promote social justice, educate the whole person, and endeavor to build students' professional identities around a commitment to the common good. Larger Catholic universities, such as Notre Dame and Georgetown, have had a long history of supporting endowed research chairs and separate institutes to support the philosophically led study of business ethics and corporate responsibility. This orientation continues today at other Catholic business schools at universities such as Loyola University Chicago (Singer 2018), DePaul University (Koehn 1995), St. Thomas, Santa Clara (Valesquez 2012), Duquesne University, Creighton University, Seattle University, Fordham University, and College of the Holy Cross.

Since the rise of academic business ethics in the early 1980s, Bentley University – a university that identifies business education as a unifying theme across multiple disciplines – has played an outsized role in building bridges between academic business ethics and the “real world” of business practice. W. Michael Hoffman's launch of Bentley's Center for Business Ethics in 1976 served to acquaint university administrators, faculty, and business leaders to the idea that the study of business ethics was something about which professors and managers could learn from each other. Hoffman's own work also included a successful effort with Donaldson to unite business ethics scholars in to their first organized

association, the Society for Business Ethics, which today still serves as the major academic society promoting the study of business ethics and publishes the leading journal *Business Ethics Quarterly*. The Center at Bentley, now named in honor of Hoffman, still retains annual lectureships in business ethics, a close relationship with ethics and compliance officers from industry, offers special programs in conjunction with the Ethics and Compliance Initiative, a Washington DC-based think tank dedicated to corporate ethics and compliance that trains practitioners on the management of ethical business cultures, and publishes the journal *Business and Society Review*.

## Dedicated Departments in Business Schools

As business ethics has grown in importance within business schools since the early 2000s, there has been a growth in dedicated ethics departments within schools of business. The dominant trend in this area is to take ethics faculty out of departments of (typically) management and unite them in joint departments of ethics and business law. This administrative shift reflects a renewed attention to interdisciplinary degrees and certificates in the areas of ethics, compliance, and corporate social responsibility. Fordham and St. Thomas are interesting cases of this trend; both have assembled a large number of academic and clinical faculty in ethics and law as well as supporting academic programs in organizational compliance. The Kelley School of Business at Indiana University and the Daniels College of Business at Denver University have adopted a model reminiscent of Wharton's. They are more recent examples of universities that have developed educational programs focused on social responsibility that conceive of the study of law as an institutional component in the broad-based study of the role of business in an increasingly global society.

The McCombs School of Business at the University of Texas does not have a dedicated department to ethics; however, it has served as a model for schools interested in establishing departments in the area of business and society. Its Department

of Business, Government and Society “focuses on research and teaching on the regulatory, political, legal and ethical environment of business” and reflects the fact that many management scholars who are interested in certain dimensions of stakeholder theory, business ethics, and corporate responsibility self-identify as scholars in “business and society,” focusing their work on the social, political, and legal environment in which business takes place. Many American scholars working in this space are active members in the International Association of Business and Society (IABS), publisher of the journal *Business and Society*.

Academic movements within the field of business ethics over the last 40 years have been focused both on applied research and the development of university curricula. The attention of faculty and university administrators on the field of business ethics has waxed and waned during this period; nevertheless, progress has been consistent, if measured in terms of: (a) the number of graduate programs dedicated to the study of business ethics; (b) research institutes in business ethics; (c) the number of faculty with research programs dedicated to business ethics; and (d) and the rise of dedicated departments in the field. In 2004 the Ethics Education Task Force of the Association to Advance Collegiate Schools of Business (AACSB) recommended that business schools “strengthen ethics components” in the curricula and provide students with “frameworks that...help in resolving ethical business and managerial problems” as well as courses that “lay out the larger societal context in which business operates.” These conclusions arose out of a call within the academic business community to articulate and fine-tune what many American business schools had successfully begun (DeGeorge 2015).

## Academic Ethics and Academic Integrity

Deborah C. Poff

Brandon University, Ottawa, ON, Canada

## Synonyms

Research and scholarly publishing; Responsible conduct in teaching; Scholarly integrity; Teaching ethics/research ethics

## Introduction

Academic Ethics and Academic Integrity refers to responsible and ethical conduct in university-based teaching, student performance, research, and in the dissemination of research through publishing. The history of Academic Ethics might be considered opaque given the breadth of what can

meaningfully be considered relevant to the topics that will be discussed in this entry. While this may be true in terms of long-term historical roots, this is not the case with respect to the contemporary discussion of academic integrity from the latter part of the twentieth century until now, both with respect to teaching and to research practices. This article will address these matters.

Some would begin any discussion of academic integrity with an introduction to the literature on the purpose of a university. This is a topic in itself so it will only be noted here that a recurrent theme from the ancient Greek philosophers to the scholarly discussions of the topic in the twenty-first century have focused on the purpose of education not only as an end in itself but as a means to higher order goods, such as educated leadership, education for the common good, and education for engaged citizenship and the promotion of democracy. To focus on just two iterations of some of these thoughts, nineteenth-century utilitarian, John Stuart Mill (1863) argued that broad-based education would lead to an understanding and appreciation of higher order goods which, in turn, would lead to choices among citizens that result in an increase of happiness for the greater number of persons. Similarly, John Dewey (1916) argued for education for the purpose of advancing citizenship engagement and democracy.

Certainly, the ancient Greeks discussed education in the context of examining the nature of what is a good person or what is a good society, or more broadly, what is the purpose of life for persons. This, in turn, meant understanding the nature of goodness. In the contemporary context, this discussion becomes more directly articulated in terms of university policies and practices concerning ethical behavior with respect to teaching and research.

### **The Modern University and Teaching and Research Ethics**

While the debate continues concerning the role of universities in educating students for professional careers and/or to be better citizens in the nation states, one thing is clear. For the past two decades universities have become focused on teaching,

research, and publication ethics for students and faculty within these institutions.

### **Contemporary Academic Integrity**

As noted above, contemporary academic integrity refers to ethical issues in teaching, research, research dissemination and publication, and university policies and practices, including the governance of universities.

In this entry, all aspects of Academic Integrity will be discussed separately.

### **Teaching and Ethics in the Contemporary University**

There are a number of aspects related to teaching and ethics and a number of stakeholders who participate in teaching and learning.

### **Teaching Faculty**

One aspect in addressing teaching and ethics focuses on the requirements for being an ethical teacher. There are a number of different separate distinctions to be made here. First, there is the issue of competence. As I have argued elsewhere (Poff 2003), university teaching is a profession that initially requires advanced education and specialization within a particular field. Professions generally have a number of requirements that are related to being a specialist within a field. I have referred to these as: competence, calling, courage, and commitment. Competence is not only the achievement of the doctoral degree which is standardly the necessary educational level for university instructors but also a commitment to continuing professional development through research in order to stay abreast of the field. At most universities, this also carries with it a requirement to undertake research to also further the discipline through research projects that result in the dissemination of new knowledge. Calling involves a passionate engagement with teaching and research of knowledge and a belief that university education and research is critically

important. This is related to a further commitment which involves living up to a calling through quality teaching, a further commitment to student success, and a commitment to furthering the discipline through research and publication. It calls on teachers to care about the students who enroll in their classes and be committed to the purpose of university education. Courage requires sticking to principles of teaching and research integrity even when there are various forms of external pressures to deviate from these principles.

While there is generally very little demanded by universities in terms of mandatory requirements to maintain these types of attributes or characteristics, many universities have developed Centres for Teaching and Learning to provide professional development opportunities on campuses to improve faculty teaching. There are also organizations and professional associations which have established codes of good behavior for university teachers or ethical principles in university teaching. The Society for Teaching and Learning in Higher Education lists nine such principles (1996, STLHE/SAPES). Briefly, the domains of the document include: (1) Content Competence, (2) Pedagogical Competence, (3) Dealing with Sensitive Topics, (4) Student Development, (5) Dual Relationships with Students, (6) Confidentiality, (7) Respect for Colleagues, (8) Valid Assessment of Students, and (9) Respect for Institution.

While all of the principles and Poff's (2003) characteristics are ideal and laudable, they are not always met in part or in toto by all university faculty. The corrective approach generally is the aforementioned teaching and learning centers as well as the establishment of professional associations like the International Center for Academic Integrity and the European Network for Academic Integrity.

## Students and Integrity in Learning and Performance

Ethics regarding university teaching is only one side of a serious matter for academic integrity. As well, professional associations concerned with

teaching spend considerable time with respect to violations of integrity in students' learning and performance evaluation behavior.

Student cheating on evaluative assignments is not a new phenomenon, but systematic evidence show that a majority of student cheating has been systematically studied and measured for the past three decades with increased amounts of published research in the area since the 1990s.

Many universities provide lists on their websites to inform and educate students about the different forms of cheating that are considered serious violations of appropriate student conduct and which result in various types of disciplinary action up to and including expulsion from the university either for a specified period of time or permanently.

St. Petersburg College offers one such list (URL: <https://spcollege.libguides.com/avoidplagiarism>):

- Cheating
- Bribery
- Misrepresentation
- Conspiracy
- Fabrication
- Collusion
- Duplicate submission
- Academic misconduct
- Improper computer/calculator use
- Improper online, teleweb, and blended course use
- Disruptive behavior
- Plagiarism

Plagiarism is considered the most common type of cheating. As well, it should be noted that cheating is a generic term in the above list which includes some of the particular categories listed here. For example, bribery is a type of cheating where students offer money or services in exchange for someone else's paper, or in the case of a student bribing a professor, it may be money in exchange for grades. One other common form of cheating is contract cheating where students access papers for sale on the web through a pay for paper commercial service.

While this entry will not provide a detailed explanation of every type of cheating behavior,

the sheer volume of plagiarized materials by students warrants further detail. Plagiarism by students (a nuanced and more elaborate definition with faculty research and publishing will be dealt with later in this article) is variously called “stealing” someone else’s ideas or work; copying someone else’s work without references or proper citation of the source of the ideas; acting as if or “pretending” that someone else’s work is one’s own. In much of the research, a large number of students or a majority of students admit to plagiarizing or other forms of cheating. Plagiarism may be dominant because it is relatively easy to commit plagiarism just by copying a published article or someone else’s work. (Some universities use software that looks for plagiarized material with variable levels of success.)

One of the more prolific researchers on plagiarism and other forms of student cheating was Donald McCabe. From 2002 to 2015, McCabe did numerous studies on the frequency, type, why, and how of student cheating as well as an exploration of how to change student behavior and attitudes toward cheating in universities (McCabe et al. 2012). Much of this work was done for the International Centre for Academic Integrity. Statistics cited from McCabe’s work and included on the website of the Centre in trends from his research over the years are included here (Table 1).

In addition to McCabe’s work, there is a plethora of studies over the past two decades on the nature and frequency of plagiarism and other forms of cheating among university students as well as examples of interventions to lower the incidence of cheating (see Young et al. 2018; Orr Jr 2018; Henning et al. 2018; Wei et al. 2014).

### Attempts at Amelioration

Education is one of the key approaches to address plagiarism and other forms of cheating in educational institutions as indicated by the information listed in many university calendars and academic policy and practices. As well, it is common practice for teaching faculty to reference university

**Academic Ethics and Academic Integrity, Table 1** The statistics below are just a snapshot of overall trends uncovered over the past 12 years

|                                             | Graduate Students | Undergraduates <sup>a</sup> |
|---------------------------------------------|-------------------|-----------------------------|
| Number responding                           | ~17,000           | ~71,300                     |
| % who admit cheating on tests               | 17%               | 39%                         |
| % who admit cheating on written assignments | 40%               | 62%                         |
| % total who admit written or test cheating  | 43%               | 68%                         |

<sup>a</sup>Excluding first year students, code schools, and 2 year schools

policy and the range of disciplinary action which follows confirmation of cheating behavior. Additionally, as referenced in McCabe et al. (2012) a number of universities institute honor codes for students to commit to academic integrity in their studies. Finally, as noted above, some universities utilize software programs, such as Turnitin, to catch students who plagiarize.

### Faculty Research and Publication Ethics

While this entry has already identified characteristics with respect to the profession of university faculty, specific attention has been focused on the university faculty members as researchers and as disseminators of scholarly research through publication in formats like journal articles and monographs. The values underlying research and dissemination include both the identification of generic positive normative values like rigorous methodological practices and the identification of forms of particular violations of research integrity and publication ethics.

The values approach not only includes explicitly ethical theories and principles of practice but also nonmoral knowledge-based norms, such as methodological rigor, proper citation practice, and other practices that fall under the rubric of the responsible conduct of research. Governments in particular have focused on risk management, addressing allegations of misconduct, utilizing disciplinary approaches to guarding the public

interest and in the prudent and lawful utilization of the public funding of scholarly research and in protecting the integrity of the scholarly record. University risk management has undoubtedly had an impact on university academic administrators, given their roles in managing reputational risk factors, building universities, and managing the incursions of governments and local communities into evaluating the roles and responsibilities of universities.

## Violations of Research Ethics and Publication Ethics

This encyclopedia has numerous entries which explicitly discuss many of the standard violations of research ethics and examples of publication ethics (see “[Cross-References](#)”). Consequently, this entry will only briefly identify the most commonly recognized issues. These include:

1. Plagiarism, falsification, or fabrication of data (which arises during the conduct of the research and is subsequently published as original and properly validated data in research).
2. Text-recycling, self-plagiarism, redundant publication, and salami-slicing (various overlapping issues related to unethical attempts to redundantly try to multiply the number of articles published from the same text, the same data, the same research study, etc.).
3. Authorship issues (such as):
  - Ghost authorship where someone writes an article for the author(s) without acknowledging that this is the case, for example, where a commercial funder ghost writes research which they funded.
  - Gift authorship where an author(s) is added to an article for various unethical reasons, such as increasing the chance of having an article published.
  - Removing an author where the author contributed as an author to the article, monograph, etc. This sometimes happens where a dispute arose between or among authors or where an author wishes to claim that she or

he is the lead or only author deserving of authorship.

4. Conflict of interest in which the interest of accurate scientific results is compromised by some commercial interest or the personal beneficial interests of a researcher.
5. Reviewer misconduct where the reviewer of either the research proposal or the publication submitted is not ethically reviewed (such as):
  - Friends review articles not acknowledging conflict of interest.
  - Reviewers “steal” unique ideas in reviewed material and use for their own research.
  - Reviewers do not spend the time to adequately review the material and still make recommendations to accept or reject.
  - Reviewers accept articles/monographs to review that they are not qualified to review.
6. Author misconduct where an author knowingly publishes research with predatory publishers in which research is not peer reviewed but is published by corrupt commercial presses that run publications solely to make money.

While there are more distinct misconduct issues in research and publication which might be identified, these are the most common and mostly identified by government research funding agencies and by university policies regarding ethical misconduct in university research and publications.

## Summary

This entry has provided a broad overview of ethics in teaching, research, and publications as part of key mandates of the purpose of a university.

## Academic Integrity and Business Ethics Teaching

Caroline Burns

Saint Mary’s College of California, Moraga, CA, USA

## Synonyms

Academic dishonesty; Business ethics pedagogy; Cheating; Honor codes. AI

## Introduction

Much as business must pay attention to ethics in the post Sarbanes–Oxley era and create ethical cultures and compliance systems, business schools must create ethical cultures, though honor codes and systems, and by teaching integrity and ethical decision-making (McCabe et al. 2006). Teaching college students to act ethically and to understand the costs of acting unethically is vital (Guerrero-Dib et al. 2020). The unethical business student behavior is a problem for the business community. Addressing unethical academic behavior among students will have long-term impacts on their postgraduation ethical behavior; it is unlikely that a student who regularly fails to act with integrity in an academic setting will become a worker who acts with integrity on a consistent basis. Indeed, research shows academic integrity and academic misconduct predict the ethicality of graduates (McCabe et al. 2006). Moreover, interventions among students will have greater impact than interventions they were to receive after graduation. Granted, there are challenges to priming students for ethical behavior both during college and postgraduation

(Bratton and Strittmatter 2013) and there are never guarantees of success (McCabe et al. 2006).

Students' ethical decisions in their lives outside of school, much like their decisions whether to engage in academic misconduct, reflect their personal ethical code (Mihelič and Culiberg 2014). Students arrive to higher education with such codes established, but their higher education experience can influence their values and attitudes. Academic integrity and academic dishonesty are topics that relate to ethical decision-making that will resonate with students' regular experience. Thus, business ethics courses should openly discuss the prevalence of academic misconduct in educational and business settings (Hsiao and Yang 2011). Promoting academic integrity will also make education more effective and efficient, even as it contributes to a more humane and fair society through students' post-graduation behavior (Guerrero-Dib et al. 2020).

## Definitions

There is a multitude of definitions of academic integrity. The International Center for Academic Integrity (ICAI) defines academic integrity as a "commitment to five fundamental values: honesty, trust, fairness, respect, and responsibility" (2013.) Similarly, the European Network for Academic Integrity (ENAI) defines it as "compliance with ethical and professional principles, standards, [and] practices and [a] consistent system of values," noting that this system "serves as guidance for making decisions and taking actions in education, research and scholarship" (ENAI 2018). Likewise, ENAI defines academic misconduct as "any action or attempted action that undermines academic integrity and may result in an unfair academic advantage or disadvantage for any member of the academic community or wider society."

McClung and Schneider (2015) have developed a comprehensive list of student behaviors related to academic dishonesty, which includes: discouraging whistleblowers; cheating and supporting cheating; assistance concerning the

mechanics of writing; failing to follow set guidelines, rules, or stated expectations for assignments, exams, or peer grading; creating or providing false or inaccurate information; plagiarism and supporting plagiarism; recycling academic work; and sabotaging peers.

## Extent of the Problem

Students do not always practice academic integrity. Whether business students cheat more than others is unclear as there are conflicting research findings on this matter (Klein et al. 2007; McCabe et al. 2006). The win-at-all-costs worldview that is pervasive in business may increase academic dishonesty among business students. In any case, business students clearly cheat; studies of academic misconduct among them find rates as high as 60–92% (Martin et al. 2009).

On the one hand, Klein et al. (2007) studied cheating among business students and students majoring in other professional degrees (including criminal justice and nursing). They found that rates of cheating were just as high in other fields as business, but that business students' professed beliefs about cheating suggested a particularly relaxed view of it. On the other hand, McCabe et al. (2006) found that 56% business students acknowledged they had committed some type of academic misconduct in the preceding year while only 47% of their nonbusiness peers had. Rakovski and Levy (2007) examined self-reported ethical behavior among business students and found that management majors were the least ethical in general and accounting majors the most ethical. The former were particularly likely to take credit for others' work or take shortcuts.

Rakovski and Levy (2007) also studied students' impressions of the appropriate punishments for academic dishonesty. Results indicated that students felt they should not be punished for helping others to cheat, especially if it was unknowingly. For example, they assigned mild punishments to those who might share work without knowing it would be submitted or allowing a peer to copy one's homework or copy from an

exam. Likewise giving others help, receiving help, and failing to cite internet sources were rated the mildest. They assigned stronger punishments to those who stole exam answers, submitted someone else's work, knowingly allowed someone else to submit their own work, or used a crib sheet. This would indicate that students see academic misconduct on a continuum. This perspective suggests that students might easily justify unethical behavior to themselves and others at school or at work when it suits their purpose.

Business students also believe that they are more ethical than businesspeople (Martin et al. 2009). Assuming the majority of them are engaging in academic misconduct as studies show, this implies they must be able to justify academic misconduct. They may see it, at worst, as a necessary evil. They may adapt to an unethical workplace culture just as readily if business schools do not teach them ethics.

A host of research connects academic ethics to business ethics by studying students' attitudes and actions. For example, Nonis and Swift (2001) found a correlation between how much students cheated at school and calling in sick when not sick, completing personal business on company time, giving preferential treatment to family/friends, taking office supplies for own use, and telling partial truths to cover up other people's mistakes. Likewise cheating in college by Taiwanese business students predicts unethical behavior in the workplace after college (Hsiao and Yang 2011). This also indicates that the issue is global. The same study found that among students who have spent time in the workforce before college, beliefs about ethical behavior in the workplace predict academic misconduct. Students who consider academic honesty to be important are highly likely to see business ethics in the same light (Bratton and Strittmatter 2013). Similarly Shin and Alecci (2014) found that students who were more likely to cheat on exams considered unethical employee behaviors to be more acceptable than those students less likely to cheat. Guerrero-Dib et al. (2020) studied the interaction between academic misconduct and unethical behavior at work among a sample of

Mexicans and found the same type of link between attitudes. Given this weight of evidence, the fact that academic dishonesty is widespread is very troubling and bespeaks enormous harm to society if business schools do not address academic integrity and teach business ethics.

### **Business Ethics Courses with an Academic Integrity Focus**

Given the connection between academic integrity and business ethics, the fact that business ethics courses are designed to minimize unethical behavior postgraduation makes them a natural choice for teaching academic integrity. There is also evidence that teaching academic integrity in business ethics courses will improve the teaching of business ethics itself. Academic integrity is a real life ethical dilemmas students face in their daily lives. Given that a business ethics course must offer a controlled and safe setting, there is no way to get closer to their likely experiences in the workplace.

The necessary context for courses that teach academic integrity is an institution that values it. Honor codes have been prevalent in post-secondary settings as a tool to discourage cheating for decades. Students should receive copies of their school's honor codes before classes begin each year and professors should re-introduce such codes in the early sessions of their courses (Mihelič and Culiberg 2014). It is also necessary for institutions to enforce such codes through punishing violations and making them difficult to commit, as enforcement will strongly affect individual behavior (Hsiao and Yang 2011). Likewise, Guerrero-Dib et al. (2020) call on institutions to punish academic misconduct. Failures of enforcement teach students that ethics are unimportant. In fact Martin et al. (2009) found that high scores on measures of integrity and responsibility were *negatively* correlated with the likelihood of plagiarizing in a context where plagiarism was common, suggesting that academic dishonesty can become so normalized that students consider it acceptable and ethical behavior.

Thus, it is also necessary to communicate clearly the punishments for academic misconduct (Hsiao and Yang 2011).

Instructors are a major factor in shaping a context that supports academic integrity, as educators should model such behavior (Bratton and Strittmatter 2013). Simkin and McLeod (2010) found that students who were less inclined to cheat took their cue from role models such as ethical professors. One way instructors can model academic integrity is by diligently enforcing the academic integrity policies put in place and not cherry picking parts of the ethics codes to enforce or ignoring academic misconduct among some students. They can also model ethics through thorough citation practices and including bibliographies in class presentations and all other contexts where they might apply.

Once they are teaching in the proper context, business ethics instructors can deploy an array of tools to successfully teach their students to pursue a path of academic integrity. The most powerful may be frequent discussions regarding the ethical standards for the class and other academic contexts, as studies show they invite students to contemplate those standards, which makes it easier for them to apply especially when the temptation to cheat arises. Guerrero-Dib et al. (2020) findings suggest that a general discussion about academic misconduct is all that is required; addressing each type of misconduct does not create any added benefit in discouraging academic misconduct. Other pertinent tools include:

- During the period in a business ethics course where students would ordinarily learn about the use of business codes of ethics, they can learn that building an ethical environment requires having an ethics code. Using an academic ethics code as a proxy for this lesson can be powerful. Students could also develop their own code, and they are better equipped to create academic ethics codes than business ethics codes.
- Most business ethics courses use ethical decision-making models as a teaching tool. Academic integrity can play a central role in

such models – the role that corruption, harassment, and pollution would play in a model designed for business.

- Another common tool used to teach business ethics is the case study method. Case studies give instructors the opportunity to present the complexity of ethical decisions as well as how individual choices to behave ethically affect society (Mihelič and Culiberg 2014). Academic integrity can be easily be used as the unethical behavior under review.
- Finally, in-class debates where teams of students would deliberate on the ethical or unethical nature of a given academic behavior can increase student contemplation of ethical issues (Mihelič and Culiberg 2014). Business ethics courses often debate each other on the ethicality of issues such as paying expedition fees or using child labor; using academic misconduct as a topic for debate could follow this model.

There may be other tools as well, and business ethics professors would do well to contemplate how all of the tools they use regularly can make the connection between business ethics and academic ethics.

## Conclusion

Given the prevalence of scandal in the business world, individuals charged with training the future business leaders of America must pay attention to their students' moral development (Rakovski and Levy 2007). This is particularly important given that students' ethical beliefs about academic behavior predict their actions in the workplace (Bratton and Strittmatter 2013). McCabe et al. (2006) argue that students are still shaping their ethical codes and that teaching them to uphold standard of academic integrity will have positive effects on their behaviors in a business context. As such, business ethics instructors must build academic integrity into their courses; not to do so would miss a great opportunity to benefit their students, institutions, and society.

## Academic Integrity and University Corporate Accountability

Sarah Elaine Eaton

University of Calgary, Calgary, AB, Canada

## Synonyms

Accountability; Ethical behavior; Ethics; Integrity; Justice; Trust

## Introduction

Academic integrity is the foundation for ethical decision-making in life, including in the work environment. Academic integrity is more than the absence of misconduct; it is based on a set of values intended to guide learners toward ethical behavior on a consistent basis. The ethical decision-making skills students learn in school can – and should – be transferrable to their employment after they leave school (Bolívar 2005; Guerrero-Dib et al. 2020). In this chapter, I show how academic integrity is related to ethics and corporate accountability, exploring the roles of education, employers, and professional associations.

## Understanding the Connection Between Academic Integrity and Corporate Accountability

Understanding the connection between academic integrity in school and workplace ethical decision-making is important for educators and employers alike. Studies over time have shown that students who engage in academic misconduct in school are more likely engage in professional malpractice (Guerrero-Dib et al. 2020; Bolívar 2005). One study found specifically that students who cheated in school were more likely to engage in theft, illegal drug use, and workers' compensation fraud (Lucas and Friedrich 2005), which

could have not only ethical, but also financial repercussions for the employer. Poor decisions on the part of employees can impact corporate accountability because when violations occur in the workplace, the negative repercussions can not only ripple throughout the organization, but beyond it into the broader society.

## The Role of Education

Educational institutions and those who work in them set the stage for ethical decision-making through policy and practice. It is incumbent upon educators to teach the skills and principles associated with academic integrity. Research in one study showed that academic integrity became more important to them when they were in a teaching role compared with when they were students, in part because they were not explicitly taught expectations for ethical decision-making when they were students (Austin et al. 2005). It is imperative for educators to show the link between academic integrity in the classroom and ethics in the workplace so students understand the two are connected (Austin et al. 2005; Harding et al., 2004; Israel and Drenth 2016; LaDuke 2013).

In addition to promoting ethical decision-making through academic integrity, institutions also need policies and procedures in place to address misconduct (Bretag et al. 2011; Eaton 2021). There are five core elements of exemplary academic integrity policy: access, approach, responsibility, detail, and support (Bretag et al. 2011). *Access* refers to how easy it is for people to find, access, and read the academic integrity policies. Policies related to academic integrity should be readily available and easy to understand. *Approach* refers to the principles and values that underpin the policy. An educational approach to academic integrity policy is preferred when possible, emphasizing the need for students to have an opportunity to learn from their mistakes (Bretag et al. 2011), but of course, provisions must also be made for those who knowingly or consistently fail to follow the rules (Eaton 2021). The

third policy principle is *responsibility*. Policies should outline clear responsibilities for relevant stakeholders including students, management, staff, and faculty. Academic integrity is not only a matter of student conduct, but expectations must be established for all members of the academic community act with integrity, including when breaches occur (Bretag et al. 2011; Eaton 2021). Detail is the fourth principle of exemplary academic integrity policy (Bretag et al. 2011). Academic integrity policies should provide details and examples, with clear processes and flow charts to show how policy is implemented (Bretag et al. 2011). The level of detail should be extensive, without being overwhelming (Bretag et al. 2011). The final academic integrity principle is *support*. Policy support means having systems and resources in place to support the implementation of the policy. This includes, but is not limited to, training, seminars, and professional development for students and staff alike (Bretag et al. 2011).

Educational institutions can pay specific attention to the ways in which ethics is part of corporate accountability. If companies are to be held responsible for their impact on people and the planet, then educational institutions can set the stage for this by ensuring that sustainability, environmental impact, and social responsibility are infused across the curriculum. It is essential that students receive both philosophical and practical training about the importance of sustainability, climate change, human rights, and ethics throughout their education.

Educational institutions not only offer students training, but also provide students with opportunities to develop their own ethical standards. Then, when students enter the workforce they can be better prepared to ask tough questions of their employers that will help to ensure that corporate accountability is not only maintained through external scrutiny, but internally as well.

Taking a proactive approach to promote academic integrity as an expectation across the educational institution is key (Bretag et al. 2011; Eaton 2021). Having policies and systems in place to ensure breaches of integrity are addressed

is equally important. This sets the stage for students to understand that when they enter the workplace, there are consequences for misbehavior, particularly if it is intentional.

## The Role of Employers

Like educational institutions, employers need policies and procedures in place to investigate and address misconduct of all kinds. If educational institutions take an educational approach whenever possible when breaches of integrity occur, then students should be prepared to face progressive discipline in the workplace for breaches of ethics. Misconduct within the workplace can be further scrutinized by regulatory and professional associations, as well as the media, the courts, and government regulatory bodies (Israel and Drenth 2016). Providing regular training related to integrity as an organizational value can reinforce expectations for ethical behavior on a regular basis. It is imperative that ethics not only be a matter of regulatory compliance, but also as a matter of professional practice (Israel and Drenth 2016).

Employers can develop systems to protect whistleblowers who bring forward cases of misconduct, to track and manage information related to misconduct cases, and to ensure transparency in their processes (Israel and Drenth 2016). It is imperative for employers to develop cultures of integrity and systems to address breaches of it that go beyond mere lip service. This requires an ongoing commitment of resourcing, including personnel whose roles are focused on ensuring ethical decision-making is an employer expectation.

An organizational emphasis on ethics can be communicated in both internal and external communications on a regular basis. In addition, including one or more questions during the hiring process to determine how well a prospective applicant is likely to align with organizational expectations of ethics and accountability can set the stage for employees before they are even hired.

Employers also have a role to play with regard to educational institutions. Educational institutions often have program advisory committees

that include external industry representatives. These industry representatives are in a position to influence educators, curriculum developers, and academic leaders to ensure that ethics, sustainability, and accountability are infused into the curriculum and that academic integrity is an educational priority. Similarly, when industry representatives are invited to take part in education-related activities such as judging business case competitions, giving guest lectures, or participating as audience members for student project showcases, emphasizing integrity in every interaction with educational institutions and programs is an important way to convey organizational values related to ethical decision-making.

Employers are also accountable to the professional bodies that oversee quality and standards. It is up to employers to ensure that they hire individuals who demonstrate a commitment to ethical standards and values. Then, it is incumbent upon employers to ensure that ethical decision-making is an expectation that is upheld through training and daily workplace conduct.

## The Role of Professional and Accreditation Bodies

Professional bodies, including those that regulate and oversee conduct across an industry, place an essential role in ensuring that academic integrity is a foundation for workplace ethical decision-making. Professional bodies can ensure that academic integrity is demonstrated in academic programs that lead to a qualification to enter the profession.

One discipline-specific example is engineering. Academic researchers with disciplinary expertise in engineering have demonstrated a link between academic misconduct in school with professional misconduct (Harding et al. 2004). Today, engineering professional bodies require that schools demonstrate how they promote integrity and take steps to minimize misconduct as part of the program accreditation process. One example is Engineers Canada (2021), the professional body that oversees standards for more than 300,000 professional engineers across the country. As part of their accreditation process,

Engineers Canada requires that postsecondary engineering programs to demonstrate how they embed principles of ethics and integrity into curriculum and policy. Having curriculum and policy requirements related to academic integrity in order for programs to maintain their professional accreditation status ensures that schools maintain a constant focus ethical decision-making not only as a core value, but also as part of classroom and administrative practice.

Although this example highlights engineering, the same principles apply to any profession where accreditation bodies play a role in ensuring its members are prepared to undertake a career in the profession. This includes medicine, nursing, social work, education, and many other professions.

In turn, professional bodies can hold employers accountable for the decisions of their employees, managers, and executives. Corporate accountability can be understood through an ethical lens in a variety of contexts.

Professional bodies provide a link between educational programs and the profession. The influence professional bodies have ensuring that integrity and ethics are foundational concepts in educational programs that prepare students to enter the profession cannot be overstated.

## Conclusion

Ethical decision-making is the foundation for academic integrity as much as it is the basis for corporate accountability. Academic integrity extends beyond student conduct in school settings. Connecting academic integrity to workplace ethics and corporate accountability can help students understand why schools have rules and procedures in place to address academic misconduct. Employers and professional associations should be concerned with the ways in which educational institutions uphold and enact academic integrity because schools provide an opportunity for students to learn about and practice ethical decision-making and accountability, skills they can use on a daily basis. Educational institutions, employers, and professional bodies can and

should work together to ensure that ethical decision-making and accountability are infused into the curriculum and into workplace behavior. Ethical conduct and accountability can then be reinforced on a regular basis by employers to ensure it is not only expressed as a corporate value, but also as part of organizational culture, with substantive systems in place to protect integrity and ensure breaches of it are addressed in a transparent and consistent manner.

Students must learn about ethics and accountability long before they enter the workplace. They must learn that their actions – for better or for worse – have consequences. Just as breaches of academic integrity are not a victimless crime, breaches of ethics in the workplace can and do have a long-lasting impact.

## Accounting Ethics (Including the Profession's Code of Ethics and Commitment to the Public Interest)

Andrew West  
School of Accountancy, QUT Business School,  
Queensland University of Technology,  
Brisbane, QLD, Australia

### Synonyms

Accounting profession; Professional ethics; Code of ethics

### Introduction

Traditionally, the distinguishing features of a profession include its ability to self-regulate and maintain its own ethical standards. Given recurring high-profile corporate failures related to accounting misstatements and/or fraudulent reporting, unethical practice by accounting professionals has become an issue of considerable concern, with

significant societal consequences. This entry provides an overview of how the accounting profession addresses ethical issues through the promulgation of its code of ethics, which includes some consideration of the “public interest.”

As of December 2016, the International Federation of Accountants (IFAC) represented close to 3 million professional accountants in over 130 different jurisdictions, through over 175 professional accounting bodies that are members or associates of IFAC (2017). Through several dedicated standards boards, IFAC develops standards for its members covering public sector accounting, auditing and assurance, accounting education, and professional ethics. Addressing the ethical expectations of professional accountants, the *Handbook of the Code of Ethics for Professional Accountants* (the “Code”) is prepared by the International Ethics Standards Board for Accountants (IESBA), which in turn is monitored by the Public Interest Oversight Board. The Code is comprised of three main sections, Part A introduces the Code and describes the fundamental principles, Part B provides guidance for members in public practice, and Part C provides guidance for members in business.

The Preface to the Code stipulates that IFAC member bodies and firms “shall not apply less stringent standards than those stated in this Code” (IFAC 2016, p. 7), while also noting exceptions where laws or regulations may take precedence, and that where some jurisdictions provide differing guidance, the more stringent requirements should be applied.

### The Public Interest

Part A of the Code begins by declaring that “a distinguishing mark of the accountancy profession is its acceptance of the responsibility to act in the public interest” (Para. 100.1). It goes on to explain that a professional accountant does not only have responsibilities to his/her employer or client. This concept of the “public interest” provides a key justification for the fundamental principles and the conceptual framework approach adopted in the Code (discussed further

below), and is central to IFAC, which describes its mission as “to serve the public interest by: supporting the development of high-quality international standards; promoting the adoption and implementation of these standards; building the capacity of professional accountancy organizations; and speaking out on public interest issues” (IFAC 2016, p. i).

Although the Code does not define the “public interest,” exactly what this term means was clarified in a policy position paper issued by IFAC in June 2012, where it is defined as “the net benefits derived for, and procedural rigor employed on behalf of, all society in relation to any action, decision or policy” (IFAC 2012, p. 1). Related to IFAC’s mission, this definition is intended to assist in understanding how IFAC achieves its objectives; however, the position paper acknowledges that this definition is also applicable to the accounting profession itself.

The position paper proceeds to explain what is meant by the terms “public” and “interest.” The word “public” is taken in a broad sense, including investors, shareholders, business owners, employees, consumers, suppliers, taxpayers, electorates, and citizens. While it is clear that the profession will impact each of these groups in different ways, the paper affirms a responsibility to act in the public interest regardless of how close it is to the various stakeholder groups.

The term “interest” is defined broadly as “all things valued by individuals and by society” (IFAC 2012, p. 3), but the paper then clarifies that the interests that the profession contributes to realizing are often economic and relate to the management of resources. In practical terms, this is related to the sound and efficient operation of financial markets, including reporting and governance in both the private and public sectors, as well as the efficient use of natural resources for improved societal welfare.

The position paper goes on to describe two ways in which achievement of the public interest can be assessed. The first involves an evaluation of the costs and benefits of a particular action; the second involves an assessment of process and

identifies “transparency, public accountability, independence, adherence to due process, and participation that includes a wide range of groups within society” (IFAC 2012, p. 4) as relevant factors for consideration. Some potential for conflict and some inevitable “tradeoff” between these two principles are envisaged.

## Fundamental Principles

In addition to the “public interest,” the core concepts of the Code are evident in five fundamental principles that underlie the ethical expectations of professional accountants, regardless of their employment situation or circumstances. Due to their significance, the brief descriptions provided in Paragraph 100.5 are reproduced here:

- (a) Integrity – to be straightforward and honest in all professional and business relationships
- (b) Objectivity – to not allow bias, conflict of interest, or undue influence of others to override professional or business judgments
- (c) Professional competence and due care – to maintain professional knowledge and skill at the level required to ensure that a client or employer receives competent professional service based on current developments in practice, legislation, and techniques and acts diligently and in accordance with applicable technical and professional standards
- (d) Confidentiality – to respect the confidentiality of information acquired as a result of professional and business relationships and, therefore, not disclose any such information to third parties without proper and specific authority, unless there is a legal or professional right or duty to disclose, nor use the information for the personal advantage of the professional accountant or third parties
- (e) Professional behavior – to comply with relevant laws and regulations and avoid any conduct that discredits the profession

The Code provides more detailed descriptions of each of these in later sections within Part A.

## Conceptual Framework

These fundamental principles are then applied through the use of a conceptual framework that consists of three steps (see Para. 100.2). The first involves identifying threats to these fundamental principles in practice, the second involves assessing the significance of these threats, and the third involves implementing safeguards to reduce the threats to an “acceptable level” or eliminate them completely. The use of professional judgment is essential to applying the framework, and if a significant threat is such that it cannot be eliminated or reduced to an acceptable level, professional accountants are expected to withdraw from the activity in question (which could involve resigning from an engagement or employer; see Para. 100.9).

The Code identifies five types of threats which could in various circumstances, either individually or in concert, compromise a professional accountant’s compliance with one or more of the fundamental principles. These include (Para. 100.12) self-interest threats, where an accountant has a conflicting interest (financial or otherwise) that could compromise his/her judgment; self-review threats, where an accountant may be required to pass judgment on work that he/she has already performed; advocacy threats, where an accountant may be involved in promoting the interests of a client or employer; familiarity threats, where an accountant’s judgment may be affected by a relationship; and intimidation threats, where an accountant is subject to pressures that could impair his/her judgment.

If any of these threats are considered to be significant in a particular situation, professional accountants are expected to implement safeguards. These are described as being of two kinds (Para. 100.13), those related to the profession, legislation, or relevant regulations and those related to the work environment. Examples of the former include continuing professional development and corporate governance regulations (Para. 100.14); examples of the latter include an accounting firm’s internal control policies (Para. 200.12) or ethical leadership (Para. 300.14).

## Difference Between Members in Public Practice and Those in Business

A significant distinction is drawn between professional accountants working “in public practice” and those working “in business”. Part B of the Code deals exclusively with the former and is the largest section by far (constituting 109 pages of the Code’s 182 pages). The term “public practice” refers to firms that provide professional services such as audit, tax, and/or consulting services, the most familiar of which are the large accounting firms that offer a range of business advisory services (the “Big Four” includes Deloitte Touche Tohmatsu, PwC, EY, and KPMG). Part C of the Code addresses issues relating to professional accountants working in other areas, including commercial roles outside of professional services, as well as those working in not-for-profit organizations, educational institutions, the public sector, and regulatory or professional organizations.

This distinction is related largely to the provision of audit and assurance services and the need for professional accountants performing such services to maintain independence from the clients they serve. While Part B of the Code does address a variety of issues such as conflicts of interest, professional fees, and the marketing of professional services (all with reference to the fundamental principles and the conceptual framework), the majority of Part B (85 of the 109 pages) addresses independence in audit and assurance engagements. Paragraph 290.6 stipulates two aspects of independence: independence of mind and independence in appearance. The former refers to the ability of a professional accountant to exercise professional judgment without compromise in order to come to a conclusion; the latter refers to the avoidance of situations in which a third party could reasonably perceive such independence of mind to have been compromised. Considerable attention is then paid to articulating various situations in which independence may be compromised (again, with reference to the fundamental principles and following the conceptual framework approach). Examples of these include financial interests, business and familial relationships, long association of senior personnel

with an audit client, and the provision of non-assurance services to an audit client.

Part C of the Code is considerably shorter but adopts the same approach (with reference to fundamental principles and application of the conceptual framework) to various situations that professional accountants in business may be faced with. Examples include conflicts of interest, the preparation and reporting of information, acting with sufficient expertise, and inducements.

### Differences Between Countries and Professional Bodies

Although the IESBA Code is intended to be applicable internationally, and one of the goals of the IESBA is convergence of this Code with standards set nationally (IFAC 2016, p. 1), it is implemented in different ways in different countries and by different professional accounting bodies. Some prominent professional bodies (such as those promoting the “Chartered Accountant” designation in the UK, Australia, New Zealand, South Africa, and India) adopt the IESBA Code with minor modifications (which typically involve changes in terminology and/or additional text) to reflect the local context. The Institute of Chartered Accountants in England and Wales, for example, adds an explanation of what “acting in the public interest” means to Paragraph 100.1. It also adds a fourth section to the Code to address specific issues related to professional accountants performing insolvency work.

In the USA there are more substantial differences between the IESBA Code and that promulgated by the American Institute of Certified Public Accountants (AICPA), although there remain many similarities. For example, the “Principles of Professional Conduct” that are identified in the AICPA Code include integrity, objectivity, and independence (for members in public practice), due care, and scope and nature of services (AICPA 2016). Furthermore, the AICPA Code provides rules and interpretations and requires application of the conceptual framework approach

for only those situations that these rules and interpretations do not explicitly address. The threats envisaged in the AICPA Code include adverse interest threats, advocacy threats, familiarity threats, management participation threats, self-interest threats, self-review threats, and undue influence threats.

In other countries ethical requirements are incorporated through a more formal legal or regulatory process. In France, for example, the Minister of Justice is responsible for prescribing ethical obligations in relation to public audit services, and although the IESBA Code is not itself adopted, Decree number 2005-1412 is considered to be more stringent while also including a “threats and safeguards” framework for some circumstances (see Compagnie Nationale des Commissaires aux Comptes (2009)). Similarly, in Germany, most of the IESBA Code requirements are covered by national rules (see Wirtschaftsprüferkammer (2015)).

The different nature of different professional bodies provides for further variation. The UK-based Chartered Institute of Management Accountants (CIMA) partnered with the AICPA to create the Chartered Global Management Accountant (CGMA) designation. The Code of Ethics applicable to CIMA members and those holding the CGMA designation includes Parts A and B from the IESBA Code and a Part C that is more closely aligned with the AICPA Code (Chartered Institute of Management Accountants 2017). The Institute of Management Accountants (a US-based body with more than 90,000 members across 140 countries (Institute of Management Accountants 2017)) provides a further example where it describes the ethical expectations of its members in a two-page *Statement of Ethical Professional Practice* that outlines standards of competence, confidentiality, integrity, and credibility. As IMA members do not provide assurance services, the extensive guidelines provided in Part B of the IESBA Code are not applicable, and the IMA considers its statement to be consistent with the IESBA Code (Institute of Management Accountants 2014).

In addition to the variation in how the IESBA Code is implemented, there are regulatory differences that impact upon the work of professional accountants, such as corporate governance legislation and recommendations, statutory oversight boards, and whistleblowing protections. The various professional bodies typically also provide support for those encountering ethical conflict (such as through the use of helplines) and impose sanctions for those found to be in breach of the relevant Code.

## Adam Smith's *Theory of Moral Sentiments*

David Coldwell

School of Economic and Business Sciences,  
University of Witwatersrand, Johannesburg,  
South Africa

## Introduction

*The Theory of Moral Sentiments* begins with the following observation which largely sets the tenor of the book. Smith, far from depending on the depersonalized and egocentric “invisible hand” to explain human social and economic action, was fully aware of the more altruistic aspect of human nature in the form sympathy for others:

How selfish soever man may be supposed, there are evidently some principles in his nature, which interest him in the fortunes of others, and render their happiness necessary to him, though he derives nothing from it, except the pleasure of seeing it. Of this kind is pity or compassion, the emotion we feel for the misery of others, when we either see it, or are made to conceive it in a very lively manner. That we often derive sorrow from the sorrows of others, is a matter of fact too obvious to require any instances to prove it; for this sentiment, like all the other original passions of human nature, is by no means confined to the virtuous or the humane, though they perhaps may feel it with the most exquisite sensibility.

However, Smith rejected the idea that humans were able to make moral judgments beyond their own limited sphere of activity and focused on their own self-interest, although socially beneficial outcomes emerged from this. He indicates this in his description of the behavior of the rich manufacturer:

... though the sole end which they propose from the labours of all the thousands, whom they employ, be the gratification of their own vain and insatiable desires, they divide with the poor the produce of all their improvements. They are led by an invisible hand to make nearly the same distribution of the necessaries of life, which would have been made, had the earth been divided into equal portions among all its inhabitants, and thus without intending it, without knowing it, advance the

interest of the society, and afford means to the multiplication of the species.

The Theory of Moral Sentiment consists of six parts.

I will briefly describe the main aspects of each part and then discuss a recent multicultural empirical study that focuses on one particular aspect, with a view to demonstrating the durability and conceptual relevance of Adam Smith's work today.

Central to Adam Smith's (1976) "Theory of Moral Sentiment" is the concept of "sympathy." Smith makes a clear distinction between sympathy and pity: "Pity and compassion are words appropriated to signify our fellow-feeling with the sorrow of others. Sympathy... may now... be made use of to denote our fellow feeling with any passion" (Smith 1976, p. 6). Thus, while pity produces feelings of sorrow, sympathy must be distinguished from pity or sorrow as it involves understanding of a passionate occurrence or event through dispassionate analysis; pity, on the other hand, tends to be more emotive and visceral.

## Of the Propriety of Action

In "Of the propriety of Action," Smith begins by pointing out that however selfish some people appear to be, *all* humans have a propensity for compassion and sympathy. Sympathy involves imagining ourselves to be in the position of a person being observed. We are able to sympathize with those experiencing grief and joy, but when observing an angry outburst or reaction, we are more reticent. Only once we have learnt the reasons for anger and are able to take sides with it are we able to feel sympathy towards its perpetrator. Generally speaking we feel approbation for feelings that agree with our own and disapprobation for those that are in conflict/disagreement with these. Smith points out that since dispassionate observers are not fully aware of the reasons for our observed passions we need to temper them to obtain sympathy by showing the "correct" feelings socially for specific life happenings. For example, parents who showed an absence of

sorrow/grief for the loss of their daughter would not obtain sympathy from an impartial observer, nor would they gain sympathy if they exaggerated their grief beyond what is considered socially appropriate and showed a lack of self-control.

Sympathy is evoked differently for different passions. Passions of the body are difficult to sympathize with because other person's bodily passions cannot be directly experienced (although they can be imagined from prior personal experiences). Similarly passions from habits of the imagination such as love between two people cannot be fully experienced, although it can be imagined from past experiences of being in love for those observers that have experienced this and evoke differential feelings of sympathy depending on personal experiences of its intensity and outcome. Unsocial passions, such as anger, evoke little sympathy until or unless they can be seen as justified by an impartial spectator.

Smith points out that sympathy with joy tends to be of a lesser intensity than sympathy with sorrow and that ambition to succeed in life is derived not so much from the trappings of wealth and fame *per se*, but from the sense of approval society shows towards such achievements. Smith notes also that it is often our tendency to admire uncritically wealth and fame and despise the poor and downtrodden that corrupts moral sentiment.

## Of Merit and Demerit; or of the Objects of Reward and Punishment

Smith (1976, p. 25), in "Of merit and demerit; or of the objects of reward and punishment," writes: "The actions and conduct of mankind can be brought within range of approval/disapproval in two different ways: one is through their being proper or improper, decent or graceless, right or wrong; the other is through their having merit or demerit, the qualities of deserving reward and of deserving punishment." Smith goes on to state (1976, p. 36): "The sentiment that most immediately and directly prompts us to reward someone is gratitude, and what most immediately and directly prompts us to punish someone is resentment."

Smith then goes on to state that a person who appears to deserve reward is the object of our gratitude, while a person who appears to deserve punishment evokes feelings of resentment in us. Sympathy for merit is found when the spectator has direct sympathy for the emotions of the benefactor and indirect sympathy for the gratitude of the beneficiaries. On the other hand sympathy for demerit occurs when there is direct antipathy by the spectator to the sentiments of a criminal and indirect sympathy with the victim's resentment. Punishment must be proportional to the violation of justice. Beneficence is a beautiful thing in itself, like an ornament in a building, while justice is the pillar on which the whole building depends (Smith 1976, p. 47). Smith ends this part of his treatise with the importance of justice in preserving society while recognizing that punishment for a crime is not generally conducted out of a direct concern for the preservation of society, but a concern for the individual. Smith writes (1976, p. 50): "When someone steals money from me, what motivates my prosecution of him is my concern for the particular sum that was stolen. . ."

### **Moral Judgments on Our Lives: the Sense of Duty**

Smith's next discussion concerning moral judgments on ourselves and our sense of duty begins (1976, p. 62) with the assertion that we judge ourselves as we judge the conduct of others.

Thus, "we approve (or disapprove) of our own conduct according to whether, when we adopt the situation of a spectator, viewing our conduct with his eyes (so to speak) and from his standpoint, we feel that we can (or cannot) entirely enter into and sympathize with the sentiments and motives that influenced it." Smith maintains that the way we think others would judge our actions comprises our conscience. Morality and judgment, thus, comes from an interaction of perspectives from the way people see us and our own view of our behavior. Although we are capable of self-deception, our conscience judges our actions by which we aim to be praised and not blamed by society. Although society is capable of wrongly

praising or blaming our actions, our conscience will be able to inform us whether we actually deserve praise or blame. Blame where it is misplaced is regarded as one of the most shameful forms of human behavior by Smith. The strength of our conscience is dependent on our interaction with impartial people. If we only interacted with nonimpartial people, such as members of our families, we would not be able to judge our own behavior objectively. Our conscience learns to control us through experiences of moral situations and dilemmas and derives from these general rules regarding moral behavior. Such general moral rules constitute duty and that this sense of duty that we have internalized was God-given since the moral laws derived from them would help sustain harmony in the universe (God's purpose). Smith points out, however, that duty is not always the only motive for moral action, we can also promote good out of a sense of benefice, which would both amplify and be tempered by our sense of duty. Smith also points out that duty on its own is insufficient and usually loosely defined as general moral rules that need adaptation and focus according to specific contexts.

### **The Effect of Utility on the Sentiment of Approval**

In "The effect of utility on the sentiment of approval," Smith tries to show that utility is not the only factor in making something beautiful in moral or aesthetic terms. Smith (1976, p. 96) writes: "The fitness of any system or machine to produce the end for which it was intended confers a certain rightness and beauty on the whole thing, making it a pleasure to think about—and this is so obvious that nobody has overlooked it". Thus, while Smith acknowledges that utility is an aspect of beauty, there is something more: "But there's another fact about utility and beauty. It is this: An artifact's being skillfully designed so as to be suitable for some purpose is often valued more than is the purpose itself; exact adjustment of the means for attaining some convenience or pleasure is often valued more highly than the convenience or pleasure itself, though they would seem to be

the sole source of the artifact's merit." (Smith 1976, p. 96). Thus, beauty can exist in an object apart from its function or utility. A well-made and beautifully inscribed watch can be valued despite the fact that it may not be entirely accurate in keeping the precise time.

Smith does not think that utility is the foundation of moral approbation and disapprobation. Because morality is different from beauty and that utility is often a consequence of particular moral decisions, not their instigator. The instigator of our moral sentiment is God who put it there for the harmonious functioning of the universe. Smith suggests that if people were to act simply out of utility, we would always be propelled by self-interest. This clearly is not the case since people are able to act altruistically by showing generosity and even sacrificing their lives for others.

### **The Moral Influence of Custom and Fashion**

In "The moral influence of custom and fashion," Smith (1976, p. 105) writes: there are two "other considerable influences on the moral sentiments of mankind; [namely]... custom and fashion—forces that extend their sway over our judgments concerning beauty of every kind."

Smith suggests that like utility, custom and fashion affects aesthetics and, to a lesser extent, morality. Custom is the correlation between two things that regularly occur together which creates a feeling of aesthetic pleasantness such as that found in elements of particular architecture which together create a particular style. If an element of this style is missing, it would be found incongruous and displeasing because of customary expectations. Fashion is generated from the admiration of people of high status. A particular style of clothes become fashionable if and while people of high status adopt it.

Our moral sentiments, which for Smith are largely given, are not as open to fashion and custom as aesthetics, although they can inure us to moral duty if we become accustomed to them, such as when we are exposed to frequent acts of violence and our moral approbation of these,

diminishes. Smith suggests that it is the influence of fashion and custom that generates differences between cultures, with the most extreme forms of custom and fashion, generating the most extreme forms of "moral" sentiment.

Having indicated that custom and fashion have a lesser effect on moral sentiment, Smith suggests that they do have a greater effect on moral approbation than on disapprobation where there is a greater universal consensus of propriety cross-culturally. At the moral disapprobation extreme, Smith states that general "absolute" moral consensus overrides custom: "But the characters and conduct of a Nero, are what no custom will ever reconcile us to, what no fashion will ever render agreeable..." However, at the approbation continuum extreme, custom or cultural differences have a much more pronounced impact on moral sentiment consensus. For example, although beauty is a concept of approbation that is widely held, nuanced differences are evident in the way beauty is perceived in different cultures and historical periods.

### **Of the Character of Virtue**

Smith (1976, p. 112) begins, "Of the character of virtue" with a definition of prudence which is his core concept of virtue. "The care of the health, the fortune, and the rank and reputation of the individual—these being the items on which his comfort and happiness in this life are supposed principally to depend—is regarded as the proper business of the virtue commonly called 'prudence'".

Because we suffer more when we fall from a better to a worse situation than is our enjoyment when we rise from a worse to a better position, Smith contends that the first and principal object of prudence is security. Prudence avoids risk and dictates our actions to avoid losing our virtue in the eyes of others. Smith lists a number of ways a prudent man interacts socially. The prudent man is sincere, friendly, inoffensive and frugal. As Smith (1976, p. 113) puts it: "The prudent man...[sacrifices],,, the ease and enjoyment of the present moment for the probable expectation of greater

ease and enjoyment later on and for a longer time; and in this conduct he is always supported and rewarded by the complete approval of the impartial spectator, and of that spectator's representative, the man within the breast."

With respect to the happiness of others, Smith (1976, p. 115) suggests that "any individual can affect the happiness of other people only through its disposition either to harm them or to benefit them. The only motive that the impartial spectator can justify for our harming or in any way disturbing the happiness of our neighbour is proper resentment for injustice attempted or actually committed. To harm someone from any other motive should be restrained or punished by force."

Smith concludes this discussion with the view that a person who follows the rules of prudence will be perfectly virtuous: "A man who acts according to the rules of perfect prudence, strict justice, and proper benevolence may be said to be perfectly virtuous. But his own passions play a role in this, and they are apt to mislead him,,,. The most perfect knowledge won't always enable him to do his duty if it isn't supported by the most perfect self-control" (1976, p. 126).

Thus, self-control is the means to virtue. This means controlling our passions and vanities while maintaining appropriate levels of proper indignation.

## Of Systems of Moral Philosophy

In, "Of Systems of Moral Philosophy," Smith considers some historical theories of morality to evaluate and compare with his own of virtue.

Among the ancients, Smith discusses Plato, Aristotle, the Stoics and Epicurus. As well, Smith considers and rejects the lesser known moral theories of his contemporaries and regards them as inadequate because they assume that man has the capacity for perfect virtue through a belief in God. Smith points out human beings are imperfect and therefore need social motives to be virtuous. Smith rejects Mandeville's contention that all "moral" actions are driven by vain self-interest

and consequently not virtuous. Smith maintains that even when people act out of self-interest in acting morally it is not vain but admirable. This is of central importance in understanding how Smith's notion of self-interest, which takes a central part in his major theoretical construct in *The Wealth of Nations* (Smith 2007) is not regarded as morally bankrupt. For Smith, man is capable of acts of genuine altruism and benevolence aside from, or in spite of, his strong natural motive of self-interest.

Smith rejects a Hobbesian worldview because of his assertion that man has a capacity to think beyond himself by imagining himself in the position of others and sympathizing with them.

Smith then considers a theory that suggests that we understand virtue through the application of reason and a further theory that it comes from a specific perceptual facility. In the former case, Smith suggests that our virtue does not derive from reason alone because we have an instinctive moral sense found in our consciences which provides a means for forming general rules of duty. In the latter case, Smith queries that if there was indeed this perceptual facility for virtue, why is it sensitive to context and does not have an invariant quality? Smith ends by discussing practical rules of morality that can be obtained by the application of his theory. This combines the hard rules of justice and the looser rules derived from our moral sentiment.

## The Relevance of the Theory of Moral Sentiment Today

Adam Smith reveals in his *Theory of Moral Sentiment* the Scottish characteristic of prudence (being "canny"), while displaying male chauvinism, religiousness, arrogance, and bourgeois moral orientation that may seem archaic and irrelevant in today's secular and globalized conscientiousness. However, although written in eighteenth century Scotland, Adam Smith's conceptual richness and practical relevance remains perennially useful. For example, Szmigin and Rutherford (2013) regard the *Theory of Moral*

Sentiment and, in particular, Smith's concept of "sympathy" and notion of "impartial spectator" as analytically useful today. They introduce a heuristic "Impartial Spectator Test," "which... [they]... argue, builds on traditional stakeholder perspectives and... provides an objective route to ethical criteria of demarcation" (Szmigin and Rutherford 2013, p. 71).

Coldwell (2015) also presents a recent example of an empirical application of Adam Smith's *Theory of Moral Sentiment*. Coldwell (2015) indicates that Smith (1976) maintains that there are "natural" rights and wrongs in moral sentiment that can be amplified or deadened through their consistency with nature and human society's survival. Behind custom differences in moral sentiment, there are general "natural" human ideas of right and wrong. Smith (1976) maintains that custom and fashion influence moral sympathy, but also recognizes that at the extreme ends of an imaginary moral disapprobation–approbation continuum, there exists a moral consensus in absolute rights and wrongs. "Custom" appears similar in meaning to "culture," but they have clear differences in orientation; "custom" refers to practices and tradition and "culture" ideas and beliefs (Merriam-Webster 2014). Culture and custom are used interchangeably in Coldwell's (2015) empirical study. At the moral disapprobation extreme of the continuum, Smith (1976, p. 15–16) suggests general absolute moral consensus overrides custom factors: "But the characters and conduct of a Nero, or a Claudius, are what no custom will ever reconcile us to, what no fashion will ever render agreeable..." On the other hand, at the approbation continuum extreme, custom has a much more pronounced impact on general sentiment consensus. For example, although beauty is a concept of approbation that has some widely held basic and fundamental consensus in general human appreciation; nuanced differences are evident in the way it is perceived by different cultures and in different historical periods. This aspect is emphasized too by Smith. Smith's argument is shown diagrammatically in Fig. 1.

Figure 1 indicates that at high levels of moral sentiment consensus of absolutes (i.e., *natural*

**Adam Smith's *Theory of Moral Sentiments*, Fig. 1** A diagrammatic heuristic model of Adam Smith's "Theory of Custom and Moral Sentiment"

senses of right and wrong) in moral approbation and disapprobation of conduct, the influence of custom tends to be low. Here moral approbation (approval) and disapprobation (disapproval) remain relatively unaffected by custom. However, custom does affect sentiments of moral approval and disapproval where moral absolutes tend to be less complete and, as Smith (1976) suggests, this tends to be the case more for approval than disapproval of specific moral conduct. In Fig. 1, this is shown in the steeper curve (A, B) for moral disapprobation than approbation. This phenomenon is clearly illustrated in Smith's (1976) examples of Nero and Claudius where a high general moral disapprobation towards the absolute wrongness of their conduct is evident. However, Smith's further example of infanticide also emphasizes this absolute moral disapprobation aspect further (at E of line A B). The absolute disapprobation of infanticide is underlined by its *natural* wrongness in that, if widely adopted, human society would cease to exist altogether. Conversely, the diagram indicates that at lower levels of moral disapprobation the effect of custom would be likely to increase. For example, take the current debate concerning marijuana. Is marijuana a drug that tends to undermine society by creating an underclass of addicts that deserves moral and legal censure Or is it a drug that should be freely available to alleviating physical and mental suffering? In line with Adam

Smith's contention, much of the moral discussion around marijuana usage today is influenced by custom and culture as it lacks the natural absolute right or wrong characteristics that Smith's (1976) theory describes. It lacks absolute moral consensus as a *natural* wrong as it does not pose an absolute destructive property to human survival.

On the other hand, custom is more important in moral approbation as good conduct, like beauty, which has no clear absolutes, although Smith (1976, p. 16–17) recognizes that may exist even with a concept like “beauty” at very high level of abstraction. “I cannot admit that custom is the sole principle of beauty, yet I can so far allow the truth of this ingenious system as to grant, that there is scarce any one external form to please, if quite contrary to custom . . .”

Smith (1976) makes it clear how particular professions give specific rigorous codes on acceptable moral conduct. Szmigin and Rutherford (2013) maintain that the impartial spectator concept affords a mechanism for freeing ourselves from bias by providing “. . . an explanatory mechanism of moral judgement based on common sense and enabling a disinterested and dispassionate evaluation of the motives and actions of ourselves and others. It does this through foresight to compare one situation in the context of others and in terms of moral rules and what society should approve” (Werhane 1991, p. 38). This quotation both acknowledges the propensity for cultural bases regarding moral rules and affirming that the judgment of moral conduct should, as far as possible, be that of an impartial spectator who weighs up moral conduct “averages” in terms of specific existing societal customs.

To achieve this end, Coldwell's (2015) qualitative empirical study used German and South African postgraduate students who were under training for particular Management professions and relatively free of professional biases, but who were nevertheless, immersed in the different cultural customs of their respective backgrounds. The study empirically analyzed Smith's theory using the heuristic devise described earlier, by investigating German and South African student moral sentiments towards specific ethical leadership behaviors. The study found, in basic

agreement with Adam Smith's theory, that while there was general cross-cultural homogeneity in moral approbation for fundamental aspects of ethical leadership behavior, nuanced custom-based differences emerge from the qualitative analysis. Thus, although ethicality of specific leadership behavior was found to be viewed similarly by both groups of students, significant nuanced differences arose among the German students who emphasized the moral autonomy of the leader in making ethical decisions rather than the “collective concern” moral orientation favored by their South African counterparts. Both these recent studies bear testimony to the continued relevance and utility of Adam Smith's classical work.

## Synonyms

Marketing and advertising; The body

## Introduction

How skin, as a key visual, tactile, and communicative feature of the body, *appears* matters in consumer culture. Indeed, skin appears to speak to who we are. Skin touching skin often implies aspects of human relationships. Skin contains and shares our humanity. Not surprisingly, then, skin in consumer culture imagery offers a powerful canvas on which to paint persuasive portraits of self, identity, and otherness. The human body – a basic, and ancient, representative form – and its distinguishing elements, such as skin, function as potent strategic signifiers for a vast array of products, services, and ideas in consumer culture imagery, as well as in wider discourses.

Skin serves consumers as a signal of desire, an ontological marker of difference, and a strategic marketing tool for brands. Typified by the marketing of cosmetics, “anti-aging” products, Botox, cosmetic surgery, and skin lightening, consumer culture surveils skin and body, seeking flaws and imperfections that need to be “corrected” by consumer procedures (Bartky 1990). A primary claim of this entry is that consumer culture imagery in strategic communications mobilizes skin to resonate and communicate with consumers, which impacts the meaning making possibilities of skin more broadly. For instance, skin provides an example of what is called “strategic fit” in advertising where “fit” refers to organizations harnessing the potential of various types of imagery to create positive identities for their brands. In other words, skin is called upon to do things.

Images of skin matter in this context because images inform what people believe, who they become, and how they understand others. We focus on concepts of fetishization and the epidermal schema as key drivers that are strategically implemented in processes of skin commodification. Fetishization and the epidermal schema materialize via photographic techniques that include close cropping, flash, and the creation of effects such as surface textures of smoothness and shininess. Furthermore, fetishization and the epidermal schema work to make skin “scalable”; in other words, represented skin offers meaning

along a value-laden continuum – evoking, for example, status in relation to class and racial designation. Smooth or rough, light or dark, moist or dry: skin meanings alter and offer value for target marketing and branded identities (Borgerson and Schroeder 2018, 2021).

## Reading Skin in Consumer Culture

The impulse to read skin encourages recognition of differences, of hierarchies, and other clues to meaning in strategic communications. In this sense, the skin plays an active role in the expression, development, and communication of self, particularly given an understanding in which the self is intersubjective, co-constituted in contact with others, and always already embodied. Indeed, when looking at images of the body in consumer culture, including representations of skin, consumers are invited – and expected – to compare, contrast, and judge (e.g., Bonsu 2009; Johnson and Grier 2012).

Notions of consumption, materiality, and identity inform understandings of the relation between skin and self in consumer culture: consumers gaze upon and engage with images and representations of skin that denote similarity with, or difference from, themselves, for example, in relation to race, gender, class, and age. In this way, consumer cultures offer up a plenitude of symbolic resources that often rely upon dualisms wherein visions of the feminine, the black, the poor, and the exotic stand in opposition to the masculine, the white, the privileged, and the “normal.” In other words, consumer products and experiences, as well as consumer culture imagery in marketing communications and branding campaigns, provide semiotic material, including skin, to be worked on and incorporated by consumers in the construction of their identities and related self-narratives.

Not surprisingly, images in consumer culture reflect widely circulating notions of skin color, race, and identity. Everyday photographic images that show skin embody epistemological, ontological, and ethical notions regarding the relationship between skin and ideals of age, class, gender, and

race, as well as attractiveness, health, and sexuality. Indeed, photography offers a rich history of presenting the body and remains an essential tool of contemporary marketing campaigns. Many leading Internet companies, such as Facebook, Instagram, Pinterest, TikTok, Tinder, and YouTube, depend upon photography for their core business model – in the form of uploaded, posted, sent, and commented upon photographs and videos of people that provide the basic content and look of much of their brand (Schroeder 2002).

The visual technologies that produce contemporary representations of skin have expanded and transformed under the gaze of social media, with its incessant demand for images of the body. Innovations in the visualization of skin emerging from artificial intelligence and digital technologies – high-definition broadcasting, image manipulation software such as Photoshop, and increasingly sophisticated facial recognition algorithms – combined with the pervasive circulation of images, have generated significant implications for the commodification of skin in consumer culture and skin's relationship to identity.

In contemporary consumer culture, racial categories and their assumed connections to skin color are persistently represented in a process of iteration (Borgerson and Schroeder 2008; Schroeder and Borgerson 2005). Many images juxtapose racially coded skin – black and white and in-between – in a way that emphasizes perceiving racial identity based on a readable “scale” of skin tone. Such apparent difference may appear in advertising images designed to address a variety of consumers, for example, by showing a “selection” of racially coded models to demonstrate that a facial cream is suitable for “everyone.”

Historically, as the market for photography expanded, and concern for representational ethics developed, criticism arose about film's seemingly neutral depiction of skin tone, addressing the reality that “until about the mid-1960s, it was probably assumed by most users that visual media were designed to ‘naturally’ reproduce all skin tones

equally well” (Roth 2009, 117). In fact, the technical and filmic representation of skin often starts from a base of “whiteness” or “Caucasian” skin – mimicking and supporting epistemically closed notions of what we and others call the “epidermal schema.”

Skin, then, forms the basis of analysis for a number of crucial inquiries. Further, skin in consumer culture imagery, such as branding campaigns and marketing communication, provides a relatively unexplored site of such inquiry. In the next two sections, on the epidermal schema and the fetish, we develop some concepts to deepen and expand analysis of body and skin imagery. The epidermal schema and the fetish underlie processes of commodification and shape how representations of skin function within consumer culture, often to reinforce sedimented notions of identity.

## The Epidermal Schema

The commodification of skin has drawn upon a host of racist practices. In this section, we mobilize revolutionary psychiatrist and philosopher Frantz Fanon's conception of the *epidermal schema* to explicate the various ways that skin “appears” in consumer culture imagery. The epidermal schema works to reduce human being and identity to skin, to focus attention on differences in skin color, to emphasize ontological distinctions signaled by differences in skin color, and to valorize whiteness (Fanon 1967). We draw upon Fanon's critical race theory, not because we are interested only in racially charged skin in representation, but because concepts such as the epidermal schema shed light on a host of intersecting concerns of identity, such as gender and class (e.g., Thomas 2013).

Black skin – in semiotic terms – often connotes exoticized identity and a sexualized fascination with the other. Blackness, far from a blank landscape, has philosophical status. Blackness, particularly in racist contexts, carries basic ontological and epistemological assumptions, for example,

who certain people are and what is known about them – and thus entails racist forms of ontological and epistemological closures. Skin “color,” in this sense, becomes being and definitive essence.

Racist notions of identity that revolve around the epidermal schema underlie the discourse of *miscegenation* – the mixing of races by “interracial” dating, “intermarriage” and “interbreeding.” Laws against miscegenation persisted in the United States up until the 1970s, and strictures about miscegenation linger on throughout the world. Racist objections to miscegenation center on ideas about racial “purity” and the “unnatural” prospect of one race breeding, or even “mingling” with another. The “mixing” that occurs at the level of the epidermal schema suggests that skin color and skin tone serve as “evidence” of miscegenation. Racism avows that such miscegenation should not occur, and these beliefs form a fundamental aspect of racist attitudes. In turn, critical argument and response to these attitudes and systemic formations create a foundational element of critical race theory.

Rules about miscegenation place simple-minded conceptions of race at the heart of identity. From this perspective, different races represent different ontologies: they are different “things.” Understanding the racist basis of miscegenation statutes may shed light on contemporary discourses on the “mixing” of evolving human forms, such as the cyborg, as well as surgically, technologically, or digitally transformed beings. Related discussions encompass the cyborgian “mixing” of human skin and machine skin, as well as transgender “mixing” of “female skin” and “male skin.”

Lightness and darkness of skin continue to place “racial mixing” on the epidermal schema’s scale of value and meaning. Strategic communications and promotional imagery draw upon these underlying understandings to communicate and resonate with targeted consumers. The epidermal schema and notions of miscegenation, as well as digital miscegenation, provide a frame for perceiving a context of commodified skin in consumer culture imagery. In the following section, *the fetish* complements and deepens our analysis, emphasizing decontextualization, displacement,

and disavowal, as consumption objects and processes promise gratification but fail to deliver, often disrupting human relations.

## Fetishization

For postcolonial theorist Homi Bhabha, skin color represents “the most visible of the fetishes” (1983). Fetish, as used here, includes this understanding, but also refers to a broader cultural process of fetishizing objects via communicative technologies. The fetish is often associated with *commodification* – associating objects and humans with markets and mass consumption. For example, marketing communication encourages consumers to worship brands for their ability to complete the self, to help in achieving satisfaction – or even ecstasy – and to revere brands for their capacity to project desired images. In this way, consumer goods function similarly (in a psychoanalytic sense) to the fetish object, which promises gratification but which is ultimately unable to deliver, forever displaced within a fetishized relationship (Schroeder and Borgerson 2003).

Fetishized objects often symbolize control and release, power and helplessness, sexuality and immaturity. In psychoanalytic terms, a fetish may be a dysfunctional response to sexuality, eventually replacing human contact for erotic arousal. Further, a fetish relationship, in some cases, interferes with the ability to have more “human” relations. Typically linked to sexuality, fetish items are often contextually isolated – the leather boot that by itself arouses, the disembodied body part, or fishnet stockings unconnected to any recognizable body (Schroeder 2002). Visual communication often further displaces these objects via a similar process of representational fetishization, by which an image replaces the physical object.

Fetishization – the process of turning something into a fetish object – constitutes an important tool of promotional communication. A basic branding strategy involves imbuing consumer goods with fetish-like power. Moreover, contemporary consumer culture teems with overt representations of iconic fetish objects, such as high-heeled shoes and leather corsets.

Two factors underlie the visual power of fetish: 1) associations made through repeated usage of stock “fetish” items in fashion, photography, and pornography, and 2) what has been called the *liminal* element of representational fetishization (Schroeder and Borgerson 2003). The term liminal reflects a gap, a space between, or an edge. Liminal zones often define spaces of uncertainty, creativity, danger, and passion. The space between – a space to be entered or crossed – can be simultaneously exciting and unnerving. Skin is liminal in the way it exists between the inner body and the outside realm, forming a boundary between oneself and the world. Touching someone’s skin often indicates entering a liminal zone – signaling attraction, care, control, intimacy, sexuality, thoughtlessness, or threat, depending upon the context.

Fetishized and mediated skin crosses liminal zones and embodies attraction and taboo, adding value to brands, products, and services in an economy fueled by obtaining consumer attention. Representational fetishization in consumer culture contributes to a larger project of linking consumption with emotional satisfaction, physical gratification, and psychological fulfillment. The fetish relationship – object worship, delusional belief in the power of the fetish, and substituting human relations with fetish relations – influences the broader dimensions of consumer culture and its fascination with alluring objects, including objectified skin.

### Visual Technologies of “Skin Security”

The turn to the realm of consumer culture imagery demonstrates how commodified skin propagates, circulates, and maintains an ideology of skin informed by racist conceptions of the epidermal schema, supported by fetishization and epistemic closure. “Skin Security,” a long-running promotional campaign from global cosmetic company Shiseido, reveals a standard trope for “beauty” brands – showing models with varying skin tones, seemingly representative of different ethnic types, to demonstrate the brand’s appropriateness

for all consumers. Generally, these images feature a white model, a black model (often light-skinned), and either an Asian or Hispanic model. In one example, by invoking fetishized skin and the epidermal schema, three models appear to stand in for their respective racial identities (see Caldwell 2016).

Commodified skin designates identity through epistemic closure fueled by anonymity and typicality, wherein anyone of a kind stands in for anyone else of that type (Borgerson and Schroeder 2002). The Shiseido ad remains primarily focused on skin, but potentially racially associated features of each model are visible, including their hair, eye color, and facial structure. The ad provides no other information about these people, simply the skillfully produced photograph, with its emphasis on their skin tones and unblemished appearance that “radiates with healthy looking skin.” Furthermore, intersectional issues concatenate: class – the unabraded, undamaged “quality” of skin signals affluence; gender – these models epitomize feminine ideals; sexuality – skin that adheres to norms of maleness and femaleness often marks a prerequisite for attractiveness and heterosexuality; and youth – their smooth skin shows no marks of age.

Photography supports fetish relationships by stripping people and products of context and visually emphasizing tactile qualities, such as smoothness. When used in promotional imagery, photographic techniques such as close cropping, dramatic lighting, shallow focus, and digital manipulation, abstract and decontextualize skin. Photographic film was developed with “white” skin tones as the basis for accurate color reproduction, and attempts to capture other skin tones lagged behind, which profoundly influenced the photographic representation of identity. Moreover, the language of photography echoes the vocabulary of skin color: the use of “black and white” to describe film and photographs that actually depend upon millions of tones between “pure” black and “pure” white reinforces a dichotomous conception of black and white. This terminology inscribes racial categories with

technological markers in a process of racial fetishization. In other words, the ontological fixedness of skin is regularly relied upon to function visually; and arguably these iterations reinforce racist perceptions of difference and distinction.

## Ethical Foundations for Skin Inquiries in Consumer Culture

If fetishization, epistemic closure, and the epidermal schema constitute the interpretative frame and meaning-making processes for understanding representations of skin, then skin in strategic communications and promotional imagery should be recognized as important territory for ethical concern. Commodified skin, far from a simple neutral surface, or “white space,” performs particular and often ethically contentious meaning creation roles in consumer culture, forging and iterating sedimented relations. That is to say, consumer culture images of commodified skin contribute to the formation of identities of consumers, as well as to the identity attributions consumers may make based on the skin upon which they gaze.

In other words, contemporary, everyday images provide fertile ground for assessing how consumer culture invokes, interrogates, and inflames ontological tensions and charged cultural issues, including normative ideas about the body, gender, race, and identity. By focusing on consumer culture imagery to analyze the commodification of skin, we expand the domain in which ethical issues of commodification, representation, and skin can be understood.

## Advertising Ethics

Andrew B. Gustafson  
Creighton University, Omaha, NE, USA

### Synonyms

Ethical product promotion; Moral advertising

### Introduction

This is a study and concern about how one ought and ought not to promote products, services, and ideas through various sorts of media. Issues include not only the truth in advertising but the appropriate methods of persuasion as well as concern for potential harms caused, the undermining of autonomy, or other negative effects of advertising on society.

What is advertising? *Advertere* in Latin literally is *ad* (“toward”) and *vertere* (“to turn”), and the point of advertising is to get potential customers to *turn toward* a product, service, or idea. Advertising has a positive role in society by alerting people with common interests to products or services which they really want and need. As Leiser has written, “Advertising is far more ancient, and in some respects more respectable, than many people imagine. In a sense, the first person to cut open a fruit or vegetable so that passersby could see its interior before buying it was engaged in advertising.” So advertising is originally the act of trying to alert people to products, services, or ideas. The ethics of advertising then is the study of what are ethical or unethical means of trying to alert people to these things. Ethical considerations include the beneficial effects to society and the common good (utilitarianism), effects on personal moral character and well-being (virtue ethics), and proper rules which promote dignity of all human beings and fair treatment of all (Kant, Rawls).

Early advertisements came to the public through billboards, newspapers, magazines, and cinemas, then radio, and eventually television as

well, and now the vast majority of advertising spending goes toward Internet ads. While Internet advertising has some unique aspects, there are a number of basic ethical concerns which arise in the field of advertising. Here we will consider some of the general categories of criticism which are often brought up against advertising, and then we will examine some of the specific issues which advertisers should consider when developing an ethical approach to advertising.

### General Critiques

Advertising can have powerful effects on consumers and society. Of course there are positive benefits, like learning about products which will really solve a problem or fulfill a need, but there are also negative aspects from advertising which critics highlight. Criticisms that advertisements or advertisement campaigns are unethical usually are rooted in one of the following sorts of critiques.

1. Deception and False Advertising: It is not uncommon for ads to promise one thing and deliver another – bait and switch. Pictures of the hamburger look much better than the real thing; photo manipulation, air brushing, and exaggeration are common features of advertising. However, if it is widely known that advertising tends to exaggerate and idealize, and people aren’t expecting the whole truth from an ad, then the question of truth-telling is not so simple. Advertising makes promises to us, which it frequently cannot keep, and we know that. If I buy her this ring, we’ll have true love; if I go to this restaurant, I will have an amazing evening; or if I buy these shoes, I will be a real champion! Levitt (1970) points out, “We in effect expect and demand that advertising create these symbols for us to show us what life might be, to bring the possibilities that we cannot see before our eyes and screen out the stark reality in which we must live.” In fact, it may be that we want advertising to lie to us, if only to give us false hope. Nevertheless, outright fraud in advertising is clearly wrong. But what’s lying.

2. **Autonomy Critiques:** A fundamental assumption of advertising is that the consumer is sovereign, and advertisers cannot “make someone” purchase a product – the consumer has control over their decisions, and so it is on the consumer to be alert and aware of advertising’s persuasive tactics. The phrase “buyer-beware” captures this assumption. If the quart-sized soda costs 1.25, but the quart-sized soda which is sold in a different cup which says “JUMBO” on it sells for \$1.50, it is up to the consumer to be smart enough to see that the cup that doesn’t say “JUMBO” on it is the better deal.

But some think autonomy can be compromised through advertising, and it is frequently claimed that marketing and advertising undermine free will and autonomy of consumers. Yes, advertising can be beneficial in alerting us to useful information, thereby empowering us and helping us to find solutions to our problems and satisfaction for our desires, but some have argued that advertisements can have the effect of actually creating or prompting desires in us, directing us toward one thing rather than another, at times preying on or even developing a weak will in consumers and sometimes even causing frustration as it presents desires we cannot fulfill. John Kenneth Galbraith coined a term called the dependence effect – that the needs we have are frequently created by business advertising. Production only fills a void that it has itself created, wants and desires are now directed by production, and “as society becomes increasingly affluent, wants are increasingly created by the process by which they are satisfied” (Galbraith). If advertisements have such an effect on us and our autonomy – directing our desires and goals – then it seems that advertisers have a significant social responsibility in what they do through advertisements, i.e., advertisers have responsibility for how they try to persuade our desires and focus our attention (Gustafson).

3. **Harm Critiques:** When people consider advertisements for cigarettes, alcohol, strip clubs, casinos, or other “sin products,” they

frequently see the advertisements as harming consumers, insofar as the ads are meant to prompt affections for these sin products. Others will criticize advertisers for making us more and more materialistic – encouraging us to find fulfillment in material goods which the ads want us to purchase rather than family, relationship, and community or other non-market activities. In this way, advertisements distract us from the common good of society and make us more selfish. But others like Levitt (above) see advertising as providing us helpful distractions in an otherwise meaningless and drab life. Zygmunt Bauman has in fact said that the consumerism which we practice relieves our existential anxiety and has become our identity (Bauman). Beyond the harm to consumers, Waide has argued that advertising harms consumers because we buy more and enjoy it less, and we begin to believe that we are what we own. Waide goes even further and argues that advertising may in fact make advertisers themselves worse persons, as they treat potential customers as a means to their end (a sale): “In general, influencing people without concern for their well-being is likely to reduce one’s sensitivity to the moral motive of concern for the well-being of others. Compassion, concern and sympathy for others, it seems to me, are clearly central to moral virtue. Associative advertising must surely undermine this sensitivity in much of the advertising industry. It is, therefore, *prima facie* morally objectionable” (Waide).

4. **The permeation, colonization, and transformation of the world by advertisements.**

Advertisements are all around us. The average person in 2007 encountered around 3500 ads per day, but today the typical person encounters between 4000 and 10,000 advertisements per day, due in large part to online advertising. Ads are everywhere in our daily lives – not only on billboards, bus stops, magazines, and vehicles but on our clothing, in our schools, on our computers, and on our phones – advertising is literally with us everywhere. It has colonized all spaces (even restrooms). In this sense, corporate advertising

has seeped into our concepts and ways of thinking about the world (Klein 2000). Some also point out that advertising-inspired consumerism is destroying the planet: some critics, like Sut Jhally, argue that advertising is actually responsible for the destruction of the world itself as we are encouraged to use far more resources than is reasonably sustainable, and so advertising is bringing us to an apocalyptic end. He states, “20<sup>th</sup> century advertising is the most powerful and sustained system of propaganda in human history and its cumulative cultural effects, unless quickly checked, will be responsible for destroying the world as we know it. . . Simply stated, our survival as a species is dependent upon minimizing the threat from advertising and the commercial culture that has spawned it” (Jhally 2017).

### Specific Issues in Advertising Ethics

- A. **Marketing to Children:** There is a large literature on advertising and marketing to children, due to the fact that children do not have the full rational capabilities which are frequently assumed in the phrase “buyer beware” – the buyer is assumed to be a fully rational autonomous human, not a child who perhaps cannot tell fact from fiction and who is without the rational abilities to “resist” advertisements with reason. There are also advertisements to kids in schools, even in their textbooks or in corporate-sponsored media. There are three basic ethical principles to consider in marketing to children:
  1. **Veracity:** since children have a more difficult time telling reality from fantasy, it is easier to deceive them about the truth.
  2. **Fairness and respect:** corporations have the unfair advantage of sophisticated powerful firms up against naive powerless kids.
  3. **Harm to children:** there is harm done to children by advertising, such as nurturing a desire for candy or unhealthy fast food.
- B. **Targeting the Poor:** Advertising is not limited to the affluent, and one criticism frequently raised by critics is that it frequently targets the poor with services or products which are appealing to their vulnerabilities which do not have their best interests in mind. Billboards which promote malt liquor – a cheaper alcohol product which will get you drunk for less – are seldom found in affluent neighborhoods and are much more likely to be found in neighborhoods with a high population of homeless alcoholics. One also will frequently find check cashing shops which charge exorbitant rates of interest and rent-to-own stores which typically end up charging three to four times as much for their products once the finance charges are added.
 

There are however arguments that companies like Fingerhut, and check cashing operations, which do aim to provide credit to consumers who otherwise cannot get it, do provide a needed service which helps people who have nowhere else to turn. Some have even argued that bringing the “bottom-of-the-pyramid” poor into the market as consumers actually can help them through the efforts of Grameen Bank and other such ventures.
- C. **Targeting Women (or Men):** There have been many criticisms of the false realities and unrealistic ideals and expectations which have been promoted through airbrushed models aimed at women. These ideals frequently promoted through advertising have been shown to lead to eating disorders and other negative self-image issues for women. Men are also targeted and are made to feel that they will be a lesser man unless they have hair implants or get treated for ED or get the latest muscle-building exercise machine.
- D. **Targeting the Elderly:** The elderly are frequently portrayed in a bad light in many advertisements – as senile, confused, unhip, and out of touch. But many advertisements which are directed at the elderly such as insurance, retirement, or pharmaceutical ads aim at their insecurities and sometimes lack of technological understanding.
- E. **Institutional Racism in Advertisements:** Advertisements help establish and perpetuate norms of a society – what is normal and what is expected. In this way, they reify stereotypes we may already have. While advertising is rarely overtly or intentionally racist, it can at times perpetuate somewhat racist ideas through who

it includes or doesn't include in its advertisements. An advertisement for investment advice might not say that black people are not welcome, but it might only picture apparently wealthy upper-class white people as clients in its advertisements, for example.

- F. **Stealth Marketing:** Consumers frequently don't even realize that they are receiving advertisements, such as product placements in films: companies pay a certain fee to have their product mentioned, a higher fee to have it shown, and an even higher fee to have it used in the film. This has happened in James Bond films and many others (Sut Jhally, Advertising and the End of the World).
- G. **Associate Advertising and Its Effects:** The ideas, values, pursuits, and images which advertising presents to us permeate our lives more than we probably realize. As Schudson (1986) writes, "Advertising, whether or not it sells cars or chocolate, surrounds us and enters into us, so that when we speak we may speak in or with reference to the language of advertising and when we see we may see through schemata that advertising has made salient for us."

Waide describes a practice in advertising called associative advertising, where the strategy to increase sales is the advertiser identifies a deep-seated nonmarket good with their product, despite the fact that the market product often has little direct relationship to the nonmarket good. Advertisements attempt to associate the purchase of a body spray, or a breath freshener, or a diamond with sex or love. They try to associate the purchase of a wine or soda pop or snack chip with friendship and community. Waide sees associative advertising as bad for advertisers, insofar as they harm their own character (desensitize/lose sympathy) as they become intent on manipulating desires and beliefs of others and also as bad for consumers insofar as we buy more and enjoy it less and we begin to believe that we are what we own. He states, "Associative advertising must surely undermine this sensitivity in much of the advertising industry. It is, therefore, *prima facie* morally objectionable (Waide 1987)."

But not all see associative advertising as such a bad thing. Arrington, for example, says critics of associative advertising give us nonautonomous desires, create irrational desires and confuse our preferences, produce compulsive behaviors, and overall control consumer behavior. But Arrington rejects

these criticisms pointing out that ultimately people have free will and they aren't stupid, and some of the promises of advertising are actually fulfilled. Frequently our lives become more meaningful through advertisements' hopes and promises, and associative advertising is such an integral part of our economy and society (Levitt 1970), and we basically can't disentangle our concepts of products from our collective conscience because advertising is essential to our culture.

- H. **Big Data Analytics and Advertising:** Now that companies can track customers' desires and target specific ads to them based on their web searches and interests, there are new and increased ethics concerns for advertisers to consider. Privacy of the consumer's data and identity, which are now commonly tracked and mined to discover consumer habits, is one source of ethical concern. The confidentiality of such data, and transparency to allow consumers to understand that and how their data is being used, is important. Big data analytics can lead to feedback loops which might undermine and erode free will, and it can institutionalize unfair biases like racism or sexism.

## Conclusion

So there are many potential ethical criticisms of advertising. Advertising has a great deal of power in society, and with that power and ability to influence comes a great deal of responsibility. Advertising cannot, on the one hand, be a multibillion-dollar industry which makes money on the promise that their advertisements do make a difference and, on the other hand, claim that ultimately they have no power to persuade and so no responsibility. That said it is important to remember Leiser's reminder of the very positive function which advertising can play in society:

Advertising has a "useful function to fulfill in a free society . . . Truthful advertising can help bring people with common interests together so that they can achieve ends that they could not reach without one another. It is an important instrument that can encourage free trade and competition and be a powerful force for good in society." (Leiser 1978, *The Ethics of Advertising*, 174–175)

## Affirmative Action in Business

J. Angelo Corlett  
Philosophy & Ethics, San Diego State University,  
San Diego, CA, USA

## Introduction

Affirmative action is a legally and policy-based practice in the USA in which various programs target individuals who are members of particular ethnic groups and white women in order to achieve certain aims of broader public policies such as

equal opportunity in education and employment. Such policy aims are not always clear. But they range from desired equality of opportunities for the least advantaged in society to desired “diversity” among members of a particular environment to the provision of what certain classes of people deserve in light of historic harmful wrongdoings which they or their ancestors have experienced in the USA as a class of people. There is affirmative action in all ranks of education and affirmative action in business with regard to the hiring and retaining of persons into the workplace. While affirmative action is often confused with reparations of the compensatory variety, the latter are paid to those whose rights have been violated (or to their heirs), while the former often target those who are perceived to have been disadvantaged or whose inclusion in business contexts creates and sustains the perceived value of “diversity.”

In the USA, affirmative action in business occurs in at least two broad ways. One way in which it occurs is at the level of hiring at the executive level, and the other happens at the employee or nonmanagement level. In either case, the usual reason for it is to balance business with a diversity of peoples for the sake of equality of opportunity and representation of such groups in business. Exactly what is meant by “equality” and “diversity” is uncertain. However, it is clear that forward-looking utilitarian justifications for such affirmative action policies are most often provided for most supporters of such affirmative action policies and programs.

Generally, the utilitarian justification for affirmative action in business is that it provides equality of opportunity to the least advantaged in society so that such persons might be better able to thrive in business, making society stronger because it is more diversified from a business standpoint. Moreover, such affirmative action policies serve to provide positive role models for younger members of such groups targeted by affirmative action policies, thereby providing a stronger business environment for the future for those whose future prospects lie in business.

Detractors of affirmative action policies in business contexts often argue that such policies amount to “reverse discrimination” wherein white

males are disadvantaged with respect to affirmative action targets. According to this objection to affirmative action policies and programs, reverse discrimination eliminates fair competition between citizens to compete for employment opportunities. Those who are the most qualified for positions in business contexts ought to be awarded the positions, it is argued. And affirmative action policies and programs thwart such ideals; thereby reducing the competition that is argued would otherwise make for a better future for businesses, qualitatively speaking. Another objection to affirmative action in such contexts is that it fails to target white males who are disadvantaged, though a utilitarian justification of affirmative action seeks to include such disadvantaged white males in order to better society as a whole.

In defense of affirmative action policies and programs and against the first part of the objection, it is replied that the objection in question is sound only in an ideal world where ethnic discrimination and sexism are minimized or absent. But since the USA was founded on and persists as a society having such thoroughgoing problems, policies and programs such as affirmative action are required for the sake of justice and fairness, including equality of opportunity.

It is important to note that the foregoing discussion is largely between opposing parties each of whom is utilitarian in character, wherein it is only future-oriented factors that are important to the discussion of the moral status of affirmative action policies. But there are backward-looking arguments concerning the moral status of said policy.<sup>1</sup> One backward-looking objection to a utilitarian approach to affirmative action is that it neglects the rights of the members of targeted groups to compensatory justice. On this view, the aim of affirmative action policies and programs is to provide equality of opportunities in education and employment. If this is true, the objection states, then members of targeted groups have certain rights to affirmative action that imply

that there is a duty to governments to provide, rights that cannot be overridden by social utility maximization.<sup>2</sup> Thus programs of affirmative action constitute a right that is possessed by members of various groups that have been harmed by and in US society: American Indians, US blacks, etc.

Backward-looking arguments concerning affirmative action policies come in at least two general varieties. One such variety opposes such policies because they constitute programs that are unjust because they are unfair to those who are not targets of such policies. White males who are not included in affirmative action programs, it is argued, have done nothing wrong such that they deserve to be victimized by such policies and programs. Without such policies and programs, it is argued, only the deserving would be hired at whichever level of business. And only the genuinely deserving ought to be hired in the first place. So affirmative action policies and programs ought to be eliminated because they are unjust and unfair to those who are not the targets of them.

In reply to the foregoing backward-looking arguments against affirmative action policies and programs, it is argued that the argument problematically assumes that there is a “level” playing field of competition for employment opportunities in business. However, this assumption is so problematic that it is disingenuous. First, one need not look further than former US President G. W. Bush to understand that if intelligence, honesty, integrity, and the like are necessary or even sufficient conditions of that office, he lacked perhaps every quality that would make for a good president. Yet even a white male as poorly qualified for public office such as Bush was actually “appointed,” however unconstitutionally, as the US president! In US business, it is surely neither a just nor fair playing field. For many a white male in a high profile position holds his position almost solely because of who he knows rather than what he knows or by virtue of otherwise objective qualifications for that position. This is unjust because

<sup>1</sup> The distinction between forward-looking and backward-looking perspectives on affirmative action is found in Boxill (1984: 147–172) and McGary (1999: 125–144).

<sup>2</sup> That rights ought never to be trumped by considerations of social utility is found in John Rawls (1971: 1–5).

unfair playing field is so rampant throughout US society that it is disingenuous to deny it. And given its prevalence throughout the US business world, it is argued that affirmative action policies and programs are needed to balance out the undeservedness of so many positions occupied through US history by undeserving white males. Thus the argument from deservedness is turned on its head in favor of affirmative action policies and programs.

But there are those who would argue that even if affirmative action policies and programs are justified in principle, in practice they are problematic and must be rejected and disbanded. They argue, for instance, that “two wrongs don’t make a right” in hiring unqualified folk to “replace” or instead of underqualified white males in business. On this view, affirmative action amounts to “reverse discrimination” and does more harm than good in business contexts because it creates and sustains worker and employer discontent

However, this point seems to assume that such positions in business are somehow owed to white males – even underqualified ones! But surely this cannot be the case even if it is true that the most qualified person ought to be hired. And it is disingenuous and perhaps even racist to assume (absent adequate evidence) that those who are not white males cannot qualify or be trained to qualify for said positions. Yet one reason for the very policies and programs in question is to create and sustain programs that would provide businesses with qualified folk who could occupy such positions, thereby increasing the quality of productivity in businesses overall. College- and university-level affirmative action policies and programs are available to prepare people to qualify for executive or skilled positions in business, while unskilled labor positions can be filled by untrained personnel who qualify as targets of such policies and programs. So here is where the backward-looking argument from desert is coupled with a forward-looking consideration that attempts to maximize social utility, further turning the argument in question against affirmative action policies and programs on its head.

However, there is a new approach to affirmative action that has been developed which affirms

the need for such policies and programs but seeks to restructure it in order to rid it of some of its persistent fundamental injustices and unfairnesses. It is primarily a backward-looking desert-based approach, yet one that construes forward-looking considerations as also being important. It is referred to as the “differentialist approach to affirmative action” because it categorizes each group which is targeted by such policies and programs according to each group’s degree of harmful wrongdoing which it has suffered in the USA. It uses history to determine the facts which in turn determine the level at which each group ought to receive affirmative action support (Corlett 2003: Chap. 7; Corlett 2010: Chap. 10).

According to the differentialist approach to affirmative action, then, American Indians and blacks<sup>3</sup> ought to receive the greatest level of affirmative action assistance. Far down the list would be Latinos/Latinas, Asians, etc., with the women and girls in each group receiving a greater amount of affirmative action support than their male counterparts in that they also experience(d) sexist harmful wrongdoings. But because white women generally were and remain part of the oppressive and discriminatory forces over such groups, they should be eliminated from and should have never been allowed to be targeted by affirmative action policies and programs. Generally and as a class, white women have been victimized far less than, say, American Indian and black women and men. So they ought not to be included in affirmative action programs as they have been from their very inception. For it is not only undeserved on their part, but the inclusion of white women in affirmative action programs diverts much needed and deserved resources from those more deserving of them. This differentialist conception of affirmative action assumes that reparative justice will not accrue to such groups. In such a case, substantial increases in affirmative action resources are required because that is what is required, morally speaking, in terms of what such parties deserve given their respective histories of oppression

<sup>3</sup>By “blacks” is meant those of African descent whose ancestors were enslaved in the USA.

(in the cases of American Indians and blacks) and discrimination (with respect to members of the other groups) (Corlett 2003: Chap. 7; Corlett 2010: Chap. 10).

While many argue that white women in the USA ought to remain targeted by affirmative action programs because they too were/are oppressed, several problems face such a claim. First, this claim cannot be substantiated except by a future-oriented and non-backward-looking version of a utilitarian, rights-disrespecting “ethic” which denies a victim’s legitimate moral claim to or interest in being compensated in albeit approximate proportion to the harms suffered by one’s predecessors. To claim that white women on average and as a class were and are oppressed in the USA in anything akin to the manners in which American Indian women and men were/are oppressed in the USA is disingenuous due to the fact that white women on average and as a class played and continue to play a major role in the oppression of nonwhites in US society. For instance, even the most progressive of white women have played major roles in the discrimination of US blacks (Davis 1981; Corlett 2010: Chap. 10; hooks 1981). The differentialist analysis of affirmative action, while not falling prey to the category mistake of construing reparations as affirmative action or vice versa, refuses to categorize white women as being oppressed in any manner in which American Indians and US blacks were and are oppressed in the USA. Thus white women should not at all be considered as targets of affirmative action as that would serve as a moral insult to the members of the other targeted groups which have experienced genuine oppression and not simply discrimination. At the very most, white women ought to be placed at the bottom of the list of affirmative action recipients due to their considerable roles in oppressing or otherwise discriminating against nonwhites in US society.

All of this implies that white women in US society should not remain as serious targets of affirmative action policies and programs as they currently are and have been for decades as this robs much needed resources for members of groups that have been and remain historically

wronged by US society in ways that far surpass whatever discrimination that white women have experienced and continue to experience. So in business contexts, affirmative action policies and programs should be narrowed to differentially and mostly target American Indians and US blacks. To proceed in this way would be to begin to take seriously what the US business communities owe to American Indians and US blacks far more than any other groups in US history. For from the very beginning, US businesses from banks to shipbuilders to investors played roles in both the oppression of American Indians and US blacks in ways that are unprecedented in world history.<sup>4</sup> And while it is a category mistake to conflate affirmative action with reparations and vice versa, correcting the confused ship of affirmative action is imperative if justice is to begin to accrue to genuinely oppressed groups in US business contexts.

In practical terms, the differentialist approach to affirmative action would function along the following lines. In a business, those conducting the hiring would do all they could to recruit reasonably qualified hires from the pools of American Indian and US black applicants for a particular open position. Within these categories of applicants, the women would be given preference. Only when recruiters can prove that they have conducted a reasonable recruitment effort from such pools would they be permitted by the policy to proceed to, say, Latino/Latina pools of applicants, then to Asian-American applicants, etc., each time giving preference to women over their male counterparts. White women would then be targeted and lastly white males. Sensitivity must be demonstrated to the fact that some applicant pools will not contain many American Indians and/or US blacks. With competition to hire the most qualified employees and executives, businesses will have difficult times hiring American Indians simply because the demand is high and the supply is low, generally speaking. But every reasonable effort must be made to recruit such

<sup>4</sup>For an account of how US businesses sustained the slave trade, see DeWolf (2009).

applicant candidates. A roughly similar problem arises with regard to US blacks, though there are millions more such persons in the USA than there are American Indians. Subsequent to reasonable efforts being made to recruit American Indians and US blacks, businesses are to attempt as best they can to hire from the pool of Latinos/Latinas, then from the pool of Asian-American applicants, etc. Because of the low supply and high (affirmative action) demand for potential American Indian and US black hires at least in certain skilled positions, businesses which have taken reasonably strong steps and in good faith to hire from these categories ought to be shown understanding if they are unsuccessful in doing so. But such businesses, if affirmative action is indeed mandatory as a matter of law and public policy, must demonstrate to the standards of such laws and policies that they have complied with them as best they could given current factors of supply and demand of available qualified applicants from the targeted groups mentioned. This must be understood in light of the fact that the more productive and successful American Indian and US black skilled employees and executives will likely not be sufficient to fill each of the positions available in any given market. However, businesses which fail to satisfy the standards of recruitment and retention of said affirmative action hires would stand to face significant sanctions, from adverse publicity of the business to substantial fines handed down to said businesses. All of this assumes, of course, a capitalist or some other mode of production wherein factors of supply and demand of employees and executives are relevant.

However, insofar as adequate compensatory reparations are provided for American Indians and US blacks, it would appear that they would then have no justification to remain on the list of affirmative action targets. For their respective experiences, both historic and contemporary, of injustice within US society would have thereby been rectified. Affirmative action policies and programs, then, could target members of the other groups listed according to the degree and duration of the harmful wrongdoings experienced by them in and by the USA.

## Affirmative Action: Employment Equity in Canada

Deborah C. Poff

Leading with Integrity, Ottawa, ON, Canada

Brandon University, Ottawa, ON, Canada

## Synonyms

Affirmative action; Compensatory justice; Redistributive justice

## Definition

Employment equity is the term in Canada for what is known as affirmative action in the United States. In 1984, the Canadian Royal Commission on affirmative action defined that term as "employment equity."

Known colloquially as the Abella Commission on Employment Equity, after the chair Justice Rosalie Abella, employment equity is identified as "a strategy designed to obliterate the effects of discrimination and to open equitably the

competition for employment opportunities to those arbitrarily excluded,” requiring a “special blend of what is necessary, what is fair and what is workable” (Abella 1984).

## Introduction

In this article, first the context which led to the establishment of a federal commission on employment equity and the legislation which followed are discussed through a brief exploration of the history of women’s equality rights in Canada. Then a presentation about employment equity in Canada is explored, including a discussion on the strengths and limitations of employment equity in Canada. Next, the current data on the groups identified as systemically discriminated against will be presented. Finally, the ethics arguments against employment equity or affirmative action are described and analyzed.

It should be noted that while this chapter will provide information on all of the four groups that fall under the employment equity act, the history for such legislation will be examined through the lens of discrimination against women. Other chapters within this encyclopedia provide additional information on the history and current status of other identified groups.

## Votes for Women and the Person’s Case

Women in Canada were granted the right to vote between 2016 and 2019. Women in the suffrage movement in Canada had been active in seeking the right to vote from the 1870s onward, but it was women’s role in World War I that served as the same catalyst as it did in many other democratic nation states in securing the vote for women. As noted by Historian Strong-Boag (2019):

Once conscription was secured [in Canada], the government began to argue that women had earned the right to vote through their war work. On 24 May 1918, female citizens, not included under racial or Indigenous exclusions, aged 21 and over became eligible to vote in federal elections regardless of whether they had yet attained the provincial franchise. In July 1919, enfranchised women gained the

right to stand for the House of Commons... (Strong-Boag 2019)

It was surprising for women to discover, however, once they had been granted enfranchisement, that they were not considered legally to be persons. The notion of a legal personhood is an important condition for the establishment of many rights, duties, benefits, and obligations within, so it is not an inconsequential issue. In this particular case, it was determined that women could not be appointed to the Senate of Canada because they were not persons.

The Persons Case, as it known and celebrated in Canada every October 18, was finally settled by the Privy Council in Britain on October 18, 1929, after years of appeals through the courts in Canada. In rendering his decision:

...Lord Sankey, Lord Chancellor of the Privy Council, announced the British Privy Council decision [and stated] that ‘yes, women are persons...and eligible to be summoned and may become Members of the Senate of Canada.’

As Munroe (2019) further notes:

The Privy Council decision also said that ‘the exclusion of women from all public offices is a relic of days more barbarous than ours. And to those who would ask why the word ‘persons’ should include females, the obvious answer is, why should it not.’ (Munroe 2019)

But while women did make progress in the early part of the century, more general social and economic progress was still a long way off.

In 1967–1970 when women were earning 59 cents for every dollar earned by men, women in Canada once more were politically active and engaged in protest. Laura Sabia, among many other feminists at the time, threatened to bring one million women to march on Parliament if the Prime Minister did not establish a Royal Commission on the Status of Women in Canada. Consequently, Prime Minister Lester Pearson did establish such a commission in 1967 which duly reported to Parliament in 1970. This activism was not unique to Canada. President John Kennedy in the United States established a similar status of women commission in 1961, initially chaired by Eleanor Roosevelt until her death. Both of these

commissions found strong evidence of women's discrimination across a number of social, political, and economic domains. Similar findings around the world led the United Nations to declare 1975 International Women's Year. This in turn, led the United Nations Decade for Women and further UN world conferences on women the last of which was held in Beijing in 1995.<sup>1</sup>

During the decade for women, the Canadian government "repatriated" and formally created Canada's first complete constitutional document under the Constitution Act of 1982 including the Canadian Charter of Rights and Freedom. Particularly relevant to women and other discriminated groups, the constitution included the following equality rights section which states,

15(1) Every individual is equal before and under the law and has the right to the equal protection and equal benefit of the law, without discrimination and, in particular, without discrimination based on race, national or ethnic origin, colour, religion, sex, age or mental or physical disability.

15(2) Subsection (1) does not preclude any law, program or activity that has as its object the amelioration of conditions of disadvantaged individuals or groups including those that are disadvantaged because of race, national or ethnic origin, colour, religion, sex, age or mental or physical disability.<sup>2</sup>

This section of the constitution not only affirms equality rights but also through 15(2) affirms the constitutionality of mechanisms to address systemic discrimination. The constitutionality of establishing mechanisms to ameliorate systemic discrimination was then specifically addressed through the establishment in 1984 of the Royal Commission on Equality in Employment.

This federal government commission, which was chaired by Judge Abella, identified four groups in Canada as categories of persons who, in the opinion of the commission, had been and continued to be systemically discriminated against in employment. These groups are women, people with disabilities, Aboriginal peo-

ples, and visible minorities. The commission report was submitted to the government of Canada in October 1984.<sup>3</sup> This was followed by the federal Employment Equity Act of 1986 which has subsequently been revised and amended.

According to the government of Canada, the Employment Equity Act applies "to federally regulated industries, Crown Corporations and other federal organizations with 100 employees or more, as well as portions of the federal public administration...which includes the Canadian Forces and the RCMP." (Employment Equity in Federally Regulated Workplaces 2018).

Two early criticisms of the Employment Act included the following: (1) given that no quotas for employment equity were imposed by the legislation, so it is difficult to judge whether any progress is being made even though the act does require annual reporting and monitoring and (2) that the terms of the legislation should have been more inclusive. Each criticism is addressed as follows.

### No Quotas

The federal employment equity act imposed no quotas. Instead, employers are required to report on all hirings and report on the number of candidates in employment searches annually. More generally, systemic discrimination can be tracked through Canadian statistics regarding the number of available employees in each relevant group. However, since self-identification of belonging to any of the four identified groups in Canada is voluntary, it can be argued that even reporting on employee searches is, at best, a very incomplete and unsatisfactory monitoring process.

### Lack of Inclusivity

The second criticism is that not all employees are captured in the employment equity legislation. One argument in favor of this exclusion is that the government does not want to impinge on the rights of small family businesses to determine

<sup>1</sup> The United Nations Decade for Women, Equality, Development and Peace. [UNWomen.org](http://UNWomen.org)

<sup>2</sup> Constitution Act, 1982. The Canadian Charter on Rights and Freedom, article 15. <https://chrc-ccdp.gc.ca>

<sup>3</sup> Abella (1984).

their employees. Another argument is that the government does not want to stifle entrepreneurship and small companies which may have difficulty in start-up and general operations if they must follow equity standards. While some of these arguments sound *prima facie* reasonable, there is an arbitrary judgment in determining less than 100 employees as the cutoff.

### What Employment Equity Cannot Do

Before looking at how the four designated groups in Canada are doing, it is important to note the limitations of employment equity (and affirmative action) in solving problems of systemic discrimination.

Systemic discrimination involves many factors that include such stigmatizing variables as sexism and racism. The discriminatory factors include social, cultural, economic, and religious beliefs that result in the treatment of some persons as inferior than others. Mitigating the impact of these complex variables on work discrimination must be reflected in long-term strategies to improve access to education, human rights, and mechanisms to change attitudes and enforce laws to lessen discrimination on persons based on unreasoned bias and sometimes hatred. Without more inclusive approaches to the elimination of discrimination that is based on bias rather than bona fide job requirements, such discrimination will continue to harm members of discriminated and designated peoples in Canada.

Groups identified in the employment equity act include persons who both have been historically and are currently discriminated against by virtue of their membership in these groups.

### Employment Equity Today in Canada

This discussion particularly focusses on each of the four groups of persons identified as categories of workers who have faced and continue to face employment discrimination.

### Women

Pelletier et al. (2019) note the following:

Recent studies indicate that, in general, the gender wage gap has narrowed over time, both in Canada...and elsewhere...However, given that women in Canada have surpassed men in educational attainment, diversified their fields of study at post-secondary institutions, and increased their representation in higher-status occupations (Moyser 2019), the persistence of gender-based wage inequality warrants continued attention.

This study which covers Canadian Labour Statistics from 1998 to 2018 states that women in Canada make on average 13.3% less per hour than their male counterparts (Pelletier et al. 2019).

Clearly women have made significant gains since the Royal Commission on the Status of Women, but the lack of parity between women and men with respect to wages seems to be a by-product of discrimination simpliciter.

### Visible and Immigrant Minorities

There are a lot of data, in Canada, and around the world to confirm that immigration results in discrimination in many domains including the workplace. There are consequently a number of UN Decades which address the various forms of discrimination which face immigrants. With respect to Canada, there are data that are encouraging although there are still clearly indications of inequality between Canadians born in Canada and persons who immigrate to Canada.

Underemployment and wage gaps are due to a number of factors, including “language skills, foreign qualification and skill recognition, and discrimination.” Further, in 2017 among university-educated immigrants, the employment gap “between...[immigrants] and their Canadian born counterparts narrowed to its smallest size since 2006” (Yssaad and Fields 2018). The study reported that the wage gap between Canadians and immigrants decreases the longer immigrants live in Canada. All of the information confirms that education to diminish discrimination as well as interventions to assist in language acquisition and education improves conditions for immigrants in Canada.

## Aboriginal People (First Nations, Metis Nations, and Inuit People in Canada)

Aboriginal people in Canada suffer from a history of discrimination, displacement, and the impact of colonization, including residential schooling. The Truth and Reconciliation Commission of Canada was formed to address some of the negative impacts on Aboriginal people from their individual and collective experiences of involuntary residential schooling.

According to a 2017 Statistics Canada report on the employment of Aboriginal people living off-reserve, the following conditions exist:

- Higher unemployment rates than non-Aboriginals.
- Lower levels of educational attainment than non-Aboriginals.
- Lower earnings than non-Aboriginals due to lower qualifications (“Among those with a post-secondary certificate/diploma or university degree, Aboriginal people earned at least as much on average as their non-Aboriginal counterparts.”) (Moyser 2017).

While employment equity, with its direct and indirect influence on mitigating racial discrimination, is important, it is clear from the data cited here that fostering access to higher education is perhaps the most strategic activity in promoting equality of results in employment.

## Disabled Persons

The Canadian government (2018) identified disability types as follows:

Of the 22% of Canadians who are disabled “disabilities related to pain, flexibility, mobility, and mental health were the most common disability types”. Further “among those aged 25 to 64 years, persons with disabilities were less likely to be employed (59%) than those without disabilities (80%)”.

Ability to work is a clear factor in economic security. The Canadian government both ratified

the United Nations Declaration on the Rights of Persons with Disabilities (1975) and the United Nations Convention on the Rights of Persons with Disabilities which was ratified in Canada in 2010. Article 27 of the Convention specifically addresses rights from discrimination in work and employment (The United Nations Convention on the Rights of Persons with Disabilities (CRPD) 2006).

In a recent document monitoring the UN Convention on the Rights of Persons with Disabilities (2018), it is stated that:

“...the employment rates of both women (45%) and men (49.8%) with disabilities are substantially lower compared to those of women (70.1%) and men (77.1%) without disabilities. . . . Nearly 30% of persons with disabilities report having asked for workplace accommodation that was not made available.” When we add to this that 69% of businesses in Canada have never hired disabled persons, it is clear that Canada has a long way to go to reach employment equity for persons with disability (The UN Convention on the Rights of Persons with Disabilities 2018).

## Summary of Employment Equity in Canada

While some conditions have clearly improved over time, there are still considerable barriers to employment equity in Canada. Women’s economic status has significantly improved although there is still resistant and continuing residual discrimination. Similarly, visible and immigrant minorities in Canada do continue to face workplace inequities although educational achievement and time spent in Canada mitigate against some forms of workplace discrimination. Canada’s Aboriginal peoples still need support in accessing and achieving higher levels of education. Finally, access to employment for persons with disabilities continues to be ineffectively addressed and managed.

Clearly human rights and equity issues are far more complex than employment equity

legislation can address alone. Constitutional protections, UN declarations, national human rights legislation, and educational access all must support equality and anti-discrimination ends.

### **Objections to Anti-discrimination Legislation, Like Affirmative Action and Other Initiatives, That Would Reduce Inequity**

As noted at the beginning of this article, this chapter will end with a brief discussion of some classic objections to employment equity measures. Given the lack of quotas imposed by the Employment Equity Act, it is not clear that the classic arguments against Canada's employment equity legislation have the same force. Most of the literature on these objections refer to the United States context over the past 40 years. See other articles in the encyclopedia for detailed treatment of these topics. Given that these arguments continue to be discussed, this article ends with them.

It should be noted that all three objectives cited here are based on false assumptions. One is the mythology of equality of opportunity, and the second is the assumption of objectivity in hiring practices.

### **Equality of Opportunity**

Equality of opportunity is the assumption that if positions are widely advertised and open to all applicants, justice and fairness will be served. The position falsely assumes that all persons are equally situated and begin the competition from the same starting place. This has been falsified by a number of empirical studies.

### **Assumption of Objectivity in Hiring Practices**

Hiring committees and individuals hire people. Some are biased by beliefs and membership in particular cultures and economic and social

backgrounds. While there are variabilities in the research, many studies confirm, for example, that perceived attractiveness has a positive influence in hiring (Quereshi and Kay 1986).

### **Reverse Discrimination**

One argument against policies which are put in place to rectify discrimination against groups is that the result is reverse discrimination which is morally wrong. The argument is that all discrimination is morally unacceptable including employment equity mechanisms and any preferential treatment in access to employment or access to educational programs. Such policies and mechanisms, it is argued, necessarily involve a kind of reverse discrimination against those who do not belong to these targeted groups.

The argument further states that if prejudicial discrimination is wrong, it is because all discrimination based on nonrelevant and nonmeritocratic bona fide requirements for a position or place results in the same problem that is supposedly being solved, namely, unfair discrimination.

### **Objections**

The argument with respect to reverse discrimination is that it is predicated on the false assumption that without evidence-based mechanisms adopted to address systemic discrimination, the result of hiring into an employment position would be a function solely of qualifications. Hence, it is argued that a more qualified candidate would not be unfairly discriminated against and would be hired without intervening through some mechanism of employment equity. The underlying assumption is an appeal to an equality of opportunity principle which, as noted, is more mythical than reality based.

### **Tokenism**

The tokenism argument is predicated on the assumption that persons are hired solely by virtue of their membership in a group which has been discriminated against (e.g., a woman in a senior executive position). The argument is further elaborated to say that such persons are inadequately prepared for the role and will consequently fail, to

the detriment of the individual and the organization. This argument is generally argued without empirical support and consequently merely an assumption.

### Compensatory Justice

The argument for compensatory justice is that individuals who are members of groups of people, such as the four groups identified in the employment equity legislation in Canada, will be individually treated preferentially in hiring based on historic discrimination despite no current discrimination. The result in this case could be privileging someone who is not discriminated against in favor of an individual who is not a member of an identified group (such as a poor white man in favor of a rich white woman).

### Objections

There are a number of dubious assumptions made here, the most obvious being that one variable, such as class or education, trumps sexism which continues to be a factor in women's status in society. However, some types of privilege do not nullify all forms of discrimination. Thus, a woman, having grown up in a high-income family, is not immune from all forms of sexism. The reverse discrimination argument in the also assumes similar false or dubious claims already discussed with respect to tokenism and reverse discrimination.

## Age Diversity and Generational Ethics

Carole L. Jurkiewicz

School of Public Affairs, University of Colorado  
Colorado Springs, Colorado Springs, CO, USA

### Synonyms

Age cohort; Age group; Baby boomers; Ethics; Gen X; Gen Y; Generations; Greatest generation; Millennials; Morals; Peer group; Social norms; Values; Work ethic; Work motivation; Workplace values

## Introduction

A comprehensive assembly of assumptions regarding generational values and their translation into behavior offers insight and directions for further study. Flaws in the existing models of generational values and the need to examine perhaps outmoded presumptions about the length of age cohort as asserted by Strauss and Howe and widely accepted as standard time period from one to another. An argument for expansion of the Rokeach Value Survey is presented, and speculation about the impact of the COVID-19 pandemic on value development among today's children is introduced. Compiled from disparate sources, this study provides a rich foundation for future research.

## Age Diversity

Debate over the viability of defining generational cohorts as discrete groups is nearly as common as encountering the nomenclature that tags them, such as Boomers, Gen X, and Gen Z, etc. Most agree that generational assignment is an imprecise tool of study that unnaturally separates people into groups by absolute birth dates, and that it can lack consideration of cultural differences and the possibility that values may change as individuals mature through different stages of their lives (Jurkiewicz and Bradley 2002; Campbell et al. 2017). Each generation has been characterized as disrespectful of rules and authority, lacking employer loyalty, wary of the future, and more self-absorbed than others when at the early adult stage of their life cycle, only to be stereotypically labeled as too cautious and judgmental at the other end of the age continuum (Jurkiewicz 2002b). Generational categories are considered to be more accurately defined as sets of contiguous birth years grouped around the political, economic, and social issues they share in common during their formative years, rather than as strict age silos (Jurkiewicz 2013; Jurkiewicz and Grossman 2012). Further, the majority of the scholarly literature in this area is US-focused and

does not reflect other countries' unique environments.

Yet the value of clustering individuals into age-based groups allows for analytical constructs and comparisons otherwise impossible (Campbell et al. 2017), despite the caveat that those within the cusp between generational categories may share characteristics of both. It is highly unlikely that an individual born in 1981 has vastly different values than one born in 1982. This is borne out in the slight variations in birth date categories asserted by different sources. The birth dates used here to define generations follow the framework first asserted by Strauss and Howe (1973) in their foundational study, separating the groups into 17–20 year spans that account for both biological reproduction and significant historical cycles. At the time they completed their study, with data from the 1980s, the average age of first-time mothers was roughly 20 years old across all demographics. While the average of first-time mothers remains close to 20 years of age today in rural areas and among those without a college education, it is roughly 31 in metropolitan areas and among those with a college degree. Given the dramatic population shift over the past 40 years, about 62.7% of people in the USA live in metropolitan areas, according to the most recent data available. Further, roughly 33% of women hold at least a Bachelor's degree today as compared to 15% in the 1980s (U.S. Census Bureau 2019).

Thus, age-defined generations span about 30 years for the majority of the population today, a half-generation longer as compared to the 20-year span framed by Strauss and Howe (1973). Concomitant with the difference in birth rate is a profound difference in value systems between those who live in metropolitan areas as compared to those who do not. Further, over 40% of children born today are born to unmarried women, an increase of over 80% since the 1980s; the two groups largely lead very different lives with distinctly separate moral imperatives. These disparities in generational turnover may explain the fuzziness of definitions detailed by Campbell et al. (2017). It seems an update of

their analysis is warranted to bring generational categories current and assess whether the assumptions on which researchers are building their models still holds true.

### Sector as Generational Bond

Although inexact, the value of generational research has been firmly established in the literature. Some of the most important findings in this area are that individuals who work in a particular sector share more values in common regardless of generational cohort (Jurkiewicz 2000; Campbell et al. 2017). Whether individuals self-select into sectors that are a better match for their values, rather than adjusting their values to fit the environment, is a question that has been addressed from a number of perspectives (e.g., Jurkiewicz and Grossman 2012; Jurkiewicz and Giacalone 2004). Collectively, the evidence strongly suggests individual value systems remain relatively constant over time presuming no extraordinary circumstances, and self-select into a career sector based on the assumptions and beliefs they hold on whether there will be a good organization-person fit. If these assumptions and beliefs are incongruous with the organization or sector in which they work, they are likely to leave for other, more agreeable, career opportunities. If they do stay despite the disparate value systems, either through lack of other opportunities or superseding needs that take precedence over the incongruity, they can suffer physically and psychologically, their families and social networks can be negatively affected, and they could engage in organizational sabotage behaviors (Jurkiewicz and Giacalone 2017).

Just as the birth years vary slightly across multiple sources, so too do the labels and descriptions of the generations. Table 1 identifies the extrinsic influencers for each cohort as they are commonly known today, along with the characteristics considered most relevant for each in terms of political, social, and economic impact.

### Values-Ethics Connection

The descriptors used to delineate generations are generally rooted in cultural models and tend to be self-reinforcers as individual within and between groups seek to fit the generalizations and identify with others who share those orientations and age cohorts (e.g., Jurkiewicz 2000). Further, evidence suggests that generational values are cyclical in nature (Strauss and Howe 1973). It is a reactionary model wherein generations rebut their parents' views and more closely embody the values of their grandparents, and their children in turn will more closely resemble their parents' parents; essentially, it is an ebb and flow of value preferences over time (Jurkiewicz 2000). Results from US national studies suggest that, comparing generations at similar points in time, such as when each was a young adult or at retirement age, they are much more alike than not (cf, Jurkiewicz and Bradley 2002).

Most individuals are unaware of the foundational values that direct their behavior, and only bring it into awareness when their value systems acutely conflict with others in a position of authority, either referent or positional (Jurkiewicz and Bradley 2002). Values develop from our experience in the world in our formative years, including authority figures, media, schooling, age cohort, and socioeconomic status (Jurkiewicz 2020). Some argue that values and ethics have a biological source, although the evidence lacks robustness. Generational cohort is believed to influence an individual's value system (Jurkiewicz 2013a). One's beliefs and attitudes fuse into systems reinforced by selective perception and self-reinforcing behaviors. At the core of this system is a set of values that can be measured using Rokeach's (1973) preeminent Values Survey (RVS) (cf, Jurkiewicz 2000; Jurkiewicz and Bradley 2002). The Survey is grouped into 18 instrumental and 18 terminal values. Terminal values represent the goals to which an individual strives, and the instrumental values are the moral standards s/he implements in achieving the desired end states; each are ranked in order of preference. The values are the foundational blocks of ethical decision-making and the behaviors that

**Age Diversity and Generational Ethics, Table 1** Perceptions of generational cohorts

| <i>Social</i>             | Fluid gender roles, hopeful about future and ability for society to change, social networks, distrust of others  | Structured childhood, helicopter parents, taught to believe they're always winners, self-confident, increased violence, less altruistic                               | Values leisure time, not concerned with prestige, self-reliant, need for achievement, recognition, status, self-development | Spiritual awakenings, psychedelic drugs, student protests, fast food, dinner parties, suburban growth, consumer fads, increased emphasis on public health | Traditional gender roles, hard work, subjugate self for family, socially conformist, trusting of others |
| <i>Work</i>               | Facetime interaction, multiple social media accounts, change jobs often                                          | Prefers in-person contact, views self as contractor not employee                                                                                                      | Seeks work/life balance, loyalty to career not employer                                                                     | Obedient to employer, focus on family, early tech adopters                                                                                                | Loyal to employer, minimal turnover, paternalism                                                        |
| <i>Historical markers</i> | Global focus, climate change, wiki-leaks, cloud computing, hackers, create own media presence, COVID-19 pandemic | 9/11 attacks, wars in Middle East, reality TV, social protests, dot-com busts, primacy of internet, second gulf war failures, First gulf war, silent spring published | Live aid, toppling of Berlin wall, rise in single parenting, latch-key childhood, increase TV watching, watergate, bank     | Cold war, Vietnam, drug culture, Woodstock, post-WW II financial boom, moon landing, civil rights                                                         | WW II, rationing, nuclear power, fixed gender roles, disconnected from tech, rock and roll              |

result; they remain relatively stable over a lifetime (Rokeach 1973; Jurkiewicz 2013; Jurkiewicz 2020). Individuals do not consistently make decisions that will maximize their opportunities to achieve their values, as leaders, situational circumstances, social networks, and physical/psychological states that weaken one's willpower all play an intervening role (Jurkiewicz 2013a, 2020). In an array of studies (cf, Jurkiewicz and Bradley 2002), employees report that the

competitive pressures in their workplaces require ethical comprises that are counter to their value systems, and that this is a key source of stress and ill health (Jurkiewicz and Giacalone 2017). Ethical codes, at best, are but a general statement of aspirational values for an organization, it is the ethical culture that inductively determines its operational values. Table 2 outlines the value systems associated with the generational cohorts, in terms of what they desire in their workplace,

**Age Diversity and Generational Ethics, Table 2** Anticipated workplace values by generational cohort

| RVS terminal values                                      | Gen Z | Millennials | Gen X | Boomers | Matures |
|----------------------------------------------------------|-------|-------------|-------|---------|---------|
| A comfortable life (a prosperous life)                   |       | X           |       | X       |         |
| A sense of accomplishment (a lasting contribution)       | X     |             | X     | X       |         |
| A world at peace (free from war and conflict)            | X     |             |       |         | X       |
| A world of beauty (appreciating nature and the arts)     | X     |             |       | X       | X       |
| An exciting life (a stimulating, active life)            |       | X           | X     |         |         |
| Equality (equal opportunity and treatment for all)       | X     |             | X     |         |         |
| Family security (taking care of loved ones)              |       |             |       | X       | X       |
| Freedom (having independence, free choice)               | X     | X           | X     |         |         |
| Happiness (being content and fulfilled)                  | X     |             |       |         | X       |
| Inner harmony (freedom from inner conflict)              | X     |             |       | X       |         |
| Mature love (sexual and spiritual intimacy)              |       |             |       |         | X       |
| National security (no threats of terrorism or attack)    | X     |             |       | X       | X       |
| Pleasure (an enjoyable, leisurely life)                  |       | X           | X     |         |         |
| Salvation (spiritually saved, anticipating eternal life) |       | X           |       |         | X       |
| Self-respect (self-esteem)                               | X     | X           | X     | X       |         |
| Social recognition (respect, admiration)                 |       | X           |       | X       |         |
| True friendship (close companionship)                    |       |             | X     |         | X       |
| Wisdom (a mature understanding of life)                  | X     | X           | X     |         |         |

Hypothesized assumptions culled from research reported in Jurkiewicz and Bradley 2002, extrapolated from Campbell et al., and compiled from multiple reports in the general media

framed by Rokeach's terminal value constructs (Rokeach 1973).

## Generational Values

The literature asserts what the generations likely value most from their work. While there is some empirical evidence that tests these assumptions (e.g., Campbell et al. 2017), it is primarily cross-sectional and focuses mostly on Gen X and Millennials, and is in great need of longitudinal studies. It is the perception of generations that is the focus here, toward the end of building a foundation for these needed studies, to test the accuracy of public perceptions against the reliability of the Rokeach Values (1973). Along with what is detailed in Table 1, Matures are presumed to be trusting, loyal to their employers (whether referring to past or current employment patterns), accepting of paternalistic management, and unlikely to change jobs over their careers. They are said to value career and financial security above family time as a demonstration on their

commitment to provide for their families; earning and saving money are key goals. Boomers are viewed as obedient to employers' dictates and receive high levels of job satisfaction but place their primary focus on family and warm relationships with co-workers. They are also flexible in adopting new technologies, both as a means to stay in contact with their children and also to continue in their careers beyond the customary point of retirement (Jurkiewicz and Bradley 2002). Gen Xers are thought to receive greater satisfaction working as independent contractors rather than as employees, with a pronounced desire to learn new skills and work in teams, yet act autonomously. They also seek security through compensation and flexibility, need recognition, status, personal development, and require a balance between work and leisure. Their orientation is toward flattened hierarchies, they tend not to trust in institutions, and are not employer-loyal; they offer respect only after it is earned. They are not concerned with prestige and respond best to a coaching leadership style (Jurkiewicz 2000). Millennials (also known as Gen Y) are believed to

prefer in-person contact although they have high levels of technological literacy. They view their work role as one of contractor rather than employee yet need career security through keeping skills updated; they are issue-focused and fluid across employers and sectors. They are confident and enjoy being challenged, and emphasize social good over leisure. Affluence is important to them and they earn money to spend it, rather than save; they do not place trust in the future. Reported characteristics about Gen Z include changing jobs often, creating multiple social media accounts and their personas online, and gender fluidity. They prefer interacting on media platforms rather than in person, and are socially and globally focused. They desire structure, collaboration, clear goals, rewards, and mentoring. They are concerned with the environment, climate change, and equality; they have a strong drive to contribute positively to society.

Testing these perceptions using an instrument that allows for symmetry across studies is the next step toward understanding generational ethics. This will allow for the development of proactive models to reverse the decline of ethicality over time in the USA (Jurkiewicz 2013a). Such models will not only provide a foundation for parents and other adult value-influencers but also to guide content in ethics education across the sectors. The effectiveness of specific types of ethics education in reducing corruption has been demonstrated (Jurkiewicz 2020). Essentially, it demonstrates for students a critical thinking approach to translate values into action, and how to measure effectiveness in approving ethicality in both the short- and long-terms. Beyond the individual-level impact, individuals within a social and organizational network influence each others' value system, for better or worse (Jurkiewicz and Giacalone 2004). As leaders are the primary impact of how values are translated into ethical behavior in the workplace, ethics education at varying levels of higher education is essential to meet the goal of arresting corruption and widespread distrust. Beyond the espoused values, an objective examination of the impact of leader behaviors is required; subordinates learn values by what the leader does rather than

what s/he says. The values demonstrated by leaders unconsciously lead to unquestioned institutional practices, in turn defining acceptable behavior and limited individual ethical autonomy. The common belief that individuals instinctively know what is right and wrong, and then can effectively employ that judgment, has no basis in fact (Jurkiewicz 2002c). The first step to reverse this ethics engine is to understand if generational value sets are objectively measurable, and then how to implement what we know actually works in terms of values education. Once the theory and processes are in place, it is easier to both predict and respond to the imposition of environmental events on values development.

### Effects of COVID-19 on Value Change

The onset of COVID-19 infections in the USA, arguably in January 2020, has dramatically shifted individual lifestyles, the amount of time spent with others or alone, and exposure to media and experiences. At the time of press, the USA is amidst a growth in infection and death rate, a 38.6% unemployment rate, and nearly 100% closures of schools and universities. Food shortages are rampant with over 40% of families with children experiencing food insecurity due to COVID-19; at the same time, farmers are forced to destroy crops and feed animals (U.S. Census Bureau 2019). Nearly every reliable news source warns it will get worse.

What effect a pandemic has on value development is a topic not represented in the literature, and one that will be an important avenue of study once the world has moved past the current crisis. What effect sequestering with specific groups of people over a long period will have is another key question with regards to value development in children; tangential research in related areas suggests it could have deleterious or beneficial effects depending upon the value systems and psychological sturdiness of those with whom they sequester (e.g., Jurkiewicz and Giacalone 2017). Perhaps they will develop values similar to those associated with Matures who grew up in the Great Depression, such as exhibiting employer loyalty,

job security, income generation, and social conformity. Or perhaps not. The growing distrust in others, government, and organizations among members of each successive generation is pronounced, from 19% of Matures, 31% of Boomers, 39% of Millennials, to 46% of Gen Z (Jurkiewicz 2020). Gen Z views others as selfish and exploitative, and unlikely to respect others. Given the patterns of trust in institutions over time, it is likely the impact of COVID will contribute to a further decline in trust (Jurkiewicz and Grossman 2012). One thing that is certain is that the generation following Gen Z, not yet tagged with a moniker, will carry the imprint of the pandemic on their value systems.

On a more uplifting note, the experience of sequestering with one's family affords parents the time to teach and demonstrate the importance of values, and what values are most desirable; of these two, demonstrating values through the adults' behaviors will have the greater impact (Jurkiewicz 2002b). How the parent and other adults forced to isolate together adapt to and protect the child from the impact of the pandemic will have a lasting imprint upon the psychological development of the child and their emergent value systems (Jurkiewicz and Giacalone 2004). The longer the period of isolation, the more pronounced the impact, positive or negative.

## Implications and Conclusion

A number of key next steps have been outlined above. Updates to the age cohort of generations needs to be investigated given the shifts in population and education and their impact on biological reproduction. Research employing the Rokeach Value Survey needs to be extended across all generations and used in both cross-sectional and longitudinal studies to determine if the assumed values for each group are those in operation. The language in the Rokeach Survey needs to be examined for change in meaning over time, and whether tweaks be needed to implement those and establish new reliability and validity measures. With increasing diversity and globalization, the accuracy of the generational

assumptions across varying cultures both across geographical boundaries and ethnic groups with the USA should be examined. Variables that affect the translation of values to ethics to behavior would benefit from greater clarity. Finally, the impact of the COVID-19 pandemic on value systems, ethicality, and work ethic are of critical importance. Given the importance of value constructs, more resources are required to more fully understand their development and impact.

## Agency Theory

Greg Shailer

Research School of Accounting, The Australian National University, Canberra, ACT, Australia

## Synonyms

Agency costs; Agency dilemma; Agency problem; Agency risk; Principal-agent problem

## Definition

Agency theory is concerned with problems that arise where one party (the agent) is expected to act

in the interests of another party (the principal), but the agent's own interests may conflict with the principal's interests, and the principal cannot fully monitor and discipline the agent. Agency theory is widely referenced in business, economics, and political science, where it is often identified as the "principal-agent problem." In business applications, the emphasis is usually on "agency costs," which are the costs borne by either the agent or the principal as a consequence of agency problems.

## Discussion

Agency problems arising from **conflicts of interests** between the principal and agent are greatest under **information asymmetry**. Here, the relevant form of information asymmetry is where the agent has more information than the principal regarding opportunities or the agent's intentions and actions that are pertinent to the principal's interests. If the principal is not fully aware of the agent's intentions or actions or is constrained by resources from acquiring the information, then the principal cannot directly monitor the agent's behavior and ensure the agent is always acting in the principal's best interest.

An agent's incentives to act counter to the best interests of the principal may be a consequence of the agent's inherent personal preferences (e.g., not working sufficiently hard or favoring the interests of other related parties) or adverse incentives such as those arising from bribes, commissions, or poorly structured reward schemes.

In business ethics, irrespective of whether the principal-agent relationship is implied or expressed through a formal contract, it is assumed the agent has a fiduciary duty to the principal. In corporations, directors and other officers of the corporation have a fiduciary duty to the corporation that is usually expressed in statutes or legal codes. The legal treatment of relationships between managers and other stakeholders in the corporation, including shareholders, is more variable. While there may be differences between jurisdictions as to the legal nature and enforceability of the fiduciary duties attaching to an agent, the ethical dimensions and implications of the

relationship, such as those pertaining to trust, stewardship, and accountability, may be more generalizable across jurisdictions and markets.

Agency theory is often the source of central tenets in issues concerning **corporate governance**. In this regard, the most common application of agency theory in relation to business and professional activities pertains to the relationship between corporate management (as agents) and shareholders (as principals). This is particularly evident in the accounting and finance literature, where "corporate management" refers to both directors and executives. The most cited reference in the development of agency theory in the corporate governance context is Jensen and Meckling (1976). This work is informed by problems described in Berle and Means (1932), but the recognition of the agency problem in corporations is much older; Adam Smith discusses concerns about corporate managers (as economic agents who are mere self-interested individuals) in *The Wealth of Nations*, which was first published in 1776, but it is likely that the relevant ideas were not originated by Smith.

Applications of agency theory in relation to corporate governance are typically focused on shareholders' interests in the corporation, as represented in the valuation of equity (variously called shares or stock) in the corporation. A major concern in this regard is that, if managers can profit from changes in share prices, the managers have incentives to misrepresent corporate performance or opportunistically manipulate the timing of the release of good and bad news to the market. This may mislead external investors as to the value of the corporation at various points in time in ways that enrich the managers. For example, when executive remuneration (also referred to as executive compensation) includes equity options in the corporation, the executives might obtain financial gains by manipulating the reported performance of the corporation. In this context, an equity option is the right to buy a share in the corporation at a predetermined "exercise price." This creates an incentive for the prospective option holder to temporarily depress the share price, prior to the option award date, to lower the exercise price of the options. When the share price later recovers, the option holder profits by the

difference between the option exercise price and the current market price of the shares.

More generally, central issues addressed in agency theory include agent effort, risk tolerance, and expropriation. These are not limited to the corporate governance context, as demonstrated by some of the examples below.

*Agent effort:* If an agent's effort is not fully observable by the principal, and there are not adequate compensating monitoring mechanism or performance incentives, the agent may enjoy more leisure or less stress by not providing sufficient appropriate effort to protect or serve the principal's interests. For example:

- Managers may spend less effort (shirking) on protecting or serving corporate interests than they would if their actions were fully observable or if their remuneration contracts were more appropriately structured.
- Managers may direct corporate assets to non-productive uses that provide utility to managers from the overconsumption of perquisites (or perks), such as extravagant offices, luxury motor vehicles, and superfluous travel and entertainment expenditures.
- An employee may engage in private activities during work hours without the employer's agreement.
- Lessees that are usually responsible for safeguarding leased assets have less interest in protecting and maintaining the assets than the legal owner.

*Risk tolerance:* In situations where an agent utilizes the resources of a principal, the agent may incur little to no downside risk because all losses are the burden of the principal, but the agent benefits more from upside risks through performance bonuses. This is seen when shareholders bear the residual risks by providing financial capital that corporate managers use at their discretion. Managers may exhibit a risk tolerance that differs from the shareholders' risk tolerances because of the uneven distribution of risk. This agency problem is a manifestation of **moral hazard**. Conversely, a consequence known as the "agency cost of debt" emerges when the cost of debt

increases because management engages in projects or behaviors that benefit shareholders more than bondholders, for example, taking on riskier projects that offer a high payoff may benefit shareholders but the higher risk the probability of default on debt obligations.

*Expropriation:* In the context of principal-agent problems, expropriation occurs when an agent transfers or diverts wealth from the principal to another party that the agent wishes to benefit (this can include the agent and related parties). This includes the cases identified below in relation to controlling shareholders. Other examples include:

- A manager purchases (sells) an asset at an inflated (deflated) price from (to) a party in which the manager has a vested interest. This is direct expropriation.
- Financial planners are expected to act in the best interests of clients but may have financial inducements to recommend products that are not best suited to the client's risk and return preferences. Although indirect, this can be regarded as expropriation because the agent is enriched by their actions but at the client's expense.

Applications of agency theory in corporate contexts also include problems where the preferences of individual shareholders differ from the best interests of the corporation as an entity and where interests can differ between shareholders. These may have the ethical implications for the actions of either shareholders or managers. For example:

- A shareholder's short-term liquidity needs may be best served by high dividend distributions that can reduce the corporation's ability to invest in profitable opportunities or create liquidity problems for the corporation, thus adversely affecting the value of the corporation (conflicting with the interests of some other shareholders) or the future survival or growth of the corporation. This conflicts with the interests of the corporation as an entity and may conflict with the interests of other shareholders.

- Some corporations have controlling shareholders and minority shareholders. Controlling shareholders can usually determine board membership and thus appoint executives and influence management decisions. Through these means, controlling shareholders can act against the interests of the corporation as an entity or against the interests of other shareholders. For example, a controlling shareholder might use their power to have family members appointed to managerial positions when they are not the best choices for such roles (**nepotism**), facilitate the **expropriation** of corporate assets, or cause the corporation to invest in projects that enrich the controlling shareholder or related parties but which are not the best investment options in terms of corporate value (a form of expropriation known as tunneling).

Because potential agency problems create uncertainty for principals as to agents' behaviors, market forces (including those in capital markets, managerial labor markets, and product markets) may provide incentives for the principals and agents to agree to monitoring arrangements designed to reduce that uncertainty. If markets fail in this regard, there may be regulatory responses intended to reduce the uncertainty if it is perceived by regulators that this is in the public interest. This is the basis for many regulations that are associated with information asymmetry, including restrictions on "insider trading" of shares, and corporate disclosure requirements and related **audit and assurance** requirements.

The regulation of corporate financial reports to shareholders is intended to reduce the information asymmetry problem by requiring management to report on their financial performance and stewardship. Requirements for independent audits of those reports are intended to reduce the uncertainty that attaches to the corporate financial reports, which are prepared and presented by management. The multilateral relationships between managers, shareholders, the corporation, and auditors give rise to a complex set of agency issues. In most jurisdictions, the auditor is effectively chosen by management; in jurisdictions requiring shareholder ratification, the auditor

selection process and contract negotiation are nonetheless controlled by the board of directors (or its equivalent). The auditor has contractual and statutory obligations to the corporation and its shareholders but is chosen by directors who oversee the auditor's contractual and remuneration arrangements. In addition, the auditor engages closely with corporate employees, including executives, in the conduct of the audit. The processes for selecting and remunerating auditors, and their working relationships with officers and employees of the corporation, are threats to **auditor independence**, which is fundamental to their role in alleviating the uncertainties attaching to the corporate financial reports provided by management. This concern receives substantial attention in the codes or standards concerned with the ethical conduct of auditors.

## Summary

Applications of agency theory are broadly concerned with economic consequences and contracting behavior that are examined in the context of rational expectations. The ethical implications of agency theory are largely concerned with agents' breaches of their duties to principals. Agency theory informs many discussions and debates in business and professional ethics and has substantially influenced developments in corporate regulation.

## Aggressive Tax Avoidance and Business Ethics

Hansrudi Lenz

University of Würzburg, Würzburg, Germany

### Synonyms

Aggressive tax minimization; Aggressive tax planning

### Introduction

In a purely economic view, corporate taxes reduce the profit that can be distributed to shareholders. Insofar as the owners of the company and the managers who run the company on its behalf pursue profit maximization, measures are implemented that maximize the present value of cash flows after taxes considering legal and reputational risks. Strategic and operational business decisions are made taking into account their tax consequences; for existing investment and production programs, opportunities are sought to represent them for tax purposes or to exercise tax options in such a way that tax payments are minimized. It is generally assumed that the owners or management comply with the relevant legal framework, i.e., do not deliberately violate legal regulations in order to increase profits.

For both empirical and normative purposes, it is helpful to define different forms of tax minimization or tax avoidance to distinguish the term “aggressive tax avoidance” from other modes of tax avoidance. For empirical purposes, a purely quantitative definition of the extent of tax avoidance measured by the effective tax rate is usually sufficient. However, for a qualitative case-by-case analysis or a normative analysis, a more substantively precise definition is needed that addresses the motivations and instruments behind the tax planning action.

## Aggressive Tax Avoidance and Other Forms of Tax Avoidance

*Aggressive tax avoidance* is defined as the artificial (non-genuine) arrangement of transactions undertaken predominantly by rational agents with the objective of tax optimization, leaving the actual value creation process of the involved economic entities, i.e., the economic substance, essentially unchanged. In interpreting tax laws, the letter of the law dominates over the law’s democratically legitimized intent or spirit (see for the following Lenz 2020).

If aggressive tax avoidance steps over the line, which marks the boundary of tax laws, such a behavior is called *abusive tax avoidance*. Many tax jurisdictions contain General Anti-Abuse Rules (GAAR); see for a recent example the European GAAR in Article 6, Paragraphs 1 and 2, of the EU Council Directive 2016/1164, which explicitly requires that the purpose of such a tax arrangement is contrary to the spirit or purpose of the respective tax law. Moreover, abusive tax avoidance is illegal, i.e., the tax declaration is not recognized by the tax authorities, and therefore the desired tax consequences do not occur. Still, such tax planning behavior is regularly not a criminal offence.

In contrast, *responsible tax avoidance* or *tax compliance* considers the intent and economic substance required by the respective tax laws in a specific jurisdiction. Therefore, such a tax planning behavior is perfectly legal and operates within the letter and the spirit of the tax laws. On the opposite side, *tax evasion*, i.e., illicit, deceptive, and fraudulent behavior, violates the letter and spirit of the law and may be punished by imprisonment in severe cases.

So far, tax avoidance and tax evasion have been distinguished according to their respective degrees of legality. However, there is also an increasing debate in the public sphere and subsequently in the business ethics literature about how the various forms of tax avoidance are to be evaluated according to *ethical criteria*. First, this can be investigated purely by empirical-explicative means: What are the criteria by which people morally judge corporate taxpaying behavior, and

what are the reasons and consequences of such behavior? Second, normative questions can be asked: Are there any reasonable and justified philosophical arguments for judging certain forms of tax avoidance as socially undesirable? The empirical and normative dimensions in a business ethics analysis of tax avoidance must be strictly distinguished because no normative judgments follow from purely empirical research. For example, according to Hume, it is not possible to derive an “Ought” from an “Is,” i.e., to argue the group tax rate of Apple Inc. in its consolidated statement for the fiscal year 2019 is only 13%, and that is morally wrong and, therefore, should be prevented.

### **Empirical Observations: Large Multinational Companies as Tax Avoiders**

Several studies show that huge multinational companies (MNCs) use their profit-shifting opportunities to avoid taxes. Based on macroeconomic data, Torslov et al. (2021; see also for details and data <https://missingprofits.world>) assessed in a cross-country analysis that 36% of MNCs’ profits were shifted to low-tax countries in 2015. Commonly adopted modes of profit shifting are transfer mispricing, location of intellectual property in low-tax countries, international debt shifting, tax deferrals, and preferential advanced tax-rulings. A meta-analysis shows that the tax sensitivity of MNCs reported profits to tax rates are high: A one-percentage-point higher corporate tax rate will decrease the reported profits of an MNC subsidiary by 1% (cf. Beer et al. 2020). Thus, it can be concluded that tax avoidance by MNC is a fact.

### **The Normative Evaluation of Tax Avoidance and Tax Evasion**

Because the obligation to pay taxes is laid down in tax laws, the ethical assessment of corporate tax-paying behavior is closely linked to general statements about the interpretation of and compliance

with regulations (duty to obey the law). In principle, all forms of tax avoidance and evasion could be subject to ethical evaluation. From a business ethics perspective, it is *prima facie* undisputed that responsible tax avoidance in a democratically legitimate state is morally unobjectionable, and tax evasion is mainly seen as not only illegal but also ethically reprehensible. Responsible tax avoidance is acceptable, among other reasons, because the state often grants explicit tax advantages to steer investments in a specific direction. For example, the state desires the use of tax reduction opportunities by companies to achieve allocation targets, i.e., more investments into green technologies.

On the other hand, tax evasion is not only illegal but also ethically reprehensible because the tax-collecting state is deliberately deceived, and ethical approaches will generally evaluate fraudulent actions as morally wrong. The whole argumentation so far is based on the equation “illegal = illegitimate,” but this is only valid if the tax laws themselves can be morally justified, i.e., they are part of a democratic, liberal, and at the same time fair and just tax system. Even in well-functioning democracies, the tax system can be deemed unjust, and in corrupt and criminal states, there can be good philosophical reasons to evade taxes (cf. McGee 2012).

However, the central normative ethical problem predominantly discussed in the literature lies in evaluating aggressive or abusive tax avoidance practices. Thus, consequentialist (utilitarian), deontological, or virtue ethical approaches are mainly used for justification purposes (cf. Scarpa and Signori 2020).

### **Utilitarian Evaluation**

Utilitarianism is the best-established form of consequentialist ethics. In consequentialism, the moral evaluation of action depends exclusively on assessing the consequences of this action for the concerned stakeholders. A utilitarian analysis actually requires a quantitative assessment of the benefits and costs of aggressive versus responsible tax avoidance for stakeholder groups, i.e.,

government, management, shareholders, creditors, employees, and so on. The sum of utility and disutility must be calculated for each stakeholder group and summed up. From an economic perspective, corporate taxes are borne by individuals, not by the artificial legal entity of the company; this is shown theoretically and empirically by tax incidence studies. Therefore, tax avoidance may benefit shareholders via share price increases, employees via higher wages, and consumers via lower product prices. These benefits must be offset against the cost of foregone taxes. A utilitarian analysis must solve many intricate problems: (i) defining the concerned stakeholders; (ii) predicting the consequences of tax avoidance; (iii) measuring of benefits and costs requires knowledge of the preferences of the people affected; (iv) ensuring that maximizing utility does not lead to unacceptable inequalities in society. According to their own assessment, Payne and Raiborn (2018) give only a rough qualitative estimate of the positive and negative effects of aggressive tax avoidance.

## Deontological Evaluation

In deontological ethics, acts per se are characterized as dutiful (right) or non-dutiful (wrong) regardless of their non-moral consequences, which are not directly part of the description of the act; they are thus commanded or forbidden relative to a justified moral imperative. The ethical evaluation depends on specific act characteristics, not primarily on consequences. The best-known form of deontological ethics is Immanuel Kant's ethics of duty, in which moral obligations are justified with the help of the Categorical Imperative (CI, *universal law of nature formula*) as a formal test procedure: "so act as if the maxim of your action were to become by your will a universal law of nature" (Kant 1786/2012, p. 34). Concerning tax avoidance, the central normative question in this approach will be: Is aggressive tax avoidance as a maxim of action in tax planning situations conceivable, or can it be willed as a maxim of action applicable to all in the society (cf. for details Lenz 2020). If the strong

universalization of this maxim leads to a contradiction in conception or will, the action is prohibited; otherwise, it is permitted. A contradiction in conception arises if a world with widespread, pervasive tax avoidance practices is inconceivable because such a practice would destroy the tax system and the rule of law; acting according to the generalized maxim is then no longer possible. A contradiction in the will results when people do not want to live in a world in which all act according to this maxim.

The following example demonstrates the Kantian procedure for a *contradiction in conception test* in four steps (cf. Lenz 2020):

### Step 1:

The formulation of the maxim (from purposes and a hypothetical imperative): In type S situations (= a relevant and applicable legal norm with interpretation opportunities exists), I will do act A (= *abusive or aggressive legal interpretation*, e.g., of tax laws) to achieve objective O<sub>1</sub> (= personal advantages, e.g., minimization of taxes), and I wish to simultaneously pursue objective O<sub>2</sub> (= use of a tax-financed stable, predictable, easy to administer and just legal system).

### Step 2:

The formulation of the corresponding (natural) universal law: Of necessity, every person who pursues objectives O<sub>1</sub> and O<sub>2</sub> undertakes act A in situations of type S.

### Step 3:

Does a practical contradiction in conception arise if one wants the maxim to be a general (natural) law?

### Step 4:

If the previous step results in a practical contradiction, act A (= abusive or aggressive legal interpretation, e.g., of tax laws) corresponding to the maxim would be prohibited; otherwise, it would be allowed.

In decisive step 3, a world is imagined in which all – adverse parties, judges, civil servants, lawyers, tax consultants, financial statement auditors, tax auditors – use abusive and aggressive legal interpretations. This could lead to a practical

contradiction in conception, because the presumed concept of a fair and just system of law (purpose O<sub>2</sub>) would then be destroyed *at least in the abusive case*, e.g., the institution of the rule of law (including letter and spirit) would be endangered.

The group of deontological ethics also includes Rawls’ contractarian approach. Rawls’ (2001) conception is predominantly part of political philosophy; its primary purpose is to establish the principles of a free, liberal, and just society. This includes the difference principle: inequalities in a society are only justified if they improve the position of the least advantaged. A fair tax system can contribute significantly to this. Rawls (2001, p. 160 et seq.) himself makes only parsimonious remarks about fair taxation; even a purely consumption-based tax system can also be designed to be fair. Moral psychology stabilizes such a system based on reason: If institutions, e.g., the tax system, are perceived as just or fair, people are willing to contribute and develop trust provided that free riders are sanctioned appropriately. This results in sound “tax morale (tax compliance),” which supports and stabilizes the system (cf. Alm and Torgler 2011). On the other hand, tax morale can erode if taxpayers feel that too many individuals and companies are abusing the system through aggressive tax avoidance.

Virtue Ethics

Virtue ethics approaches emphasize forming and strengthening a person’s character, which should contribute to a meaningful and flourishing life within a cooperative society. Virtues are character traits acquired by education and habit formation that contribute to the success of communities. Following the Aristotelian tradition, they try to identify and justify personal qualities that serve this purpose. The approach is beneficial because it focuses on the individuals acting on behalf of the companies, the tax practitioners, and tax advisers. Concerning tax avoidance, the central normative question in this approach is: what virtues should tax practitioners and tax advisors have? Candidates for such excellent virtues are courage, justice, honesty, and integrity (cf. West 2018). For example, a virtuous tax advisor could ask: Is a particular tax avoidance scheme based on a balanced, fair interpretation of the tax laws considering their letter and spirit, and do the tax authorities have all the necessary information to assess it appropriately?

Conclusion

The major ethical approaches discussed in the literature on tax avoidance, their normative

| Utilitarian               | Comparing utility for responsible, aggressive, and abusive tax avoidance for impacted stakeholders.              | Assessment of benefits and cost of responsible, abusive, and aggressive tax avoidance for different stakeholders.       |
| Deontology: Kantian       | Is aggressive or abusive tax avoidance permitted or prohibited under the Kantian Categorical Imperative test?    | What duties actually influenced decisions about whether to engage in responsible, aggressive, or abusive tax avoidance? |
| Deontology: Contractarian | Identification and justification of criteria for a just and fair tax system of a liberal and democratic society. | Reasons and consequences of real tax attitudes (tax morale) in different societies.                                     |
| Virtue Ethics             | Identification and justification of virtues for tax practitioners.                                               | Reasons and consequences of observable intellectual and moral character traits of tax practitioners.                    |

criteria or cores used, and the empirical questions they raise are summarized in Table 1.

For future tax avoidance research, it is fruitful to clarify open fundamental normative questions within and between ethical theories and, secondly, to keep normative and empirical analyses clearly separate but nevertheless connected. For example, this is necessary to determine the potential gaps between normative requirements and actual behavior.

## Aging and Ethics

Bernard McKenna

University of Queensland Business School,  
Brisbane, Australia

## Synonyms

Aged population; Ageism; Aging workforce; Elderly; Gerontophobia

## Introduction

The salience of ethics in relation to aging is more pronounced in advanced economies, particularly Western, for three reasons: the relative size of the aging population is increasing because of fewer births; longevity has increased and the vitality of the aged in terms of physical mobility and health has greatly improved; and financial security, largely because their working lives occurred predominantly in a period of sustained economic growth, has significantly increased. In fact, people aged over 65 – the category which previously implied old, retired, and in a process of physical and mental decay awaiting death – have now been re-categorized in the “young-old” and the “old-old” (those aged 85 and above). Four major ethical concerns emerge in relation to the contemporary phenomenon of aging: (1) an aging workforce, (2) the social contribution and cost of a large aged population, (3) the impact on government expenditure of increasing healthcare costs, and (4) end-of-life decisions. The first three are considered below, while the fourth requires an entirely different ethical debate.

While it is still largely true that there is greater respect for older people in non-Western countries, this varies in intensity among countries and regions and appears to be slowly declining as these more traditional countries are impacted by Western cultural mores.

## Ageism

Age becomes an ethical concern when some form of ageism occurs. Ageism is defined as casual or systematic stereotyping and/or discriminating against people on the basis of their age. At the lower end of the scale, prejudice manifests when people are prejudged or an opinion about them is formed before taking into account the facts and context of a case. Systematic bias, a second level of ageism, often occurs because of this prejudice by limiting people's potential to show their capability and thereby contradict cultural assumptions. Another level of ageism in practice is discrimination, which refers to actions denying or limiting rights and opportunities to people on the basis of age: an example of this is a compulsory retirement age. The most extreme form of ageism is elder abuse. This is defined by the World Health Organization as "a single or repeated act or lack of appropriate action, occurring within any relationship where there is an expectation of trust, which causes harm or distress to an older person." Studies indicate that elder abuse primarily manifests as psychological abuse and neglect. However, financial abuse and, to a lesser extent, physical abuse also occur. Psychological abuse, such as the lack of emotional warmth and care, and neglect are often not so much willful as the outcome of patterns of family organization and lack of respect or filial responsibility. As well as elder abuse, which largely happens within families or aged-care facilities, an extreme form of ageism is hostile prejudice, stereotyping older people in a hateful and aversive way, to the extent of gerontophobia, that is, hatred based on a fear of growing old.

## Ageing in the Workforce

The impact of aging on the workforce varies considerably across cultures. For example, Organisation for Economic Co-operation and Development (OECD) countries, regarded as representative of advanced economies, will experience a considerable aging of their workforce. Between 2000 and 2020, it was predicted that the number of people of pensionable age will have risen by 70 million while those of working age will have increased by about five million. It is also predicted that, in 2020, 25% of the US workforce will be 55 years or older – a phenomenon called The Silver Tsunami. The proportion of people over 65 is highest in Japan (26.3%), but in Europe it is also significantly high (e.g., Italy 22.4%; Germany 21.2%). The effect of aging on the workforce varies according to diverse factors such as a livable pension, the level of social security, and the demand for particular skill sets. Despite the potential demand for older workers to remain in the workforce, negative stereotyping continues to be a major obstacle. This negative stereotyping is deeply culturally engrained. This has been shown in word association tests where "old" is negatively associated with various traits.

According to the research by Gringart et al. (2013), the many characteristics of such stereotyping can be grouped in three domains – all based on an implicit or explicit comparison with younger people. The first domain is interpersonal. From a positive perspective, older people are seen as more reliable and harder working. However, negatively, they are considered as less cooperative, less willing to subordinate, and too cautious. The second domain, work performance, incorporates beliefs such as being less capable with new technology, more accident-prone, and indecisive. The third domain is not work specific but includes ageist misconceptions that older people are less healthy, less creative, less mentally alert, and less efficient. In contrast to these stereotypes, research by Roberts et al. (2006) on patterns of mean-level change in personality traits across the life course shows a different story. The "Big Five" trait of agreeableness appears to spike upward from around age 45 and then continues with slight increments from 55. The trait of conscientiousness rises

dramatically from age 20 and continues to rise strongly to age 65 before plateauing. Moreover, optimum levels of emotional stability from 55 to 65 suggest the potential for positive organizational cultural influence of older workers. However, the stereotype is partly supported by a slight decline in openness to experience from about age 60, although this may be due to diminishing social circles with retirement, children's departure from the home, and deaths of friends and family.

The main ethical concern in appointing or retaining older people in the workforce appears to relate to stereotypical attitudes and beliefs held by employers and fellow employees.

### **Social Contribution and Cost of an Aged Population**

With older people's withdrawal from paid employment, an attitude concerning their lack of usefulness to society can implicitly emerge. Yet there is good evidence that older people contribute significantly to social capital understood as relationships that contribute to the number and quality of social ties, which in turn contribute to trust, reciprocity, and community benefit. It is true that as people age, and particularly as they reach the "old-old" category, they are likely to be more dependent on their adult children for support. However, this varies considerably with the socioeconomic status of the older person, ethnicity, cultural norms of obligation, and family situation (e.g., divorce or spousal death).

Despite the growth of aged care facilities and families' geographical dispersion, many older people express a preference to age in their own home. Allowing this to happen does involve ethical decisions by families, communities, and governments because with increasing physical frailty, greater levels of in-home support will be needed to ensure medical directives and appropriate nutrition are maintained as well as to provide assistive technologies. This comes at a price that is funded by taxpayers. Within a neoliberal political economy of low taxes and low government expenditure, there is a high likelihood that sufficient levels of care for in-home aging cannot be maintained,

thus raising political-ethical concerns. Diametric to in-home aging is the retired persons' gated community which restricts entry to particular types of people, mostly by age, but very likely (and implicitly) by ethnicity and socioeconomic status. According to Blakely and Snyder's (1997) *Fortress America*, these communities can produce a sense of collective citizenship and provide salubrious spaces and activities. Yet the ethical question of reverse discrimination by older people arises, and the social question of the potential loss of wider community diversity is also a consideration.

### **Impact of Increasing Healthcare Costs on Government Expenditure**

It is incontestable that, collectively, as people age they acquire more illness, disease, and/or disabilities. For example, in a developed economy like Australia, with a universal healthcare and subsidized pharmaceuticals, older people living in households have been found to have significant levels of medical conditions: almost half had an arthritic condition, about 40% had hypertensive disease (38%), 22% had heart and vascular diseases and stroke, 15% had diabetes, 7% had cancer, 10% had potentially disabling age-related vision problems, and 35% had hearing loss. About 93% of dementia cases occurred in the over 65 age group. Forty-nine percent of people aged 65–74 had five or more long-term health conditions, increasing to 70% of those aged 85 and over. Not only will the number of older people with these conditions increase, but there also may be increases in expectations about the standard of health services. As older people will comprise a growing proportion of the voting public, it is possible that they can skew already limited welfare spending toward them. For example, 60% of the public healthcare cost was spent on 15% of the European population aged 65 and over as their healthcare costs are three to five times higher than for those under 65.

There is a growing sense of intergenerational injustice favoring the older population in developed countries. The evidence about this is mixed and fairly difficult to determine because, among other factors, older people may not necessarily vote for

their own age group's interests but for fiscally conservative or pro-environment parties, for example. Research by Tepe and Vanhuysse (2010) shows that the countries most heavily biased toward the elderly in public policy spending are the USA, Japan, Switzerland, Austria, and all Southern European welfare regimes. On the other hand, Scandinavian and Anglo-Saxon countries (except USA) had the least pro-elderly regimes. Complicating the picture further are the changing structures of government policy in the "post-welfare" era and the emergence of more recent social phenomena such as women in full-time career-based employment. Another complicating factor is the political psyche of those aged 45 and under. These are people who grew in an age where neoliberalism replaced the welfare state as the prevailing political ideology – thus becoming more cognitively constrained (as suggested by Goerres and Vanhuysse 2011), namely, that they may have more limited expectations of what a state could or should provide.

Community decisions about where to spend the shrinking social welfare budget present ethical problems at both individual and government level. For example, should those who lived in a time of increasing GDP/head and relatively full employment be expected to have shown sufficient responsibility to fund their own retirement? Would this even have been possible considering the amount needed to be set aside each year of one's working life? Should the social norm or expectation of governments providing retirement income and health benefits, which existed until the 1990s, be retrospectively changed? While these are concerns about our current aged population, the question will be one faced by those who are currently 45 or younger. The average rise in life expectancy at birth within OECD countries rose by 6 years between 1983 and 2008 to an average of 79.3 years (with Japan highest at 82.7). Notably, the USA (77.9) is below the OECD life expectancy average.

Related to this concern is the cost of maintaining life, particularly in cases of extended morbidity (such as Alzheimer's disease) and terminal disease. Given the capability of modern medical technology to sustain life beyond what was formerly possible, several ethical questions emerge.

The most obvious question is to define life and death. However, from a business perspective, a major concern is the extent to which the state has a responsibility to use taxpayer money for expensive treatments and hospitalization to maintain life, particularly in terminal cases.

Not only is this a state responsibility in terms of legislation regarding end-of-life decisions, but it is also likely to be played out in thousands of individual situations where families will need to make decisions where the boundary conditions will be strongly determined by the policies of public and private hospitals and the families' financial status. While private hospitals may have the legal right to exclude or terminate entry to extended end-of-life treatment, public hospitals will most likely not have that option. Consequently, thousands of private anguished decisions will ultimately have a public impact. An Australian study found that care of people aged 65 years and over in their last year of life represented almost 9% of all hospital inpatient costs (Kardamanidis et al. 2007). Paradoxically, hospital costs fell with age (in the 65 and over age group): people aged 95 years or over cost less than half the average costs per person of those who died aged 65–74 years (AUD 7028 versus AUD 17927). Costs rise almost nine times from 6 months prior to death (AUD 646 per person per day) to the last month of life (AUD 5545 per person per day). Costs also vary by disease (e.g., cardiovascular diseases cost AUD 11069 in inpatient costs while genitourinary system diseases cost AUD 18948). Given the capacity for hospitals and insurance companies to determine likely costs for different medical conditions, it is plausible that some private hospitals may choose to exclude certain types of patients according to their disease type.

## Benevolent Prejudice

A borderline ethical issue related to age-based prejudice is benevolent prejudice, which occurs when older people are pitied or patronized because they are seen as incompetent or deficient. Although often well-intentioned, benevolent prejudice is nonetheless founded on stereotypes and produces

feelings of disrespect and diminution in older people. Typical of such behavior is speech overaccommodation when younger people, often carers, talk to older people. This is characterized by speaking more loudly and more slowly, with excessive politeness and intonation, and using simple sentences (baby talk). At a more serious level is the tendency to withhold information or the expression of serious thoughts and feelings for fear of upsetting the older person.

## Possible Futures

While aging brings physical decrements, it is also clear that, with the emergence of the concept of the young-old in particular, aging people have much to offer to organizations as paid workers or volunteers and to society in general. For example, a characteristic of older people is generativity (first identified by Erikson 1950), namely, a personal inner desire to support the next generation based on the motivation of a conscious concern for their welfare. This characteristic is associated with belief in human goodness, according to researchers McAdams and De St Aubin (1992). It is also known that older people are capable of better moral reasoning than younger people. By allowing this generative desire to be expressed, organizations and society can provide experience-based knowledge to assist younger and less experienced people in dealing with difficult situations.

Changing family and work structures as well as geographic mobility leads to increasing disconnections between children and their grandparents. Despite the increasing longevity of grandparents, the potential for older people to develop strong relationships with their grandchildren may be limited by social class. Evidence shows that children from the most advantaged families are most likely to access this valuable grandparent resource. On the other hand, children in single-parent families and those with less educated mothers will be far less likely to access their grandparents. Not only is this an indirect social deficit for the child, but it also contributes to the social alienation of older people.

In each of these cases we see the problem that underpins the ethical concerns about ageism listed

at the start, namely, that of inaccurate and unfair perceptions and evaluations of older people. Thus, developing more ethical approaches to the aged might well be assisted by challenging the often implicit assumptions that we hold about aging. At the same time, particularly as greater numbers of older people move into the old-old category, these more localized and interpersonal problems of aging will most likely spread to the public sphere forcing governments and those who vote for them to make significant decisions, some of them deeply existential, about caring for the infirm aged and about where the boundary of life ends.

## AI and Corporate Responsibility

### *How and Why Firms Are Responsible for AI*

Kirsten Martin<sup>1</sup> and Carolina Villegas-Galaviz<sup>1,2</sup>

<sup>1</sup>University of Notre Dame, Notre Dame, IN, USA

<sup>2</sup>Universidad Pontificia Comillas, Madrid, Comunidad de Madrid, Spain

### Synonyms

AI; Artificial intelligence; Big data; Technology

### Introduction

When companies develop and use technology, who is responsible for the moral implications design during development and impacting stakeholders during use can be contested. This entry explains how we think about corporate responsibility around the design, development, and use of AI.

### AI and Corporate Responsibility

When a firm develops an AI program, that firm makes value-laden decisions as to who is important, who should be considered, and who can be ignored in a given decision. For example, in a mortgage approval program, the computer scientists train the algorithm on previous applicants including who was approved and rejected over a number of years. The AI program “learns” the

attributes of individuals who are more likely to be approved. In any given data set, some people will be well-represented with all the data filled out and some will not have all their data included. Some types of people will be completely missing from the data. Data and computer scientists need to decide how much to punish people who are not represented or not well represented in the data. In addition, these same data and computer scientists make assumptions about missing data, how to treat outliers or edge cases, and how morally important it is to include more people in the model. In other words, if the predictive mortgage approval model does work well with certain people, should we care? Does it matter? How much should a bank care?

All this is to say that the firms that develop AI programs make value-laden decisions during design and development (Martin 2019). And that these decisions have moral implications for the firms that adopt the AI program and the users who are subject to a particular AI program. This runs counter to the mistaken belief that AI is somehow neutral or operates outside human involvement. In fact, these data and computer scientists have to make value-laden decisions throughout the development process.

- *Training and Live Data.* When algorithms are developed from training data, who is represented in the training data and how the data is labeled directly impacts the creation of the algorithm. For example, when facial recognition is trained on primarily white men, the result is an algorithm who identifies white men moderately well but identifies black women incorrectly the majority of the time (Buolamwini and Gebru 2018). The model that is developed on a specific training data set may also be tailored to that training data and ineffective when applied to live data, causing harms, breaking rules, and reinforcing existing power dynamics.
- *Development of the Model.* Computer scientists make assumptions about the type of data, how the data is distributed, whether data is missing (and how bad is it for data to be

missing), and whether the algorithm should care about outliers (and how much should it care). These are all value-laden decisions about individuals.

- *Outcome Chosen.* How does a particular outcome favor certain groups of people and how well does the outcome represent the phenomenon of interest? For example, we use GPA as a measurement for “good student in college” sometimes, but that does not mean that the GPA as an outcome is a good measurement of the phenomena we are interested in.
- *Mistakes.* All AI programs generate mistakes – people are mischaracterized and misidentified. Sometimes AI predicts someone will commit a crime and they do not, which is a false positive. Other times AI programs will predict someone will not commit a crime and they do which is a false negative. The types of mistakes (false positives versus false negatives) vary across decision contexts as well as which mistakes are more preferable for a given decision. For example, in the criminal justice system, we *prefer* false negatives: we prefer in the United States that someone be falsely set free rather than falsely imprisoned. Not only do computer scientists influence that types of mistakes that are more common with a given AI program, but they also influence whether or not the inevitable mistakes are able to be identified, judged, and fixed by users of the AI program. AI programs that are developed to be inscrutable, e.g., declared proprietary or designed to not be accessible by the firm that uses the AI program, allow the inevitable mistakes to continue by not allowing users to identify, judge, possibly fix mistakes.
- *Contestability.* While people like to think that AI and related computer programming approaches are inscrutable, computer scientist Joshua Kroll notes that “inscrutability is not a result of technical complexity but rather of power dynamics in the choice of how to use those tools” (Kroll 2018). In other words, making a program difficult to use or making the mistakes created by the program difficult to identify, judge, and correct is a design decision.

In fact, developers of AI programs should make their programs contestable (Mulligan et al. 2020), where subjects of the AI program are able to contest any decision made about them. This would require a certain amount of transparency and accountability in the design depending on the context of the decision and the types of users subjected to the program.

- *Assessment of AI.* The computer scientist influences how the AI program is assessed that it “works.” While we regularly, in the popular press and in academia, claim that AI is “accurate” or “efficient,” these measurements are actually constructed in the design for many programs. For example, one might need to know for whom is the program accurate and for whom is it not accurate. And, the efficiency gains for a company implementing AI programs may also mean that a bad decision is being made faster. We normally do not see mere efficiency as a goal for decision making. If we are hiring or arresting the wrong people, making those types of decisions faster with the aid of AI does not make the entire organization more efficient and may offload some of the work onto others. In fact, even the idea of prioritizing claims of accuracy and efficiency is a value-judgment that may work for the developing firm but not for the firm adopting and using the AI program.

### Why Firms Are Responsible for AI

While the data and computer scientists make value-laden decisions in developing the AI program, the firm that *uses* the program is responsible for the ethical implications of their business decision. In other words, the bank is still responsible for making mortgage decisions, insurance companies are still responsible for adjudicating insurance claims, and firms are still responsible for their hiring decisions *even if* they augment their decision with an AI program. This places a distance between the moral decisions of development and the ethical implications in use.

Hence, the introduction of AI to decision-making increases what scholarship has called moral distance. Scholars use this concept to

explain why individuals behave unethically towards those who are not seen. With AI decision-making, face-to-face interactions are minimized, and decisions are part of a more opaque process that humans do not always understand. Therefore, the issue regarding AI and moral distance is that firms miss the moral implications of their decision, for which they are responsible, being blinded behind the veil of AI (Villegas-Galaviz and Martin 2022).

Firms are responsible for the development, deployment, and use of AI in the same manner these same firms are responsible for the many business decisions they make about the products they develop, the materials they purchase, and the decisions about individuals that they make. Firms are responsible for the products and services they sell in that they have an obligation to not cause harm, act in a manner that does not further disadvantage the less fortunate, abide by the values and norms of society, and follow the law. Firms are similarly responsible for the decisions, augmented with AI, they make about individuals, employees, and users in that they have an obligation to treat people with dignity and respect, act as if individuals are an end and not a mere means to be used merely for the firms benefit, and to not create harm or diminish rights. The introduction of AI into an organization does not remove their responsibility for their actions.

### Approaches to Take Responsibility for AI

Our ethical concepts, traditions, theories, and approaches can be seen as a way to close the gap between those making value-laden decisions and the ethical implications of those same decisions. In other words, these theories and approaches help the data and computer scientists understand better the ethical implications of their work. And, for firms adopting AI, these approaches provide a roadmap of the types of questions one should ask about the design and development and use of a specific AI program. Here we focus on more than mere consequentialism, which would only ask firms to calculate the possible net benefits or harms caused by the development, deployment, and use of AI. Consequentialism has the same

deficits as an ethical tool when applied to AI decisions: the harms to the few who are considered marginalized, without a voice, or “edge” cases can be ignored in order to benefit the more powerful. Instead, we focus on those ethical approaches that would help firms take responsibility for AI and decrease the moral distance exacerbated by the use of AI.

#### 1. Deontology

In the field of AI and business ethics, much work has been done to find the right set of principles or AI ethical guidelines. Deontology, or principle-based ethics, bases the rightness of the action in that it follows the duty of those who act. Hence, individuals should decide according to their principles or rules rather than considering the consequences or context. These attempts within AI ethics usually follow the line to bring ethical frameworks from other disciplines, especially the four essential principles traditionally used in bioethics: beneficence, nonmaleficence, autonomy, and justice. However, scholars have brought out the fact that principles are not sufficient to guarantee ethical AI and the limitations of a principled approach to AI ethics (Mittelstadt 2019).

#### 2. Justice and Fairness

Fairness and AI has become almost synonymous with ethical AI, primarily when AI has been used to sort individuals, the program reinforces existing injustices captured in the data. For fairness and justice approaches to AI, initial works focused on how algorithmic decision-making processes do not lead to more objective and or more fair decisions than those by humans, who are seen as influenced by prejudice or emotions. In fact, AI has the potential to exacerbate issues regarding discrimination, bias, and fairness. In applying fairness approaches, best practice is to distinguish questions about discrimination and questions about justice. Fairness and justice theories highlight how being predicted or categorized should not be more likely for particular groups of people and that the system of

allocating goods (the AI program) should not harm the less fortunate. Other approaches focus on equity, parity merit, and even the appropriateness of using particular attributes of individuals for a decision (Martin 2019). Discrimination law, on the other hand, focuses on ensuring the individuals are not treated or impacted differently based solely on a protected attribute (nationality, race, ethnicity, sexual orientation, gender, religion, etc.), and problems of discrimination are best examined throughout the process of design, development, and use of AI (Barocas and Selbst 2016).

### 3. Virtue Ethics

Within virtue ethics approaches to understanding AI, the character traits of the agent or subject/user is the focus. Shannon Vallor's proposals lead the way to bring virtue ethics to answer the critical ethical questions of the current era. In her book *Technology and the Virtues* (2016), Vallor proposed a virtue-driven approach to the ethics of emerging technologies, such as AI, and a kind of ethical strategy for promoting the moral character needed for the challenges of recent times. In her framework, she adapted Aristotelian, Confucian, and Buddhist ethical reflections to create a set of what she calls are the *technomoral virtues* needed for the twenty-first century. The *technomoral virtues* framework is proposed to specify how humans should act to flourish in an uncertain future, where the uncertainty comes from the changing nature of emerging technologies. There, in search of a *technomoral wisdom*, the framework proposes an adaptation of 12 virtues to the new techno-social environment, in there are virtues like honesty, self-control, humility, or civility.

### 4. Ethics of Care

More recently, the ethics of care has been used to better understand the moral implications of AI. The ethics of care is a contextualized moral theory focuses on interdependent relationships, individuals' vulnerabilities, circumstances, and the voice of the other in ethical decision-making. In AI ethics, the

contribution of the ethics of care comes in line with the understanding of how AI models may marginalize those who do not fit within the pattern created and used by those who develop and deploy AI. In its critical aspects, the ethics of care can help in the comprehension of how algorithm decision-making can create harm and ignore the needs of individuals, especially the most marginalized groups (Villegas-Galaviz 2022).

### 5. Critical Approaches

Critical theories attempt to understand the power dynamics and seeks to question not only the presumed objectivity and neutrality of analytics (Johnson n.d.) but also the power dynamics at play in building the algorithm, collecting and using the data, and deploying AI and analytics. Critical approaches seek to understand who gains and who is marginalized by the status quo. Langdon Winner (1980) is perhaps the most well-known scholar to take this approach to technology more broadly. Winner argues that technology, designed and used by society, has politics or "arrangements of power and authority in human associations." In regards to AI, critical approaches examine the development and use of AI through the lens of power – who retains power and who is marginalized – and usually makes the case for the lifting or emancipation of those who are being undermined by the use of AI.

### Conclusion

When considering the ethical implications of development or use of AI to augment decisions, business practitioners and business ethics scholars have the tools to better understand how AI can be developed and used within the given values of the firm. AI does not fundamentally change how we think about ethics and responsibility.

## Alienation

Scott Grills

Brandon University, Brandon, MB, Canada

## Synonyms

Absence of control; Anomie; Exclusion; Isolation; Powerlessness

## Definition

Alienation refers to the *social* phenomenon where people are dominated by forces of their own creation, yet may fail to recognize their own authorship relative to institutions and processes at hand. The reification of these social constructs contributes to human alienation in all spheres of life. From a classical conflict perspective, alienation is to be found in all major institutions that comprise the superstructure of capitalist societies (e.g., religion, family, the state and state functions) and political economy. As Marx writes, “Objectification is the practice of alienation” (Marx in Bottomore 1963: 39).

## Description

Unlike more contemporary usages wherein alienation (and powerlessness and normlessness) are framed in more social psychological terms, classical conflict approaches to alienation frame the concept firmly in the relationship of people to their work and the extent to which they have control of the practice of work and the outcomes of their labors. Simply put, persons are alienated when they do not control how they work, what they produce, the value of what is produced, and its possible distribution. In this sense then, persons may define themselves as having a high quality of life and at the very same time be engaged in alienated labor. The perspective of the actor is less important within classical approaches than is the structure of work and the relationships of production.

There is a dialectical process in play here. Marx conceives of human actors as *Homo Faber* (human as the maker/worker/tool user). To be human is to work and by working is to gain some form of control over the state of nature, but at the same time, this work produces a history of the increasing alienation of humans from the natural world that their work attempts to control.<sup>1</sup> As alienation pertains to the world of work, there are four keys aspects of alienation identified in Marx's early

<sup>1</sup>For a discussion of this theme, see Tolman (1981).

writings: (1) alienation from the process of production, (2) alienation from the objects produced, (3) alienation from the self, and (4) alienation from the “species being” (or the community of others).<sup>2</sup>

Of alienated labor Marx writes, “Work is external to the worker . . . It is not part of [their] nature; consequently [they do not] not fulfill [themselves] in [their] work but deny [themselves]” (Marx in Bottomore 1963: 124). Marx frequently argues by analogy that the alienated worker is like a *homeless* person. But since we all seek to find *home* (a place where we can be who we are and find meaning and some form of comfort), the alienated worker seeks a home elsewhere – in leisure, in family, and in religion perhaps. While this may provide a home of sorts, it does nothing to resolve the homelessness of work itself. It is in this context that Marx’s famous rendering of religion as being the opiate of the masses is to be understood. For the church provides a home for those made homeless through alienated labor. Religion is not just analogous to an opiate, but it is also the *heart in a heartless world*.<sup>3</sup> Religion becomes a salve to the worker who experiences his/her “own activity as something alien, not belonging to (them), activity as suffering, (and) strength as powerlessness” (Marx in Bottomore 1963: 126).

The message here for contemporary professionals and managers is not a cheery one. The relations of the means of production that are endemic to modern capitalism are inherently problematic. That is, they treat the other as a means to an end (e.g., surplus value), and alienated labor is the very real-life manifestation of relations within the workplace. As Coser (1971: 52–53) writes, “In an alienated society the whole mind-set of (people), their consciousness, is to a large extent only the reflection of the conditions in which they find themselves and of the position in

the process of production in which they are variously placed.” Therefore, while alienation is not contingent upon the perspectives of individual actors, alienation is in and of itself a social determinate of knowledge. And if that is the case, then there is a whole social psychology of alienation implied in Marx’ writings that have provided a valuable point of departure for more contemporary theorists.<sup>4</sup> Those interested in pursuing alienation and professional ethics would be well served by post-Marxian efforts to develop related concepts that extend well beyond relationships or production. These include (1) powerlessness, (2) anomie, and (3) exclusion.<sup>5</sup> I will comment briefly on each.

## Powerlessness

Powerlessness refers to a perceived lack of ability to exercise direct control of the happenings of everyday life. It is meaningful as a source of alienation only where there is some expectancy of control. The poet might note our powerlessness against the incoming tide, but this is not alienated powerlessness, unless the person holds some expectation of control. For example, Rodman and Rodman (1991) observed that rain may be considered a socially caused phenomenon produced by those occupying the specialized role of rainmaker. In such cases, there would be a culturally based expectation of control of rain and therefore the corresponding possibility of the experience of alienated powerlessness in such a context.<sup>6</sup>

Given the potential breadth of the notion of powerlessness, Seeman (1959: 785) suggests that “in the case of alienation, I would limit the applicability of the concept to expectancies that have to do with the individual’s sense of influence over socio-political events (control over the political system, the industrial economy, international

<sup>2</sup> See Tucker’s (1978) excellent edited volume *The Marx-Engels Reader* for a fine collection Marx’s writings on these themes.

<sup>3</sup> This is paraphrased from Marx’s essay *A Contribution to the Critique of Hegel’s Philosophy of Right* in Tucker (1978). See the edited volume, *On Religion* for an extended discussion of religion in the writings of Marx and Engels.

<sup>4</sup> See, for example, Archibald’s (1989) *Marx and the Missing Link: “Human Nature.”*

<sup>5</sup> I am indebted here to Seeman (1959) however take considerable liberty with his original framing.

<sup>6</sup> See Rodman and Rodman (1991). In *The Court of the Rainmaker: The Willing Deviant* in Longana, Vanuatu.

affairs, and the like).” This limitation is consistent with the neo-Marxian interest in the extent to which people come to understand their role as history makers, even though the circumstances of that history making can never be of their own choosing. When embraced as a part of a worldview, powerlessness shifts the perspective of actors away from agency and toward determinacy (e.g., a sense that participation in democracy is a futile effort).

The experience of powerlessness is distinct from the matter of whether or not the actors at hand in fact have access to power or its legitimated form *authority*. People can and do fail to recognize the extent to which power as a social resource is available within various interactions and settings.

## Anomie

Emile Durkheim directs our attention to the experience of relative normlessness through the concept of anomie.<sup>7</sup> The modifier *relative* is rather crucial here. For anomie is not so much a condition of the absence of norms, but rather there may be so many normative options available that participants may perceive that there are no *shared* expectations of behavior. Anomie addresses the breakdown in social regulation in a community and encourages an attentiveness to the individual experience thereof. Much as Marx encourages an appreciation of how alienation can be experienced within relationships of production, Durkheim focuses on how anomie is expressed through the link between the social experiences of relative normlessness and (1) how we organize our communities and our work and (2) the social aspects of suicide (and suicide rates).

Durkheim was very much familiar with the works of the French philosopher Jean-Marie Guyau, who considered himself both a philosopher and a sociologist.<sup>8</sup> It is from Guyau’s work that Durkheim borrowed and modified the concept of anomie. Guyau and Durkheim were both influenced by positivism – holding to a greater or lesser extent

that ethics based upon theology and/or metaphysics would yield, eventually, to reason based upon the human sciences (but not exclusively so). To paraphrase Guyau, the morality of future will not only be autonomous but it will also be anomic. In this sense, anomie is not an inherently problematic concept, but rather accurately captures the transition of ethics in everyday life – from the pre-industrial moral authority of the church to the more morally autonomous and scientifically informed actor. As Orru (1983: 503) suggests:

Modern people could no longer rely on religious faith or transcendental truth. Rather, they had to find a standard of conduct within themselves, in their impulse toward life. Instead of the old aphorism ‘I must, therefore I can,’ Guyau proposes the reverse: ‘I can, therefore I must.’ The essence of human life is its impulse for action, which not only creates physical fecundity, but is the fountainhead of moral fecundity as well.

Given the strong link between the concept of anomie and the moral and normative choices of actors, it is consistent with this interest that in the hands of US-based researchers, the concept proved particularly useful in the theoretical examination of deviance and deviant designations. In his essay, *Social Structure and Anomie*, Merton (1938) makes the case for attending to the structurally situated sources of anomie and the various adaptations that individuals may make in light of structural barriers in accessing the established cultural goals and the accompanying institutionalized means. In this context deviance is associated with innovation (e.g., drug dealing), retreatists (e.g., cult members), rebels (e.g., revolutionary leaders), and ritualists (e.g., those who “go through the motions” without embracing the beliefs associated with the role).

## Exclusion

Merton’s work was influential in extending the study of alienation to the experiences and processes of social exclusion and isolation. As Seeman (1959: 788–789) suggests, “The alienated in the isolation sense are those who, like the intellect, assign low reward value to goals or beliefs that are typically highly valued in the given society.”

<sup>7</sup> See Durkheim (1979) *Suicide: a Study in Sociology* and Durkheim (1984) *The Division of Labor in Society*.

<sup>8</sup> Durkheim wrote book reviews of Guyau’s work that predate his own classics sourced above.

This argument makes a clear link between alienation, anomie, and the social isolation and exclusion of individual actors. However, isolation is profitably to be framed as the outcome of the social process of exclusion. As Lemert (1962) has so carefully argued, the dynamics of exclusion are collectively enacted by others toward the target so excluded. In process terms, exclusion is experienced as (1) identities are transformed, (2) information flows change, (3) there is an increasing disjunction between word and deed, and (4) the target directly experiences exclusion from interaction sequences in everyday life. In this sense isolation and exclusion are enacted, both formally and informally. As Garfinkel (1956) notes, we may usefully cast more formal rites of exclusion as *degradation ceremonies*. Stressing the collective nature of the exclusion of others, we thereby clearly locate the alienation that is associated with the isolation of the other as the outcome of exclusion processes. This usage of alienation holds contemporary relevance for the examination of such diverse substantive issues as employee engagement (Chiaburu and De Vos 2013), self-injury (Adler and Adler 2005), and workplace bullying (Behery and Al-Nasser 2016).

## Summary

Alienation and its related concepts continue to inform discussion of quality of life, the nature of work, employer and employee relations, and the relationship between human alienation and human rights.<sup>9</sup> The link between the social science of non-alienated work and questions of the ethical workplace are intertwined, as are issues related to management and the everyday life experiences of all in the workplace.<sup>10</sup>

<sup>9</sup>For example, Turner (1993: 493) develops a sociological approach to human rights that resists Marx' scepticism concerning rights as being "merely an ideological mask of individual property rights" of elites (1993: 493).

<sup>10</sup>See, for example, Michaelson et al. (2014).

## Altruism's Moral Heuristics

Julian Friedland  
College of Business, Metropolitan State  
University of Denver, Denver, CO, USA

### Synonyms

Compassion; Empathy; Eusociality; Moral motivation; Moral reasoning; Prosocial behavior; Virtue

### Introduction

The salience of moral reasoning with respect to altruistic motivation and behavior has become increasingly evident as a number of measurement scales have succeeded in distinguishing traditional moral frames. There remains, however, ongoing debates as to (1) whether perceived altruism ever counts as genuine altruism given the motivational power of the “warm glow” agents feel from their altruistic actions; (2) whether ordinary agents – as opposed to moral experts – ever truly act for philosophical reasons, as opposed to purely emotive ones; and (3) the extent to which traditional moral frames can be accurately measured and distinguished through heuristic means. Despite these debates, there is mounting empirical evidence in favor of all three suppositions. (1) The warm glow may not be the sole motivator and may be eclipsed by greater sacrifices made, (2) traditional moral framing has become ubiquitous in core college curricula within populations increasingly college educated, and (3) heuristic evaluations have been found to be effective in predicting myriad behaviors in psychology, sociology, and evolutionary biology.

Just as agents will act with varying levels of altruism depending on degrees of social bonds, risks, and sacrifices entailed, they may also act for other reasons not yet considered by current measurement tools. For example, one particular moral motivational frame that has received increasing attention is the ethics of care approach. Although this frame is not generally treated in the predominant research on altruism heuristics per se, it is sometimes considered a subset of the virtue ethical frame within this domain.

### Motivation and Behavior

Most altruism research is based on subjects' reported preferences and intentions under hypothetical scenarios. While such data are useful in assessing the extent to which agents think along emotive and philosophical lines, they are less helpful in establishing correlations between motivational framing and actualized altruistic behavior. Indeed, there has at times been shown to be some disconnection between how agents expect themselves to act in such instances and how they actually do act when the situations present themselves in reality. While there has been substantial research indicating that agents widely purport to employ moral heuristics supporting and justifying their altruistic actions, the extent to which these heuristics have been correlated with actual behavior is considerably more limited. Still, numerous independent studies have shown that agents purport to employ moral framing heuristics consistent with traditional theoretical constructs. And while behavioral data under real stakes conditions is less extensive, it broadly confirms the conceptual framing preferences revealed in hypothetical scenarios.

The traditional moral heuristics shown to most strongly support altruistic intent under hypothetical scenarios are deontology and virtue theory to a roughly equal extent, with utilitarianism in third place and egoism a strong inhibitor. When real stakes are present, the frames are somewhat less clearly distinguishable. For example, when subjects have been observed behaving altruistically in economic dictator games, the organizational

science literature has tended to extrapolate it as motivated by deontic justice framing. Alternately, when law and economics scholars have observed altruism in real-world civic contexts, i.e., voting, taxation, sustainability, etc., they have extrapolated it as motivated by virtue ethics framing. They have also found that as economic incentives become pervasive, they tend to corrode or “crowd-out” altruistic civic behavior. More recent behavioral data has found that deontological and virtue-ethical heuristics overlap as strong predictors of altruist actions, with utilitarianism in second place and egoism as an inhibitor unless the actions are made public, in which case egoism becomes a social status incentive to be perceived by others as altruistic.

## Theoretical Foundations

Traditional moral frames should not be considered as having no overlapping definitions of goodness. They naturally do, given that they are alternate perspectives of a common prescriptive reality. Their differences are therefore mainly a matter of degree and emphasis on certain aspects or poles of the moral landscape. Further, when reduced to heuristic shorthand, the more subtle distinguishing features tend to disappear, especially in the minds of non-experts. That said, the following are essential aspects of the “Big 4” western moral frames that have been found to be heuristically salient in observed altruistic behavior.

### Deontology

Deontology is defined etymologically as the logic of duty. Goodness is thereby conceived as a matter of strict rule-based principle as opposed to consequences. The theory, originally attributed to German philosopher Immanuel Kant, takes goodness to be an objective aspect of reality governed by the logic of universalizability, meaning all good acts must be logically universalizable and not self-defeating. For example, deception is always immoral since if everyone were to lie when it benefitted them, there would be no more

advantage to be derived from deception since trust – the social glue that liars exploit – would evaporate.

Moral imperatives are dictated by our own rational self-consciousness aimed at emulating the best possible world. It is this ability to acknowledge our own moral conscience together with the logical fabric of goodness that makes each of us into autonomous agents or “ends in ourselves.” It is therefore at once irrational and immoral to neglect or exploit thinking beings, for to do so would be to treat them as pawn-like objects with no intrinsic aims of their own. As such, all persons should expect to receive reasonable altruistic consideration in times of basic need, so long as others are materially disposed to provide it without thereby sacrificing their own basic needs. This norm is commonly implied in the deontic “golden rule” of doing unto others as you would have them to do unto you.

### Virtue Theory

Virtue theory defines goodness functionally as that at which all things aim, namely, self-actualization or fulfillment. It is the oldest Western moral frame, originating in Ancient Greece, notably in the works of Plato and especially Aristotle. Its approach is uniquely psychological, as it is focused on what makes a person good as opposed to what makes an action good – which other frames address directly. As such, what makes an action “good” is measured less by how it affects the world than how it shapes and reveals the character of the individual engaging in it. Essentially, one becomes good by cultivating virtues just as one learns to excel at piano by practicing the piano. The most important virtue is temperance or moderation, as immoral acts are seen as the result of placing excessive or deficient importance on certain desires.

Virtue theory is altruistic because it considers human nature as essentially social, thereby rendering virtuous development impossible in isolation. Incidentally, a growing sociobiological literature suggests that altruism has been biochemically embedded as an adaptive trait in species defined as “eusocial” including our own.

Since moral virtue is only achievable in harmonious relations with others, egoistic persons who only pursue their own self-interest are seen as conflicted, self-loathing, and ultimately unable to reach fulfillment. If such persons claim to be happy, they are thought to be confused about the nature of both goodness and happiness, which go hand in hand.

### Utilitarianism

Utilitarianism defines goodness as what is most “useful” for achieving the greatest happiness for all concerned, where happiness is conceived as pleasure absent pain. As such, and counter to deontology, it is a form of consequentialism, in which end results always justify means. The theory is most closely associated with the British enlightenment, originating in Scotland with David Hume and Adam Smith, and further developed by English philosophers Jeremy Bentham, John Stuart Mill, and Henry Sidgwick. Utilitarians believe everyone’s interests should be considered equally and that achieving the greatest balance of pleasure over pain for all is the absolute aim. While there exist more sophisticated forms of utilitarianism, including rule utility and preference utility, heuristic approaches are usually limited to the act utilitarian approach expounded by Bentham.

The utilitarian frame is extraordinarily selfless since it requires that we choose whatever action effects the greatest happiness for the greatest number. None can privilege their own position unless doing so would turn out to increase total net happiness for everyone. Utilitarianism is particularly helpful in situational dilemmas in which costs and benefits must be tabulated in order to arrive at the most “optimific” outcome for all concerned. Although its adherents take it to be just as egalitarian as deontology, it is not as deeply rooted in fairness because it upholds the consequentialist doctrine that the ends always justify the means. Thus, it may be necessary to inflict lesser harms to some to avoid greater harms to others – an option deontology rules out. Utility admits no categorical rules since any action is theoretically permitted in some hypothetical

scenario. Recent work suggests that a two-dimensional model of utilitarian psychology may exist – in lay respondents but not moral philosophers – opposing impartial beneficence and instrumental harm when considering sacrificial dilemmas.

### Egoism

Egoism is traditionally defined as the self-interested point of view. While psychological egoism has been influential in evolutionary theory and economics, ethical egoism has had few adherents in the philosophical literature. While some may postulate that Adam Smith, inventor of the “invisible hand” theory, was an adherent, he was in fact a proponent of virtue theory, only defending the profit motive as a more effective economic driver than benevolence or altruism. The German philosopher Friedrich Nietzsche is perhaps the only great thinker directly associated with egoism in both ethical and psychological forms. According to his account, human behavior is primarily motivated by the will to power. Still, Nietzsche was also heavily influenced by Aristotelian virtue theory, recognizing human nature as social.

Ethical egoism is never a direct motivator of altruistic behavior. It is not necessarily antisocial however, since apparent altruistic behavior will still be carried out either unwittingly or cynically as an indirect means of leveraging instrumental advantage. When taken to its extreme, psychological egoism can become sociopathy, namely, the clinical inability to experience empathy. Research suggests that an egoistic corporate culture has more than doubled the proportion of executives with sociopathic tendencies in corporate America than in the wider population. Some have taken this as evidence to suggest that the Great Recession of 2008 was caused in part by such a culture.

### Frame-Specific Heuristics

In the most comprehensive study of its kind, those most likely to act altruistically and to give higher amounts were found to think along *both*

deontological *and* virtue-ethical frames, espousing the following values:

### Deontology

1. I try never to break any moral rules.
2. I try to think and act logically in every situation.

### Virtue Theory

1. When I choose to act ethically, I am also choosing to become a better person.
2. Acting ethically is more personally fulfilling to me than acting unethically.

The next heuristic frame also found to be predictive of altruism and of giving higher amounts in certain instances is the utilitarian, espousing the following values:

### Utilitarianism

1. I try to do whatever brings the most happiness for the most people.
2. It matters more to feel good than to think and act logically.
3. A good intention is more important than a good result.

While the focus on intention in utilitarianism's statement 3 is traditionally more reflective of deontology or virtue theory, it was found to correlate with the utilitarian heuristics in several manipulations and demographic groups. This could reflect that respondents were thinking about the practical importance of acknowledging the goodness of right aims regardless of whether targets are reached due to extenuating or unforeseen circumstances or respondents were simply not espousing an entirely consequentialist mindset.

Conversely, the next heuristic frame, egoism, was found to be predictive of decreased altruism and of giving at lesser amounts. Interestingly, this was only the case when the giving was anonymous. When it became public, it actually predicted higher rates of altruism and giving at higher amounts, suggesting that the associated

potential for increased social status acted as a powerful motivator.

### Egoism

1. I tend to place my own interests above those of others.
2. I sometimes break a moral rule to achieve the best result.
3. The results of my actions matter more than how or why I go about doing them.

The only statement uniquely reflective of traditionally egoistic framing is statement 1. However, statements 2 and 3 were espoused along with it in several different manipulations and demographic groups. This highlights the consequentialist aspect of egoism that was notably absent in the utilitarian heuristic.

The study seemed to uncover a fifth heuristic framing not anticipated, namely, what appeared to be a kind of self-abnegation, which was consistently predictive of altruism and sometimes higher rates of giving.

### Self-Abnegation

1. Too much of anything is bad.
2. I think no one should have to suffer for the benefit of others (reversed).

These statements were originally conceived as measuring virtue-theoretical framing. However, the second reversed finding seeming to imply that some *should* have to suffer for the benefit of others. And the fact that it appeared consistently with the first statement in several different manipulations and demographic groups seemed to indicate a potential self-abnegation heuristic that is also strongly predictive of altruism. It may be indicative of internalized Judeo-Christian norms. More study is needed to substantiate these possibilities.

## Implications for Business Culture

Such findings broadly confirm that altruistic behavior is associated with moral framing

heuristics consistent with traditional philosophical approaches. Practically, however, behavioral findings indicate that moral frames may present in more nuanced manners than theoretically conceived. Specifically, there is clear evidence that deontological and virtue-theoretical norms are intertwined. As such, virtue-theoretical framing may provide a kind of psychological payoff to deontically oriented persons. Other research suggests that moral priding can function as a particularly effective motivational tool for socially conscious workers and consumers. Additionally, literature on moral crowding out has shown that instrumentally egoistic appeals tend to discourage those with moderate to high intrinsic motives. Therefore, alternate motivational avenues for such persons, directed at aims of deontology and virtue, may help to optimize socially responsible marketing strategies. Alternately, utility-oriented persons may be more moved by empathic concern for the general well-being of all. Ultimately, all four frames (excluding egoism) could be harnessed together as more effective appeals to inspire and crowd-in civic and altruistic behavior than any frame working on its own.

There is also some indication that altruism can be activated to an extent via empathic priming or experiences of awe inducing a small sense of self. Unfortunately, once altruistic dispositions fade within a cultural environment in which economic incentives are ubiquitous, they are difficult to effectively re-instill over the long term through empathic priming alone. Empathy may cloud moral thinking and its overemphasis may result in compassion fatigue. This raises the possibility that heuristic moral framing together with empathic priming might help crowd-in altruistic behavior more durably than empathic priming alone. On the other hand, it is rather more difficult to turn those with a strong sense of egoism away from what they consider self-important. It may however be possible to convince them that helping others is ultimately in their own self-interest. Evidence suggests that introducing motivational nudges rewarding those who act for the greater good with positive encouragements such as praise and social status benefits can be highly effective at least in the shorter term. But for less egoistically

oriented persons, evidence strongly suggests that appealing to moral-philosophical heuristics such as deontology-virtue and utilitarianism may be more effective than instrumental appeals to power and social status in instilling a professional and consumer culture of altruism.

## Animal Ethics

Monique R. E. Janssens<sup>1,2</sup> and  
 Franck L. B. Meijboom<sup>3</sup>

<sup>1</sup>Rotterdam School of Management, Erasmus  
 University Rotterdam, Rotterdam, The  
 Netherlands

<sup>2</sup>Ethisch Bedrijf, Utrecht, The Netherlands

<sup>3</sup>Ethisch Institute, Utrecht University, Utrecht,  
 The Netherlands

## Synonyms

Responsible treatment of animals, in accordance  
 with their moral status

## Definition

Animal ethics deals with the question how non-human animals should be treated. This implies a discussion about whether animals are morally important for their own sakes and, if so, what consequences follow for human action. Traditionally, animal ethics is concerned with individual animals and their inherent value, their interests, and their preferences.

## Approaches

As in business ethics and many other ethics disciplines, the most common approaches of animal ethics are consequentialism, deontology, and virtue ethics. What these approaches have in common is that they include sentient animals in the sphere of the morally relevant. This means we should take them into account for their own sakes when deciding about the rightness or wrongness of our actions.

### Consequentialism and Utilitarianism

In 1780, the father of utilitarianism, Jeremy Bentham, wrote down a short but famous fragment on what we would now call animal ethics: “The question is not, Can they reason? nor, Can they

talk? but, Can they suffer?” With these words, he creates the inclusion of sentient animals (animals who can experience pleasure and pain) in the sphere of the morally relevant. If a utilitarian – a consequentialist who sees welfare or happiness as the central value that should be maximized – is calculating the added or diminished value for all affected, the added or diminished value for affected animals counts as well. To put it simply, as soon as we know other creatures can be harmed by the experience of pain, we should take them into account, because being sentient is why we as humans count morally too. In our times, this approach has been developed further by Peter Singer, theoretically as well as practically. He examines how we should weigh the different value changes for animals and humans in different situations and argues that by the above definition, at least all vertebrates (without ailments that prevent them from feeling pleasure and pain) are morally relevant and that their interests should receive equal consideration.

### Deontology and Rights Ethics

According to Immanuel Kant, humans have direct duties toward other rational beings, who have moral agency. Toward animals, who are non-rational beings without moral agency, humans have only indirect duties, meaning the following. People who behave badly toward animals, by these actions, could hurt the feelings of humans or start behaving badly toward humans too. Although the first is very plausible by intuition, and the latter today is supported by social psychology, there have been many calls for additional recognition of direct human duties toward animals. Korsgaard, for example, has argued that animals are rational beings as well, which means that we do have direct duties toward them, although they are of another nature than the ones we have toward humans. Tom Regan developed a deontology-inspired rights approach to animal ethics, by which he claims that humans have direct moral duties toward animals of the same nature as our duties toward humans. His approach is based on the inherent value of what he calls subjects of a life: sentient individuals who have, apart from their sentience, extra violable abilities,

like memory and belief. They are aware of the world and of what happens to them, and they act intentionally. These subjects of a life are moral patients: whereas they lack the capacity of moral agents to do right or wrong, or to reflect on their deeds, they can undergo right and wrong. Therefore, they have inherent value and a right to be treated respectfully and not to be harmed. There are circumstances where it is permitted to override this right: if not harming them would harm an even greater number of moral patients. On these grounds, Regan includes in the moral realm mammals from around the age of 1 year (like he does with young children and mentally handicapped people with an intellectual disability). At the same time, he remarks that it is difficult to draw the line and that the group of subjects of a life might be larger, including, for example, birds.

### **Virtue Ethics-Inspired Capabilities Approach**

Martha Nussbaum developed a virtue ethics-inspired capabilities approach for animal ethics (although she denies the existence of any such unitary approach as “virtue ethics”). Her approach holds in short that based on an attitude of wonder and respect toward other creatures, we should allow animals the capabilities of flourishing in their own specific ways. She translates the list of capabilities this approach assigns to humans to a list of capabilities animals should be allowed. These are life, bodily health, bodily integrity, access to sources of pleasure, emotions through attachment to others, practical reason (to the extent to which the capacity is present in the animal), non-humiliation, relationships with other species, play, and control over their environment. Nussbaum does not go very deep into differences between animal species but acknowledges that priority should be given to changing the situation of animals who suffer from the way they are treated.

### **Which Animals to Include: Some Consensus**

Departing from differing ethical strands, the philosophers mentioned above seem to agree that vertebrates are the first to be taken into consideration: mammals in the first place and probably

also fish, birds, reptiles, and amphibians. Apart from that, research shows that more species can have experiences they evaluate as positive or negative and recognize stimuli for which they take an effort to encounter or to avoid them. To begin with, crustaceans and octopuses were added to the list of animals with sentience. Today, there is discussion about, for example, shrimps and bees. Knowledge about the biological systems of animals is increasing rapidly. Animal ethicists are pleading for giving more animal species the benefit of the doubt and treat them respectfully by avoiding the risk of making them suffer.

### **Worlds Apart**

In businesses, animals are often treated as an instrument for human goals. They are bred, caught, and fished to serve as food. Special breeds are formed to obtain laboratory and companion animals. In circuses and dolphinariums, animals are taught tricks for human entertainment. Others are trained to do agricultural, rescue or guide work for humans, etc. Apart from that, companies have an indirect impact on animals, through, for example, habitat destruction, road kill, food policy in company restaurants, and pollution, including noise and light. From an animal ethics perspective, it is disputable whether business activities involving animals are ethically sound and, if so, under which conditions. The issue here is to what extent a company is morally allowed to use or harm animals for its own benefit. Though awareness is growing, many companies lack an ethical stand toward animals.

This is reflected in business ethics. In this academic discipline, there is hardly any systematic attention to animals. In animal business literature, animal issues are not often listed among corporate responsibilities. Theories of business ethics in many cases ignore the issue of animal ethics or touch upon it no more than shortly. Rather than as an independent question, the issue of responsibility toward animals is often addressed as a commodity or as a dimension of a public health or an environmental issue. This

situation disregards the academic debate on what we owe to animals and hardly pays attention to the moral problems that occur when companies deal (directly or indirectly) with animals. Based on what is achieved in animal ethics, the discipline should have its own position in corporate responsibility and professional ethics.

### **Different Roles of Animals in Relation to Companies**

Including animals into ethical reflection of companies is complicated, not only because of the huge variety between animals and animal species but also because humans relate to animals in very different ways. Animals can be classified in six categories of relatedness to people: farmed animals, research animals, wildlife, animals in entertainment, working animals, and companion animals. This is not a static categorization. Animals can change categories. Wildlife can be captured and put in a zoo to continue its life as an object of entertainment. A farmed animal can be purchased by a private person and be kept as a companion animal. The largest numbers of animals owned by companies are farmed animals and research animals. Smaller numbers of animals are found in entertainment, as working animals (on small farms, in service dog organizations, police forces, and rescue organizations), and in companion animal breeding businesses. The relation between businesses and wildlife is in many cases not ownership but indirect impact.

### **The Extent of Corporate Responsibility**

Where the legal responsibilities of a company toward animals are relatively clearly defined, the moral responsibilities are not. What a company owes to animals in moral terms depends on its relationship with animals. Companies that own animals bear a primary responsibility, resulting in a duty of care, both legally and morally. However, moral responsibility is not limited to owners; it is passed on through the production chain and affects the responsibility of business partners. Each company who buys animal-based products bears a shared responsibility for the animals the products were derived from. And even outside the

production chain, procurement is a responsible activity. In this way, every company has an impact on animals, be it by serving animal-based food in its company restaurants. Therefore, it is important that each company determines the extent of its own responsibility and the relative proportion of it among other responsibility issues. To accomplish this, it is wise for companies to be open to the opinions of all stakeholders. One can think of investors, partners in the production chain, customers, employees, animal welfare NGOs, the general public, etc. Apart from that, there are good arguments to say that the animals themselves are stakeholders too. They are affected by certain actions of companies, although they cannot express themselves – but neither can young children, and still allowing child labor is not done.

### **Implementation of Animal Ethics in Business Practice**

To make the moral responsibility operational, companies often refer to the attention paid to animal welfare and especially to the so-called five freedoms. These were formulated by the Brambell Committee as an ethical guideline for better treatment of farm animals in 1965. The Farm Animal Welfare Committee of the UK reformulated them as:

- Freedom from hunger and thirst
- Freedom from discomfort
- Freedom from pain, injury, or disease
- Freedom to express normal behavior
- Freedom from fear and distress

Although these five freedoms are widespread and reflected in legal texts, they tend to be insufficient to deal with the range of responsibilities of companies in the context of animals. They are a “moral floor” rather than a “moral ceiling” that one could strive for. They offer no handles for determining the extent to which these freedoms should be provided. Secondly, the five freedoms are highly utilitarianism inspired and lack room

for notions like respect for animals and rights of animals.

### Ten Steps to Dealing with Corporate Responsibility Toward Animals

To include animal ethics in the accountability of a company, there are several steps a company can take:

1. Start a think tank for animal ethics.
2. Identify the impact of the company on animals. Organize a brainstorm with the help of independent ethicists. Listen to animal welfare NGOs during the process.
3. Identify the corporate ethical position toward animals. What is the view of the company on animals? Are they things, resources, or living beings? Does their welfare count? Do their rights count? Do their capabilities count? Invite an independent ethicist to moderate the process.
4. Do a materiality analysis and identify the importance of animal ethics for the company, in the light of its responsibilities.
5. Search the corporate website for the word “animal” and have a look at how the company is talking about animals there. (You can also do a Corporate Commitment to Animals scan; see Janssens and Kaptein 2016.)
6. Adopt animal welfare as an official corporate responsibility issue. Include it in the business code and the responsibility report. Tell the public about it on your website and in other documents.
7. Connect goals to new insights and plans, design programs, and implement them.
8. Dare to be a leader in your industry.
9. Tackle challenges in partnerships with relevant partners (NGOs, researchers, the government, industry partners, etc.).
10. Inform the media honestly and transparently, in cooperation with your partners.

### Summary

Animal ethics is not just an add-on for business ethics. Based on what is achieved in the field of

animal ethics, any professional in any organizational context has moral reasons for being aware of special responsibilities toward animals. Although there are different accounts in animal ethics, they all agree on the importance of taking the life and welfare of sentient animals into account in decision-making. This can be done by taking steps from identifying an ethical stance toward animals to taking action and communicating transparently about the actions taken and the results achieved.

## Animal Ethics and Autonomy, Agency and Selfhood

Natalie E. Thomas

Department of Philosophy, University of Guelph,  
Guelph, ON, Canada

### Synonyms

Animal Agency; Animal Autonomy; Animal Ethics; Animal Self-Awareness

### Introduction

Animal ethics studies the various ways that we value nonhuman animals and examines the fundamental question of whether or not, and to what extent, we owe them moral consideration and obligations (Thomas 2016). Many theories and positions within this discipline pay close attention to the developments in the study of animal minds with an understanding that many of the morally relevant features humans possess are shared with other species, especially mammals. Such features include but are not limited to agency, selfhood, self-awareness, and autonomy. If animals are autonomous and self-aware agents, then we ought to take their lives and the quality of their lives much more seriously than we do now, and we ought to reassess our treatment of both wild and domestic species and our relationships with them.

### Animal Ethics

Derived from the philosophical study of ethics, many views on animal ethics are based on moral principles that characterize the main theoretical positions such as utilitarianism, care ethics, virtue ethics, and Kantian and post-Kantian deontology. These theoretical positions, while often sharing similar conclusions in terms of the need to recognize the moral value of nonhuman animals, differ in their approaches to answering the question of

why animals ought to be morally considerable. Some, such as deontology and utilitarianism, focus on shared mental or cognitive capacities between humans and other animals, such as the ability to experience suffering, sentience, or self-awareness as the source of moral obligation (Singer 1975/2009; Nussbaum 2007; Regan 1983). Others, such as care ethics and empathy perspectives, focus on the relationships between humans and animals themselves, and the resulting entanglements (Gruen 2015). These various positions on the morally relevant capacities of animals lead to different types of ethical positions on the actual treatment of animals. Such positions include animal rights, animal welfare, and animal abolitionist perspectives that differ from each other quite dramatically in application. As such, any theoretical clarity regarding both what mental and cognitive capacities animals possess, along with an informed analysis of how these capacities underlie our moral obligations to animals, is fundamental to the study of animal ethics. Through the use and analysis of research on animal minds from the fields of psychology, neuroscience, cognitive ethology, and other related scientific areas, it is possible to glean a cumulative body of evidence to support the claims that nonhuman animals (mammals, birds, and possibly other species) possess cognitive capacities such as agency, selfhood, and autonomy. As the moral relevance of these capacities is already established within ethical theory, particularly from a deontological perspective, a theory of animal ethics based on these particular capacities is scientifically informed and morally robust.

### Animal Agency

#### Agency and Its Features

Agency is considered to be a morally relevant feature of humans as it makes intentional action possible, which entails the rights to certain forms of treatment, including the respect for one's choices. As we must assume that many nonhuman animals possess beliefs in order to be considered appropriate subjects of study in cognitive studies (Andrews 2015), we can also infer from this that

these beliefs underlie intentional action. If this is true, then both humans and nonhumans are agents, even if animals are only minimally so (Thomas 2016). Animal agency, and what constitutes it, has become of more interest in recent years to animal ethicists looking to establish the moral value of animals and which specific mental capacities might be relevant to the endeavor to do so (Sebo 2017; Wilcox 2020a; Korsgaard 2018). There are of course different types or degrees of agency and intentional action that are further dependent on the degree to which nonhuman animals possess capacities like rationality and intentionality, as well as the ability to have beliefs, desires, goals, and preferences that motivate action (Thomas 2016). For example, rationality is what allows for a creature to have reasons for acting. Rationality does not need to be extremely advanced or complex in order for it to play the necessary role in directing intentional action. Rather, it is justifiable to explain and predict an animal's behavior by assuming that it possesses beliefs and mental representations of the world around them (Thomas 2016). Taking an intentional stance toward animals simply means that it can be assumed to be an intentional agent so long as its behaviors can be explained and predicted by ascribing certain beliefs, desires, and preferences to them. This is enough to accept that animals are agents (Dennett 2009).

### Animals and Moral Agency

More recent work on animal agency questions whether or not animals can also be moral agents, in addition to being acting agents, and although there is still considerable debate, it is possible to identify ways that some social mammals might be acting on the basis of moral reasons, even if they are minimally so. For instance, Rowlands (2012) believes that if an animal acts from moral emotions such as empathy, then the animal can be said to be a moral subject. Without the ability to fully evaluate their own moral emotions, animals cannot be said to be moral agents, although the evolutionary basis of moral agency is clearly demonstrated in other social species. On the basis of these arguments, there is good reason to

believe many animals, including mammals and birds, are acting, intentional agents.

## Animal Selfhood

### Self-Awareness and Self-Consciousness

Self-awareness or self-consciousness is a feature of agency, insofar as it's what allows for a creature to be aware of its own beliefs, desires, and preferences, and this need only be in a minimal sense for it to be constitutive of selfhood (Thomas 2016). It is also what allows a creature to base its choices on its preferences, so self-awareness has moral significance as the basis of autonomy. Evidence to support the existence of self-awareness in many species, including mammals and birds (and potentially others), comes from a variety of research sources as well as various types of arguments, such as evolutionary continuity and the logical requirement of self-awareness for the exhibition of intentional behaviors (DeGrazia 2009; Griffin 2001). Some specific forms of evidence include mirror self-recognition tests, the use of tools, the ability to communicate within and across species, the ability to learn and to solve problems, the ability to exhibit self-control, and the possession of episodic memory, among others (Thomas 2016). The challenge is that without spoken language, animals cannot possess the concept of 'I' in the same sense that humans do and thus cannot develop the concept of personal identity to the same degree as humans. However, self-awareness admits to degrees of complexity, both among humans of different ages and cognitive abilities, as it does between nonhuman animal species (Thomas 2016).

### Minimal and Rich Selfhood

The most minimal sense of self can be described as phenomenal or as a felt sense of "body-ness" or "mineness" (Zahavi 2005). Self-awareness can be minimal or richly complex and this is dependent on other relevant cognitive capacities, just as we see with agency. Of course, this means that there is great difficulty in identifying where the line between a minimal sense of self and a more complex and rich sense of self-identity can be drawn,

but this is not necessary to draw the conclusion that conscious animals are self-aware to varying degrees, and this means that they have experiences that matter to them. This is morally relevant. It means that animals can act in accordance with their beliefs, preferences, and desires and that they are free to do so as acting agents unless otherwise restricted or harmed, meaning that there is value in liberty for both humans and other animals (Thomas 2016; Wilcox 2020b). Selfhood exists on a continuum across species, with more minimal forms in animals that possess phenomenal self-awareness as well as richer forms that include more reflective concepts of self-identity and desires for self-improvement. As new ways of studying self-awareness in animals evolves, so too will our ability to identify selfhood across species.

## Animal Autonomy

### Concepts of Autonomy in Animals

Autonomy is an important moral concept often considered to be a unique human feature that is possessed by full persons. Generally, it refers to someone's ability to make choices freely and based on their own reasons (Thomas 2016). It is also a concept that is defined in a number of different ways that can range from self-control, moral or normative autonomy, to complex and ideal conceptions of autonomy as heroic or authentic forms of being (Arpaly 2003). Despite the wide range of possible definitions, it is clear that most conceptions rely on an assumption that reflection on reasons for acting is required, and that only humans are capable of such reasoning. This means that only humans can be autonomous. However, as the knowledge of animal minds and their cognitive capacities has grown, so too the concept of autonomy has been drawn into deeper examination. If animals can be acting, intentional agents who possess self-awareness, then it's possible that they are capable of acting freely, and for their own reasons, however minimally rational they may be (Thomas 2016). Autonomy then can exist in both minimal and rich forms, depending on the extent to which an animal is

self-aware and able to direct its own actions toward fulfilling its goals, desires, and preferences. Minimal autonomy can be as simple as the freedom of a mouse to choose which path to follow through the field (Waller 2002), or the freedom to direct one's actions toward attaining goods as a result of being self-aware and having self-directed behaviors (Thomas 2016). Animal autonomy is increasingly considered to be plausible for those investigating animal minds and behaviors (Andrews 2013), and animal personhood (Rowlands 2020).

### Moral Relevance of Animal Autonomy

Animals that possess self-awareness must also be autonomous to the extent that they can act freely. Animals may not be moral agents, as they cannot rationally reflect on their reasons for acting, but because they can be autonomous, even if minimally, they are owed respect for their autonomy in both negative and positive ways (Thomas 2016; Gewirth 1978). This is morally relevant for answering questions about whether or not animals deserve certain types of rights and whether or not they should be considered persons (Rowlands 2020; Regan 1983). How humans treat other species is then dependent on whether and to what extent they possess agency, self-awareness, and autonomy. Different species will have different desires, capacities, and interests or "goods" that they strive to attain, and this will inform the ways that we can both harm and help them in pursuing their own goals and living autonomously to the greatest extent possible, as is dictated by the respect of autonomy (Thomas 2016). Treating animals with respect to their autonomy would radically change many of our current relationships with them, including keeping animals in captivity and using them as objects for profit rather than as autonomous individuals, even if minimally so.

## Summary

As research on animal minds and cognition increasingly provides us with the understanding that many species are capable of agency and self-awareness, theoretical perspectives in animal

ethics continue to evolve. Once thought of as a characteristic of only humans, autonomy can exist in both minimal and rich levels in other animal species, and this has implications on the theories of animal ethics as well as the practical aspects of our relationships with them. More detailed knowledge of the beliefs, desires, and preferences of nonhuman animals through future research can assist us in determining which ones possess agency, self-awareness, and autonomy, as well as informing us how to respect their autonomy to the greatest extent possible, even if it exists in a more minimal form than what we find in most humans.

<sup>2</sup>Philosophy, Nipissing University, North Bay, Canada

## Synonyms

Animal ethics; Animal welfare; Business ethics

## Introduction

Animal ethics is interdisciplinary and includes a wide range of views on the moral value and treatment of nonhuman animals (animals), forming a continuum from animal welfarism to abolitionism (Thomas 2016). Moreover, the use of animals in business is widespread and the types of use diverse, such that ethical analyses and consideration of harms caused to animals and the humans who work with them bring together aspects of

both animal ethics and business ethics. Positions on the use of animals in business practices vary according to the theoretical dispositions available via animal ethics, and the situation evolves as business practices involving animals evolve.

## Animal Ethics and Perspectives

### A Continuum of Views on Animal Ethics

Animal ethics theories provide rational bases of various kinds in favor of the moral consideration of animals and they can be placed on a continuum. On the one end of the continuum are animal welfarists, who assume that it is morally acceptable to use animals for human purposes provided their welfare is taken into consideration. For instance, research in animal welfare might include things like enriching the farm environment to reduce stress responses in the confined animals, thereby increasing efficiency and production, or finding more humane and less painful ways to end animals' lives for meat production (Dawkins 2012). Occupying the middle of the continuum are theories that consider the extent to which animals are intrinsically deserving of greater moral consideration, and the most common of these theories include utilitarian, deontological, virtue-based, and feminist care perspectives (Korsgaard 2018; Nussbaum 2007; Regan 1983; Singer 1975/2009; Thomas 2016). Utilitarianism and deontology focus on the importance of the inherent traits or characteristics animals possess, such as cognitive capacity, sentience, the ability to suffer, and degree of agency, that allow for animals to flourish or live according to their interests and preferences. Virtue ethics approaches are aimed at the development of virtues that take into consideration the appropriate ways to treat animals given their capacity to be harmed, while feminist care perspectives focus on the nature of the relationships between humans and other animals and consider various types of entanglements that inform our ethical dispositions and actions, such as the emotional bonds that can develop between a human caretaker and an animal intended for slaughter, for example (Gruen 2015). On the other end of the spectrum,

abolitionists and strong animal rights advocates generally argue that we ought not use animals for human purposes at all, regardless of the reasons (Francione 2008). Also worthy of note are religious views of animals that fit into the continuum at various points on an individual basis (Linzey 2009). For instance, the value of animals and views on how they ought to be treated and used from a Jain perspective differs considerably from a Catholic perspective, and each finds its own place on the continuum accordingly.

### Interdisciplinary Perspectives on Animal Ethics

Although animal ethics originated in the discipline of philosophy, the study of animal ethics is becoming increasingly interdisciplinary as more scholars recognize ways that their own academic disciplines contribute to the body of knowledge that informs the ways we understand, value, and treat other animals (DeMello 2012). Moreover, research from other disciplines, such as the behavioral sciences (comparative psychology and ethology, for example), has a direct bearing on the moral status of animals, insofar as such research supports claims that animals possess certain traits or capacities such as agency, intentionality, consciousness and self-consciousness, and rationality, thereby reducing or eliminating the perceived gaps between humans and other animals in such a way as to make animals deserving of moral consideration. Additionally, the social sciences and arts and humanities disciplines are increasingly including the study of human-animal relations in such areas as animal studies and critical animal studies. Subjects such as sociology, religious studies, political science, film, and even theater now consider "the animal question" in terms of how animals are to be valued, used, and depicted. Each distinct academic discipline brings something unique to the study of animal ethics and this allows for issues and topics that might not otherwise be identified or considered to come to light. This shows the relevance of animal ethics to more issues than just some of the more abstract moral considerations that can occur within a philosophical perspective, which enriches and expands the applied aspects of this area of study.

## Animals and Business Practices

### Uses of Animals in Business Practices and Industries

Many businesses and industries exist solely because of animals, while others indirectly affect animals. Animals are directly used in the agriculture, tourism, research and experimentation, clothing (leather and fur), entertainment (zoos, aquariums, film/television and circuses), working and service animals (as a form of labor), and companion animal industries as sources of profit (Thomas *In Press*; Linzey and Linzey 2018; Fennell 2012). Businesses in such industries rely on the use of animals bred and kept in captivity of various forms, which can, under many circumstances, cause physical, mental, and emotional suffering (McMullen 2016). Transportation of live animals, slaughter, experimentation, forced performance, breeding, forced milking, and forced laying of eggs are just a few examples from an indefinitely long list of practices resulting from the human demand for animal products that cause animal suffering and strip animals of dignity. Indirectly, companies can impact ecosystems through the exploitation of natural resources or the creation of pollution, for example, and can also impact the lives of wild animal species by destroying wild animal habitats directly or by contributing to climate change, leading to the eventual endangerment or extinction and displacement of wild animal species. Deforestation is one example of such practices that can impact ecosystems, species habitats, and climate change, thereby increasing the reach of harmful effects to animals on a much larger scale. The introduction of invasive species and diseases can occur through the shipment of materials and products leading to reduced biodiversity both in the home country and abroad, and where there are multiple companies in functioning in the same vicinity, collective harms to biodiversity and wild animal populations can be magnified. Businesses and industries can thus cause harms to local and remote ecosystems, both directly and indirectly, resulting in harms to wild animal species and reduction in biodiversity which can ultimately run counter to the pursuit of profit.

### Humans in Animal-Related Business Practices

Businesses and industries that use animals rely on human labor to perform the work that goes into the care, maintenance and processing of those animals. Some jobs involve direct work with animals, such as farm laborers, technicians, veterinarians, truck drivers, laboratory workers, slaughterhouse workers, trainers, and zoo and circus keepers, for example. There are also jobs that involve indirect forms of work with animals, such as the processing of animal parts into food or clothing products and materials. Because many of these jobs involve causing harm to animals or witnessing the suffering of animals, there are negative effects on the psychological well-being of human laborers (Coulter 2016; Porcher 2017; Stull and Broadway 2004). Desensitization to the suffering of others, animal or human, can lead to the repression of natural responses such as empathy and compassion, which can in turn lead to mental and emotional suffering. Both post-traumatic stress disorder (PTSD) and perpetuation-induced traumatic stress (PITS) can result from causing harm and suffering to animals and these disorders can have serious effects on the well-being of workers and those around them. There is also the possible inducement of moral stress and trauma created by the infliction of suffering and pain on animals through their slaughter and generally inhumane treatment. These effects impact not only the individuals and who work under these conditions but also radiate outward from one's psyche to society at large. Additionally, there are many physical and health-related harms for workers caused by the exposure to harmful gases and other occupational injuries. In many cases, the exploitation of animals within these industries is inextricably tied to the exploitation of human workers, creating mutual forms of suffering.

## Business Ethics and Animals

### Ethical Issues for Businesses Using Animals

Many basic issues in animal ethics pertain to the use of animals in business, such as the suffering of animals themselves both as individuals and

species caused by economic exploitation of animals, the suffering of human laborers within these industries, the environmental impacts of economic activity on animals directly or through loss of habitat, and the moral challenges posed by the creation of new technologies that can exacerbate harms to animals (Thomas [In Press](#)). In addition to these are concerns raised by consumers about the ethical implications of purchasing animal products. Environmental impacts of animal agriculture include the production of greenhouse gases created not only by the animals themselves, but also through the destruction of forests to create land for grazing, making the meat production industry one of the leading drivers of climate change and global warming (Kimmerer [2015](#)). In turn, climate change leads to the loss of biodiversity, including the extinction of insects and other wild animal species. New technologies, such as gene editing, may provide innovative ways to modify animals to reduce their suffering and potentially their environmental impacts, but these types of technologies give rise to more complex ethical issues involving questions about animal dignity and new forms of suffering for both animals and the humans working with them (Coulter [2016](#); Porcher [2017](#)). Some believe that new technologies providing humans with the ability to create meat in laboratories (in vitro or cultured meat) may solve both the environmental issues and animal suffering concerns related to animal agriculture, but this turns on the ability to mass-produce these products at a price point that consumers will agree to, along with the ability to overcome consumer distaste for such products. Whether or not consumers are willing to pay more for more “humane” or ethically produced animal products is inconclusive, although there is an increase in those adopting vegan and vegetarian diets, as well as a rise in related food companies and businesses. Addressing the key ethical issues of harms to animals, harms to human laborers within animal-related industries, environmental impacts of animal agriculture, and the implementation of new technologies that are used to modify animal bodies are key issues that must be addressed by

businesses directly and indirectly using animals for profit.

### **Areas of Business Ethics Relevant to Animal Ethics**

Business ethics has not, so far, addressed concerns raised by animal ethics in much detail. As the interdisciplinary study of animal ethics grows, so too does the application of these views to business ethics and business practices (Wang and Chan [2017](#)). Some of the specific topics in business and professional ethics that relate to animal include social and corporate responsibility, concerns involving the commodification of animals and the exploitation of them and human laborers in related industries, as well as the development of codes of ethics and clear statements and disclosure of corporate policies related to the treatment of animals (Janssens and Kaptein [2016](#); Thomas [In Press](#)). For example, animal ethics raises the issue of whether or not animals should ever be commodified, and if so, if commodification is always or necessarily harmful to them. There have been many undercover operations that have exposed the cruel treatment of farm animals in some facilities, which has led to calls for the companies involved to be voluntarily transparent in their level of care towards their animals and their employees, and one way to do this is to provide clear statements of company values and how these are incorporated into guidelines and policies. This would also require that companies clearly identify their own position on animal ethics, regardless of where their views might lay along the continuum of beliefs about the moral value of animals and how they ought to be treated. Another aspect of social responsibility involves environmental sustainability, and as such, companies using animals can also better address such concerns for their stakeholders. Only by implementing effective social responsibility reporting related to the treatment of animals, humans and the environment can animal-related industries demonstrate their ethical commitments and actions to the public and their consumers. Finally, stakeholder theory has thus far mainly ignored the obvious issue of whether animals can be considered stakeholders. As animal

interests and preferences can be impacted in beneficial or harmful ways by the companies that use them, as well as those humans and organizations who advocate for them, it only makes sense that more developed applications and formulations of stakeholder theory should account for this.

## Summary

Entire industries exist solely to use animals for their body parts and their labor. Because such use causes harm and suffering to animals as well as the humans who work with them and in some cases care for them, animal ethics and business ethics are importantly tied together. Moral consideration for animals is increasingly being incorporated into business policies and practices, and many key issues in animal ethics pertain to the use of animals in business or to the indirect effects of economic activity on animals. As these fields are increasingly populated by interdisciplinary perspectives, a growing diversity of approaches to the ethical issues raised by the use of animals in business practices will provide new opportunities for businesses to improve their ethical stances toward animals and humans affected by their practices.

## Animal Rights and Business Ethics

John K. Lewis

Department of Management, United States Coast Guard Academy, New London, CT, USA

## Synonyms

Animal protection; Animal welfare

## Introduction

The topic of animal rights covers a broad spectrum of viewpoints. Many who speak of animal rights are actually concerned with animal welfare. Others seek complete animal liberation. Animal welfarists believe animals should be treated humanely and their pain and suffering should be limited as far as is possible. Extreme animal rights advocates believe animals are entitled to the same rights as human beings for man is just one type of animal different but no better than a dog, cat, pig, or tiger. Most animal rights advocates fall somewhere in a spectrum between these two viewpoints.

## Anthropomorphism

Throughout history most cultures have had an anthropomorphic view of animals. This philosophical viewpoint is human centered. Everything in the universe is placed there for the benefit of mankind. The environment and animals are only important as tools that can be used to improve the condition of human beings. Most religions particularly Western religions promoted this view. At best animal cruelty was reviled as being of bad moral character and contributing to depravity. There were exceptions to this human-centered ethos. Ancient Egyptians considered cats to be sacred. Other ancient religions worshipped certain types of birds, dogs, horses, cattle, and reptiles. Most famously, in Hinduism cattle are sacred. Hinduism promotes great regard for animal life partly because it is related to the belief in reincarnation. In many parts of India, pets are treated as family members. Buddhists also regard animal life as sacred. Many Buddhists are vegetarians so that animal lives are not harmed. In Jainism all forms of animal life are sacred. Many Jains carry brooms in order to sweep away insects and avoid stepping on them (Ahimsa 2019). Native American religions practiced animism – the belief that humans were connected to animals. Every human had a corresponding animal spirit. While Native Americans hunted, they did so only for

food and made sure to use every part of the animal as a sign of respect.

## Philosophical and Ethical Views

Animal rights have been dominated by two philosophical viewpoints – utilitarianism and the deontological view characterized by Immanuel Kant. There have been two primary animal philosophers who have dominated the field in the last 50 years – Peter Singer and Tom Regan. Singer is a utilitarian. Singer published the manifesto of the animal rights movement *Animal Liberation: A New Ethics for Our Treatment of Animals* in 1975 (Villanueva 2016). He challenged anthropocentric views of animals and revealed the horrors of factory farming and animal experimentation. Singer believes animals should be treated well not because they have rights but because they are capable of both suffering and enjoyment. Singer argues that because animals are sentient beings that are capable of feeling pain and suffering, they have “interests” which must be considered (Villanueva 2016). Failure to consider these interests is speciesism which is just as morally wrong as sexism and racism. While personally a vegetarian Singer believes animal suffering should be minimized to the greatest extent possible. The move toward pasture-raised beef and cage-free eggs is an outcrop of this philosophy. Organic and antibiotic-free meat and egg products also rise from this tradition. Singer’s main goal was to improve the conditions of intensively raised animals subject to factory farming methods (Villanueva 2016). Utilitarians believe in the greatest good for the greatest possible number recognizing that some animal husbandry and slaughter is necessary for the good of mankind.

The more extreme animal rights view can be characterized by the writings of Tom Regan. Regan published *The Case for Animal Rights* in 1983 which heavily influenced animal rights organizations, such as People for the Ethical Treatment of Animals (PETA). Extending the categorical imperative views of Kant, Regan believes that all animals have rights. Man as an animal has no more or less rights than any other animal. Regan

advocated for the total abolition of all use of animals in experimentation, all commercial animal agriculture, and all hunting and trapping (Regan 1987). Regan believed it is fundamentally wrong to view animals as a resource to be used for man's pleasure – whether for food or research purposes or exploited for sport or money (Regan 1987). Regan had little respect for animal welfarists; he wanted laws that would guarantee the rights of animals on a par with human beings. To Regan because animals are “subjects of a life,” they have equal inherent value with human beings (Regan 1987).

## Legal Rights

Animals have virtually no legal rights under current US law. The legal system has always regarded all animals, even beloved pets, as property. Under tort law the value of your pet dog or cat is related to its breeding. A purebred dog is more valuable than a mixed breed. There are no damages for pain and suffering or loss of consortium for the loss of a pet. In tort, recovery for the death of a pet is based on “fair market value” usually under a \$1,000 unless the animal has value as a breeder. In a few cases, judges have awarded damages for negligent infliction of emotional distress in egregious situations involving the loss of a cherished pet (Epstein 2001). However, this is a distinctly minority view in most jurisdictions. California recently passed a “best interests of the pet” law in divorce cases. Judges will award custody based on what is best for the animal rather than treating the pet as property (Gregorian 2018). Alaska and Illinois have similar laws. These are the only US laws that give animals, in this case pets, actual legal rights. Most states have anti-cruelty laws on the books covering any domesticated animal, but enforcement of these laws is almost uniformly lax and punishments weak. Most animal cruelty cases result in loss of custody of the animal and a small fine. Punishment with a jail term is extremely rare.

Despite the growth of factory farming in the United States, there are currently few federal laws regarding animal welfare. The Animal Welfare Act of 1966 does not regulate how animals are

used for research purposes, but only set standards for how they are obtained and maintained at research facilities. It also totally excludes farm animals from coverage under the Act. The Humane Methods of Slaughter Act of 1958 requires the proper treatment and humane handling of all food animals slaughtered in USDA-inspected slaughter plants but does not apply to poultry. The Endangered Species Act of 1973 protects fish, mammals, and birds – as well as plants – listed as threatened or endangered in the United States. Some states, including California, have passed ballot initiatives banning the use of “battery cages” for egg-laying chickens and gestation crates for pigs (Trusts and Hopkins 2013). Similarly voters in Massachusetts banned greyhound racing through a ballot initiative in 2008. California passed a law requiring all eggs come from free range hens in 2010. In 2016, Massachusetts voters passed a ballot question that will prohibit the confinement of pigs, calves, and chickens in tight quarters and prohibit the sale of meat and eggs from animals that have been confined. The law is set to take effect in January 1, 2022, and so far has withstood legal challenges from 13 other states (Schoenberg 2019). The trend at the state level is toward legislation that ensures animal welfare through humane treatment.

## Business Ethics of Food Animal Production

Since the end of World War II, the United States has moved from a system of diversified, local food animal husbandry on small family farms to a massive intensive system of factory production concentrated in the hands of a limited number of giant agro-businesses. This shift resulted in much lower food prices for the consumer but in much worse conditions for the animal raised for slaughter. Most consumers have little knowledge of the inhumanity of this production system, and most don't want to think about it or even to consider the ethics of eating animal flesh. While most American consumers favor ethical treatment of animals, the question becomes one of “willingness to pay.” In 1984, Simpson and Rollin investigated the

economic consequences of treating food animals more humanely. Virtually no decline would occur in total beef consumption if cattle feeding was moved from uncomfortable concrete lots to dirt lots as expense would be passed onto producers (Simpson and Rollin 1984). The authors found that consumers would pay 7–17% more for chicken meat if space for hens was to double (Simpson and Rollin 1984). The entry did not address willingness to pay but suggested that consumer purchases would be largely unaffected by such changes. A more recent study found that poultry produced humanely costs on average 15–20% more than factory-raised poultry (Adams 2008). The success of several companies in retailing cage-free poultry/eggs and pasture-raised beef suggests that there is a growing market for humanely raised food animals.

Schröder and McEachern (2004) found a strange disconnect between an individual's concern with animal welfare standards and their purchase actions. Consumers interviewed in the study believed animals should be treated humanely and that farming practices such as intensive confinement and caging were wrong. Outdoor and organic production methods were highly favored. However, when shopping, animal welfare considerations fell far below cost, freshness, color, and leanness in purchase determination (Schröder and McEachern 2004). Most consumers chose to suppress all thoughts about production systems and considered the purchase as an inanimate object rather than a once living being (Schröder and McEachern 2004). While this study was with UK consumers, most American consumers are similar preferring to either ignore the issues associated with meat consumption or pass the responsibility on to government regulatory controls.

As with factory farms, animal rights activists often focus their attention on the fast-food industry as one of the biggest contributors to animal suffering. Activists believe fast-food corporations have the greatest power to monitor animal welfare on factory farms and to use their purchasing power to improve conditions for food animals (Adams 2008). In response to such efforts, many fast-food producers have made pledges to treat

food animals humanely. For instance, KFC on its website pledges to “deal only with suppliers who provide an environment that is free from cruelty, abuse and neglect” (Adams 2008). Despite such pledges underground videos of shocking instances of animal cruelty on factory farms and slaughterhouses often are obtained and circulated by animal rights groups such as PETA.

The Pew Commission on Industrial Farm Animal Production was established in 2005 to study this system and to make recommendations for reform. The Commission examined the issue of animal welfare from a scientific, legal, and ethical point of view. The Commission found that the present system of producing food animals in the United States was not sustainable. Factory farming practices created an unacceptable level of risk to public health and caused environmental damage, as well as being inhumane to the animals raised as food (Trusts and Hopkins 2008). Animals were routinely kept in conditions that severely restricted movement. Natural behaviors were impossible, and animals often could not turn around or walk at all (Trusts and Hopkins 2008). Other factory farms raise huge numbers of animals in extremely confined areas. The Commission made 24 recommendations for reforming food animal production including:

- Banning use of nontherapeutic antimicrobials and antibiotics
- Improving disease monitoring and tracking
- Phasing out intensive confinement

In a follow-up report published in 2013, the Commission found these recommendations had been completely ignored at the federal level, with some small improvement at the state level, mostly on intensive confinement legislation and regulation. There had been little momentum except at the grassroots level for animal rights. Most legislative reforms were undertaken for the purpose of protecting agro-businesses from scrutiny, and positive industry changes mainly resulted from pressure from advocacy groups, especially in the form of state-level grassroots campaigns (Trusts and Hopkins 2013).

## Conclusion

Those concerned with animal rights and animal welfare have proposed measures that would treat animals, particularly food animals, more humanely. Animal scientists in Europe proposed principles to create basic animal welfare standards such as feeding regimens that do not create prolonged hunger or thirst, housing that ensures resting comfort, good thermal environments, freedom of movement, health management that limits pain and disease, and appropriate means for allowing the animal to engage in appropriate social and species-specific natural behaviors (Bonafos et al. 2010). Enactment of such standards and movement toward a system of smaller sustainable operations instead of factory farms would be the first steps toward granting animals natural rights.

The ultimate solution to the issue of animal rights, particularly with food animals, is a move toward vegetarianism or consumption of laboratory-created meat. No matter how humanely treated, the eventual result of raising animals for food is their slaughter. An average person living in a developed country who is not a vegetarian or vegan will consume approximately 7000 animals during his or her lifetime (McAfee 2015). Meat, poultry, and dairy farming is responsible for 8–10% of greenhouse gas emissions worldwide (Thornton 2019). The production of just 1 pound of beef requires the consumption of 7 pounds of corn (Lavelle and Garber 2008). A shift to vegan diets would free large stores of plant proteins currently consumed by animals for human consumption (Pluhar 2010). For those who still prefer the taste of animal flesh, the void may be filled by laboratory-created meat. If widely accepted, laboratory-grown meat could eliminate much of the cruel, unethical treatment of animals raised for food (Schaefer 2018). Several companies are heavily investing in the production and retail sale of plant-based meat substitutes. It is quite possible that in only a few generations, humans will look back on current meat-eating practices with disdain as they dine solely on plants and lab-grown flesh.

## Anonymity, Confidentiality and De-identified Data

Martin Tolich  
University of Otago, Dunedin, New Zealand

### Introduction

Anonymity is defined in the Oxford English Dictionary as “of unknown name, unknown or unclear sources or authorship, without character, featureless, impersonal.” However, within the social sciences, the concept of anonymity can have a less absolute interpretation allowing for a person's identity to be disguised by pseudonyms. Some research council funding policies encourage this practice by mandating the storage of anonymized data for future unspecified research. Yet qualitative research data can only be stripped of identifiers; it cannot be anonymized. To understand the difference between an unknown anonymous source and a disguised confidential source, it is important to consider four nuances of data collection; first, how differently the process of informed consent is enacted in quantitative and qualitative research; second, while the concept external confidentiality appears in ethical

guidelines, its inverse internal confidentiality does not, for example, the failure to recognize the practicalities of confidentiality in focus group research makes their participants vulnerable; third, the use of pseudonyms in qualitative research is the source of many historic ethical breaches; and fourth, subpoena of data threatens confidential data only.

### Informed Consent and Anonymity

In quantitative data collection, a participant information sheet may advise participants that completing a questionnaire will imply informed consent. As there is no written consent form to reveal the participant's identity, data provided to the researcher comes from an unknown source, and so in this context, anonymity can be a watertight ethical assurance. However, this assurance has caveats; it assumes the data collection instrument acquires no unique identifiers such as the subject's name, social security number, or driver's license number. Also if the survey sample size is small in number or based on a region or an occupation, demographic questions can threaten to expose the identity of participants and disclosure of their data. For example, a questionnaire asking military personnel to provide their rank, gender, and theaters of war served may identify the very few females in the military's upper echelons.

Qualitative researchers do not, for good reason, have the same assumed consent process. Not only may qualitative researchers provide an information sheet, but they also routinely ask participants to provide their identity by signing a consent form to demonstrate their willingness to accept the ethical provisions offered by the researcher. Anonymity is not a valid provision as at least one other person, the researcher, knows the identity of the person and what the person said. This knowledge can never be unknown, and offering this ethical surety is ethically flawed, promising a participant something that cannot be achieved. Many researchers claim when reading a transcript decades after the interview they can hear the informant's voice. The original ethical assurance

to this person to disguise their identity and what they said endures.

The definition of confidentiality is simple: it refers both to the identity of the person and the information disclosed. The researcher knows the name of the person being quoted and promises not to tell other persons the identity of the person when reporting this information. However, there is a major relational caveat manifest as internal confidentiality can undermine this assurance; this stems from other participants sharing a relationship to the participant interviewed.

## External and Internal Confidentiality

The distinction between external confidentiality and internal confidentiality reveals a major threat to confidentiality in qualitative research ethics. External confidentiality is traditional confidentiality: the researcher knows the name of the person who said the quote and what they said but promises not to tell other persons the identity of the person when reporting this information (Tolich 2004). This assurance can be undermined relationally. If a researcher interviews friends of the participant, family members, fellow workers, or a member of their small town, the threat to confidentiality is sourced not by strangers but fellow residents, occupants, or workers. Each of these can identify themselves and by default others.

Internal confidentiality is endemic in focus group research. Focus group researchers cannot offer participants internal confidentiality because it is outside of their control: the researcher can place few restrictions on focus group members. There is no ethical sanction on a participant should they reveal outside the focus group what was disclosed by another focus group member. Thus, promises of confidentiality must be limited to external confidentiality, that is, that the researcher will not identify any participant or what they said in any publication. Yet external confidentiality cannot limit focus group members from repeating other participants' disclosures to a person outside the group. It does not matter if the participants are known to each other or strangers. Both are problematic and render participants

vulnerable susceptible to harm from internal confidentiality. It makes sense if the participants were informed of their responsibilities and these limitations. At least the participant would know his or her own role in the minimization of harm.

In comparison, focus groups pose more distinctive ethical problems than one-on-one interviews. A participant in a private interview has opportunities to withdraw a remark during the interview or sometimes, if the participant reads an interview transcript, they can delete the remark. In focus groups verbal statements cannot be taken back and harm may result from the limits of internal confidentiality. Thus to use the word confidentiality without clarification may be taken as offering a layperson more than the concept can deliver.

## Historical Ethical Breaches

Breaches of internal confidentiality are not uncommon in qualitative sociology and anthropology. Street Corner Society (1981 [1943]), William Whyte's seminal text, is a case in point. In Whyte's original text, he gave pseudonyms to the region (Cornerville) and its inhabitants (e.g., "Doc"), to protect external confidentiality. The appendix of his 1981 edition captures the everyday world of doing ethnographic study, but also provides an insight into the harm caused by breaches of internal confidentiality. Participants told Whyte about how insiders recognized themselves and other insiders in the text:

Pecci (Doc) did everything he could to discourage local reading of the book for the possible embarrassment it might cause a number of individuals, including himself. (1981, 347)

Despite promises of external confidentiality, when his participants read the book, they saw themselves and those close to them.

A similar case of a publication reporting an anthropological study in a rural US town caused anger and dissension among those whom they have studied. Muchmore (2002, 10) reported:

When the [anthropology] book was published, many townspeople were highly disturbed to see

some of the most intimate details of their lives recorded in print. Even though the author had attempted to protect his informants by using pseudonyms, their true identities were easily recognizable to anyone familiar with the area. Fifteen years later, another anthropologist who visited the town was surprised to discover that the local library's copy of the book had the real names of all the individuals pencilled in next to their pseudonyms. Even after all those years, some of the community members were still visibly upset about the ways in which they had been portrayed.

When Scheper-Hughes returned to the site of her 1979 study of the mental health in an isolated Irish village, she found villagers had deciphered her attempts to provide pseudonyms as ethical assurances. She described her use of pseudonyms as ineffective:

I would be inclined to avoid the 'cute' and 'conventional' use of pseudonyms. Nor would I attempt to scramble certain identifying features of the individuals portrayed on the naive assumption that these masks and disguises could not be rather easily de-coded by villagers themselves. (2000, 128)

What Whyte, Munchmore, and Scheper-Hughes graphically expose is that pseudonyms cannot make the known unknown. They are especially ethically weak solutions for qualitative researchers when the sample interviewed is relational.

### **Are Pseudonyms a Genuine Ethical Assurance?**

Saunders et al. (2015, 617) claim "anonymity" has commonly been used either interchangeably with or conflated with "confidentiality." They muddle the known and unknown stating "anonymity is one form of confidentiality – that of keeping participants' identities secret." The essence of this confusion is mistakenly separating the identity of the person and the information they shared. Once collected, qualitative data is known, and by virtue of that fact, it cannot be unknown. This finding is important as it is out of step with policies on data archiving that tie funding for qualitative data collection to its archiving for future unspecified research.

The Economic and Social Research Council guidelines in the United Kingdom promote the archiving of data and tie funding to a practice that is inherently not risk-free for qualitative researchers. For example, the British archive collective Qualidata (Corti et al. 2000) with over 7 years' experience anonymizing datasets and preparing qualitative data for archiving state:

Anonymisation of data is a traditional option used for removing identifying information or disguising real names. ...The key issue here is that it is important to arrive at an appropriate level of anonymisation to ensure that data are not distorted to a degree which lessens their potential for reuse.

Yet once confidential data is collected, it cannot "nearly be made" anonymized. At best the data can have identifiers removed. In fact, de-identification proves a more practical and a more ethical term for qualitative researchers especially in the storage of data. A definition of de-identified data would be data given to another researcher or stored in an archive after any identifiers had been redacted from the data. At no time should a qualitative researcher promise participant's anonymity. The term anonymity has to be used in its dictionary sense when discussing consent with participants to collect qualitative data as that is how they will understand it. In other words, there are limits to confidentiality, and these are exposed below within focus groups and by the threat posed by a subpoena.

### **Subpoena**

Any subpoena served on a quantitative researcher would compel the researcher to provide raw data to law enforcement officials knowing any respondent is protected by anonymity. This adheres to the statement that filling out this questionnaire implies informed consent which does not identify the respondent or what they said. The researcher and the respondent are protected from the subpoena as the researcher does not know how each individual respondent responded to the questionnaire. On the other hand, the qualitative researcher is vulnerable given their awareness of the limits of confidentiality, not only in terms of internal

confidentiality but also that failure to provide data following its subpoena would expose researchers to a charge of contempt of court given that they know both the identity of the informant and what each individual said.

In sum, clarity of ethical concepts is essential. Researchers cannot offer participants ethical assurances of both confidentiality and anonymity interchangeably, as if the double assurance were better than one. It is not; the concepts of anonymity and confidentiality are mutually exclusive especially in terms of the distinct informed consent process. Once quantitative data is collected, the relationship between the researcher and the respondent is ephemeral. However, the relationship between the qualitative researcher and their informant endures. There are limits to confidentiality for qualitative researchers. Internal confidentiality for relational informants makes them vulnerable, so too does the use of pseudonyms to make data unknown. These limits are exposed in focus group research where membership creates relational problems; the researcher may promise external confidentiality, but they have no control over what the other participants say after data collection. Finally, the threat posed by a subpoena for any qualitative researcher demonstrates a fundamental difference between ethical assurances of anonymity and confidentiality.

## Synonyms

Business ethics education; Integrity education

## Introduction: The Context of ACE

ACE is a subset of *business ethics education* (BEE). Most of the issues discussed under that entry form the base of ACE as a specific, applied field of BEE. Almost all the dilemmas educators face in the field of BEE pertain to AC educators. The central dilemma is whether to follow a value-based education or an instrumentalist approach. Thus ACE can also rely predominantly on the application of moral philosophy with value judgments or on the application of legal and compliance driven governance theory with utility calculations. The moral approach refers to a philosophical framework or a religion or social norms; the instrumental approach refers to rational calculation of benefits.

In the context of a *moral philosophy* centered ACE, corruption is defined as inherently bad and immoral and the individuals and the firms are positioned as moral agents. The applied moral philosophy can be universalist or particularist: the former operates with universally binding principles, the latter emphasizes that ethics and moral judgments are rooted in the individuum; or

relativist, emphasizing the role of local cultures that determine very different perceptions of what is right and wrong (cf. Olsen 2010, p. 157). In the context of an *instrumentalist* approach-based ACE, corruption is defined as a market failure and/or public policy failure and the individuals and the firms are positioned as performers of law-imposed minimal compliance (when not complying harms the individuals and the firms). Both approaches are normative: The moral approach requires you to do it [i.e., anti-corruption] because that is *right* and/or *good*; the instrumentalist approach requires you to do it [i.e., anti-corruption] because that is *useful* (cf. Jones 1996; Fleming and Jones 2013; Frederick 2006).

The choice significantly influences both the ways ACE is organized and the approaches to *what* and *how* to teach. ACE is part of a complex system that includes business, governmental, and other nonbusiness drivers such as an increasingly globalized market economy, national and international formalized legal systems, institutional and administrative governance structures, formal and informal social and cultural factors, including educational systems.

This complex system has several spatial and temporal variations that generate further challenges and require the continuous review of ACE. Some of the most important variables are the following:

- The changing business-and-politics interface: The impact of globalization on business education
- Market instruments for regulating international business activities, including international standards and voluntary best practices
- Political influence on business and markets: international treaties and regulations and the emergence of global anti-corruption norms

## The Purpose and Starting Points of ACE

ACE is aimed at preventing and/or solving the problems and distortions generated by corruption. As corruption reduces growth and increases inequality, ACE ultimately influences the macro-economic effectiveness of business and politics

(cf. Mauro 1997 in Elliott 1997). Its main implicit presumption is that education is a necessary (though not sufficient) condition for eliminating (or, as a minimum, reducing) corruption. Thus the first starting point for every form of ACE is the *analysis of corruption* and the understanding of the distortions and perceived damages it causes in business and society. Effective ACE is impossible without a thorough understanding of the causes, institutions, and mechanisms of and motivations for corruption. ACE is one of the responses to the need for countering the challenges of corruption that “reach far and wide,” to the “scale of the problem” and to its harm to “established and trusted relationships” (Amann et al. 2015, pp. 1 and 2). In the narrower sense of ACE in business schools, corruption is considered a serious impediment on business transactions and a leveled playing field. “The point on transparency and predictability is particularly important. Time and time again, we see that while at certain points in time corruption may help resolve individual transactions, once it becomes institutionalized, companies suffer because it is impossible to predict how markets will work. In other words, in a corrupt environment, it is impossible to predict how a legislation will be enforced, who will make decisions, and why certain decisions will be made. How can you plan your business activities and decide on resource allocation and investment in such an environment?” (Olsen 2010, p. 154).

The second starting point in ACE is the definition and analysis of *anti-corruption* in order to design appropriate and efficient strategy and content for ACE. The analysis of corruption helps define the appropriate forms, mechanisms, and efficient tools of anti-corruption activities. Anti-corruption is defined as “the opposition to or prevention of corruption” (Collins English Dictionary) or as an activity “designed to eradicate or prevent dishonest or fraudulent conduct” (The Oxford Living Dictionary). The UN Convention Against Corruption defines the purpose of anti-corruption activities primarily as prevention and punishment. A central objective of every kind of ACE is prevention: “To promote and strengthen measures to prevent and combat corruption more efficiently and effectively... To promote,

facilitate and support international cooperation and technical assistance in the prevention of and fight against corruption.” Additionally, it defines the purpose of these activities as “to promote anti-corruption, accountability and proper management of public affairs and public property” (UNCAC 2004, Article 1); and punishment by the criminalization of corrupt practices and effective law enforcement: [The Parties] “shall adopt such legislative and other measures as may be necessary to establish as a criminal offence, in accordance with its domestic law, participation in any capacity such as an accomplice, assistant or instigator” in corrupt activities (UNCAC 2004, Article 27).

ACE’s purpose is to improve the preparedness of managers to better, more “effectively cope with the challenges of leading with anti-corruption in a global stakeholder environment” (Amann et al. 2015, op. cit. p. 28).

The third starting point of ACE is that here is an ever-growing global demand from the public, private, and nonprofit sectors for practitioners and business managers who are well equipped with necessary knowledge, skills, and values to effectively counter the harms and negative impacts of corruption.

## The Basic Assumptions of ACE

Anti-corruption strategies have several assumptions, most notably one that anti-corruption needs a universally applicable strategy, consequently it is possible to develop a similar ACE strategy and general content globally. This assumption reflects an institutionalist approach by raising and answering to the question “whether it makes sense to assume a homogenous kind of rational and strategic action across cultural settings” (Hall and Taylor 1996). Hence there is a need for an overarching framework for ACE that is capable to organize the increasing knowledge on anticorruption, synthesize the rapidly growing experiences and best practices worldwide (cf. Lambsdorff 2007, p. 225). An addition to this assumption is that broad based mass education and the specific targeted ACE are the right

tools for reducing and/or eliminating corruption (cf. Uslaner and Rothstein 2012).

The possibility for leveling the playing field by anti-corruption education is another basic assumption. The importance attributed to the leveling the playing field reflects a liberal interpretation of the economy where free competition and equal entry conditions determine markets. Corruption is perceived as an intervention into the free market that distorts fairness and equal entry conditions (OECD 2014). A further assumption is that leveling the playing field also depends on leadership approaches. “The human factor is perhaps the greatest challenge to leveling the playing field in the global marketplace. Until management sets the right tone at the top and is willing to stay the course when others do not, we will continue fighting an uphill battle” (Olsen 2010, p. 158).

## ACE Frameworks

The need for an overarching framework in ACE is further supported by the fact that in a globalized economy business practices and accounting principles are becoming increasingly uniform (Olsen 2010, p. 157). At the same time, the emergence of global anti-corruption norms also strengthens the argument in favor of a globally applicable ACE framework. Major international organizations such as the UN, the World Bank, and OECD have legal and policy instruments to combat corruption. The information revolution and the emergence of new forms of social interactions and the social media contributed to “wide-spread diffusion of new information about the causes and costs of corruption, as well as strategies to combat it” (McCoy and Heckel 2001, pp. 86–87). New international educational institutions have been established, offering curricula to a global audience, see the International Anti-Corruption Academy (IACA) and its mission (IACA <https://www.iaca.int/master-programmes.html>).

A global ACE framework has several advantages, such as addressing global problems with the flexibility and adaptability to local conditions; selection of effective materials; inspiration for creating new, locally relevant content; and helping

“aligning... course objectives, content and pedagogy in the context” (Amann et al. 2015, p. 65) of anti-corruption. As ACE is part of the general management and leadership education, its framework can rely on and incorporate the insights gained in studies on motivations and learning (cf. Eccles and Wigfield 2002). When designing an ACE framework, educators can consider that the learning outcome be relevant to the context while the knowledge and skills to be taught be selected to that purpose.

Several international organizations, particularly OECD, Principles of Responsible Management Education (PRME) of the UN Global Compact, and the UN Convention Against Corruption, provide materials and methodology for ACE.

### **Multi- and Interdisciplinary Approaches in ACE**

There is a general agreement on the importance of multidisciplinary and interdisciplinary approaches in ACE because knowledge from different disciplines can allow for a more holistic understanding of corruption and anti-corruption strategies (Cotton and Alcock 2012). ACE needs a holistic perspective that includes a multidisciplinary approach (using material from business, economics, law, anthropology, sociology, and political science) and a bottom-up perspective. This perspective focuses on real needs of managers and leaders that spread over the different market, political, legal, and sociocultural environments.

ACE curricula may integrate the institutional level (faculty, university), the curricular level (course design, modules), and the instrumental level (specific methodologies) in order to create significant learning for students and generate a synergic and holistic effect on students' acquired knowledge, not only in terms of competences but also in terms of attitudes (Setó-Pamies and Papaoikonomou 2016, p. 525). Those who emphasize the importance of ethical education use a similar though distinct argument: “The nature and value of the anti-corruption capacity construct ... and its four dimensions – process, judgment, developmental and system anti-corruption capacities ... [help businesses] ...

better handle behavioral, moral and legal complexity and thereby promote moral progress in business domestically and globally” (Petrick and Quinn 2000).

### **Modular Structure**

The most effective anti-corruption curricula are organized in a modular structure that ensures instructors the flexibility and the application of the best quality content in teaching modules on anti-corruption. Two rationales justify the choice of a modular outline. First, in order to cover as many of the different topics that characterize the complex fields of corruption and anti-corruption, the adoption of a series of modules, arranged as core courses and electives in degree education or as different training blocks in nondegree education, seems to be the optimal solution. Secondly, the regional specificities of anti-corruption actions require a satisfactory degree of case studies and literature specialization on different regions. This could be, again, best achieved through a modular system.

### **Content of ACE**

The significance of ACE in degree (particularly in MBA) and executive education curricula has considerably increased in the twenty-first century. The many facets of ACE require both a multidisciplinary approach and a changed content. The most recent anti-corruption curriculum frameworks situate anti-corruption issues at the interface of the macroenvironment within which any business operates and the microenvironment inside the firm. The macroenvironment defines the different economic, legal, political, and policy issues influencing anti-corruption. It is also responsible for the social and cultural diversity of the interpretation of anti-corruption.

The microenvironment represents the management challenges for the firms and their leaders and defines leadership approaches, corporate culture, compliance systems, and the importance of risk assessment against corruption. Anti-corruption curriculum frameworks are designed as tools for

leveling the playing field, with lessons learned and recommendations for countries of emerging and transition economies as well as highly developed economies.

### Typical Course Topics in ACE<sup>1</sup>

Part of the ACE covering the macroenvironment (extra-firm areas) that determine the context within which firms operate typically includes courses discussing the following issues:

Political, policy, and legal environments of markets; the social and cultural dimensions of global management; and behavioral root causes of fraud and corruption.

Other courses covering the microenvironment (intra- and interfirm areas) that determine the activities of the firms deal with the following issues:

Legal and market instruments in controlling corruption and/or laws governing corruption; how to build an anti-corruption culture at a company; the role of corporate governance in controlling corruption; managing corruption risks in business transactions; compliance systems and enforcement.

Finally, a set of courses may cover the interface of public and private sectors, focusing on issues like:

Corruption and controlling corruption; collective actions against corruption; coordination of public and private interests.

These topics can be presented in the following matrix (Table 1) showing the relationship between the context of anti-corruption and course disciplines.

Another matrix (Table 2) presents the modular conversion of topics, showing the relationship between the nature of relevant norms and the locus of activities/transactions.

### Integrated Approaches

Educators emphasize the need for a three-level analysis in ACE: the institutional (faculty,

university), the curricular (course design, modules), and the instrumental level (specific methodologies). This approach allows to generate a synergic and holistic effect on students' acquired knowledge, "not only in terms of competences, but also in terms of attitudes" (Setó-Pamies and Papaoikonomou 2016).

### Business Relevant Materials in ACE

Availability of materials in degree and nondegree education and for company actions and trainings is an important factor in effective ACE. Text books, case studies, online and multimedia materials, training materials, handbooks, toolkits, web-based materials, videos, movies, blogs, etc. are all parts of the ever broadening offering. Materials relevant in ACE for business also include compilations of international business principles on countering corruption and bribery, compilations of anti-corruption codes of conduct and compilations of international and national anti-corruption laws, and compilations of case studies.

Course and training materials can rely on the following sources:

Text books, case studies, online and multimedia materials, training materials; handbooks; toolkits; best practice examples; compilation of international business principles on countering corruption and bribery; compilation of anti-corruption code of conducts; compilation of international and national anti-corruption laws; other Web-based materials (e.g., nonprofits' anti-corruption education websites); videos, movies (e.g., <http://ethicana.org>); materials prepared by agencies and organizations specialized on anti-corruption issues (e.g., Transparency International <http://www.transparency.org/topic/detail/education>; Open Society Foundation <https://www.opensocietyfoundations.org/voices/world-s-most-corrupt-university-system>; and anti-corruption resource centers, e.g., <http://www.u4.no>); internationally supported local educational projects against corruption (e.g., <http://www.sdcentras.lt/antikorupcija/en/tp1.htm>); blogs (e.g., <https://educationpolicytalk.com/2014/05/06/anti-corruption-education-to-be-or-not-to-be/>);

<sup>1</sup> The course topics listed here are drawn from existing courses at different universities/business schools rather than quoting existing course titles.

**Anti-corruption Education, Table 1** Context of anti-corruption course topics

| <i>Context of anti-corruption courses</i>  |                                                                    | <i>Course disciplines</i>                                                                                                                                                                                                                 |                                                                                                                                                                                      |                                                                                                                                                |                                                                                                  |

best practices (e.g., [http://www.nyc.gov/html/ia/gprb/downloads/pdf/NYC\\_Anti-Corruption%20Educational%20Campaign.pdf](http://www.nyc.gov/html/ia/gprb/downloads/pdf/NYC_Anti-Corruption%20Educational%20Campaign.pdf)); and business offerings (numerous, including general consultancies such as Ernst and Young [http://www.ey.com/Publication/vwLUAssets/Building\\_an\\_anti\\_corruption\\_program/\\$FILE/Building\\_an\\_anti\\_corruption\\_program.pdf](http://www.ey.com/Publication/vwLUAssets/Building_an_anti_corruption_program/$FILE/Building_an_anti_corruption_program.pdf), specialized training firms such as GAN International <http://www.business-anti-corruption.org/tools/training.aspx>, law offices, etc.).

One of the most comprehensive sources of teaching materials and methodologies is the UN PRME source book: *Anti-Corruption:*

*Implementing Curriculum Change in Management Education* (Amann et al. 2015, op. cit.). It provides comprehensive guidelines on how to professionalize ethics and anti-corruption education worldwide in a variety of classroom settings. It includes successful patterns and illustrative case studies and helps adapt and develop best teaching practices. Other PRME-inspired ACE teaching materials are Stachowicz-Stanusch and Hansen (2013) and Sunley and Leigh (2016).

A further major source is OECD's educational and training materials: *Anti-Corruption Ethics and Compliance Handbook for Business* (OECD-UN ODC-WB 2013).

ACE Methodologies

Methodology is important to determine how to achieve the goals of and how to teach in ACE. There is a broad variety of methods, such as traditional methods (lectures and seminars, guest presentations) and methods that apply new pedagogical tools such as the application of simulation and situation games, action learning, online teaching methods, etc. Despite the variety of methodologies, ACE is based on the assumption that, similarly to a globally applicable and relevant content, certain methodologies that have a key role in ACE are also applicable globally. These methodologies can be jointly developed by instructors and scholars with significant experience in ACE. The most relevant example for such an effort is the activity of PRME (Principles of Responsible Management Education), an initiative of the UN Global Compact. PRME established a Working Group on Anti-Corruption in Curriculum Change with an international team of business school faculties (UN PRME 2008) that, over a period of several years, prepared an anti-corruption toolkit for global use in ACE and published it in 2013 (UN PRME 2013).

Financial and Institutional Arrangements for ACE

Education to affect corruption can be publicly or privately financed and is to affect private and

public agents (players in business, politics, and administration). The purpose and content of anti-corruption education will vary accordingly. Some of the most significant institutional players that support ACE are the OECD, the UN Global Compact and its PRME initiative, and development banks.

Businesses may have an interest in ACE and play a role in financing it through trainings, by developing teaching materials and support business schools in their ACE programs.

A special case of financing ACE is the *Siemens Integrity Initiative* (Siemens 2009). As a settlement with the World Bank in 2009, after its infamous bribery case, Siemens AG agreed to establish a special fund in the amount of US\$ 100 million to support anti-corruption education and collective actions over a period of 15 years. Roughly one fifth of this fund is to be devoted to support ACE. The Siemens Integrity Initiative has had a role in strengthening institutional arrangements for ACE by supporting PRME, Transparency International, and the International Anti-Corruption Academy (IACA), among other players.

There is an increased interest among donors in funding civic education to build corruption awareness and civic virtue in schools. These efforts can be seen as both one-off and supporting wider institutional reform (cf. Marquette 2007). One example is the World Bank Institute’s Youth for Good Governance Learning Program within its

broader Governance and Corruption Program that also emphasizes that donors see this sort of education as “key” in fighting corruption (World Bank Institute 2006).

## Impacts of ACE

Research has demonstrated a positive relationship between education and political knowledge at the individual level, but it does not support this relationship between aggregate education and corruption (cf. Eicher et al., op. cit.). ACE may not have a major impact on grand corruption undertaken by political elites that implement policies to foster their own utility, either through misappropriation or distorted allocation of public funds (Eicher et al. 2009), but it may affect areas and institutional arrangements where corruption is most prevalent and where corrupt transactions are arranged. The impact of anti-corruption research and education is seen in changing the particular institutional design that is employed for carrying out corrupt transactions at projects of major development banks, in particular at the World Bank’s anti-corruption efforts. “Substantive reforms ranging from a new staff rule ... to the formal calculation of corruption risk in loan appraisal documents offer realistic ways to strengthen the anti-corruption efforts of the World Bank” (Chanda 2004).

The positive impact of ACE is expected to be seen in the emergence of a new generation of management that is trained and assigned to identify the risks of corruption and steer organizations around the pitfalls of doing business in corrupt environments (Olsen 2010, p. 159).

## Apartheid and Ethics

David Coldwell

South Africa

## Synonyms

Afrikaner political system; Nationalist government; Racial discrimination; Racial segregation; South Africa

## Introduction

The Merriam Webster dictionary (2016) defines apartheid as “racial segregation; specifically: a former policy of segregation and political and economic discrimination against non-European groups in the Republic of South Africa: separation, segregation (cultural apartheid), (gender apartheid).” Gender/sexual apartheid is defined by Chesler (2011, p. 6) as “practices which condemn girls and women to a separate and subordinate sub-existence and which turn boys and men into the permanent guardians of their female relatives’ chastity.” Cultural apartheid is more amorphous and can take various forms such as sport, school, and university segregation on racial, ethnic, or religious grounds.

The term apartheid is of South African Afrikaans origin and means “separateness”; the “state of being apart” was a socio-political-legal system of racial segregation in South Africa implemented and enforced by the National Party from 1948 to 1994. However, although of recent origin in South Africa, the practice was, and is, not unique to that country.

Varieties of racial, gender, and cultural/ethnic separateness and segregation have a long human history. For example, an early form of cultural/ethnic apartheid emerged in England in the seventh and eighth centuries between the Anglo-Saxon invaders and Welsh Britons. Thomas et al. (2006, p. 2) indicate that “In Anglo-Saxon England, elements of an apartheid-like society can also be perceived in a Wessex law code of the seventh century which distinguishes clearly between Saxons and ‘Welsh’ (Britons) and gives the former a significantly higher legal status, some two centuries after the initial immigration.” Genealogists have also suggested that the lack of DNA evidence in the current English population of the Danish Viking invaders from the population of what then constituted the Danelaw was because of a lack of intermingling between the two groups on the basis of social exclusion.

More recently there is an example of ethnic apartheid from the uniquely horrific case of systematic genocide on a vast scale, perpetrated by the Nazi German state on the racist premise that

Jews constituted an inferior race that Nazi Germany wished to expunge from the face of the earth. Racial apartheid can also be seen to exist in segregated communities to this day, such as on reservations provided for indigenous people (Canadian Indian Act, 1876) and aborigines of Australia (Steadman 2014), respectively, where indigenous groups who were granted aboriginal “status” were given free access to living in segregated communities. It would be wrong, therefore, to suggest that South Africa which provides the most infamous modern-day example was unique in this respect. Today, various forms of apartheid exist throughout the world in the form of gender apartheid where women are regarded as separate and inferior to men in many parts of the world and are denied equality of opportunity solely on the grounds of their gender. Similarly, ethnic separateness exists today in Israel between Palestinians and Israelis which is strongly, and sometimes violently, enforced by the Israeli state and where the Palestinian community is separated off from the main social and legal structures accommodating Israeli Jews. Likewise in Africa, there have been recent examples of ethnic and cultural separateness resulting in gross injustices and violence. For example, the Rwandan genocide in 1990 that resulted in approximately 800,000 Tutsis (and a significant number of Hutus sympathizers) being slaughtered in a carefully orchestrated program of genocide over 3 months and compounded by the rape of quarter to half a million women over the same period. Also in Europe, the Bosnian war between Serbia and Croatia provides a further recent example of cultural/ethnic apartheid and its unethical consequences of brutal violence and insurrection.

The above examples are merely a small number of the evils of apartheid and apartheid-like policies and cultural beliefs in human history but serve to illustrate that apartheid in substance if not name was not a unique sociopolitical institution of South African design and origin. South Africa does, however, provide a very recent example of the unethical outcomes perpetrated by this system of legal, political, and social exclusion. In any event, apartheid in South Africa deserves a brief

discussion at this juncture because of its recent occurrence, demise, and moral reprehensibility.

## **A Brief History of Apartheid in South Africa**

South African racial segregation dates back to Dutch colonial times and was then taken up by the British in 1795 when they conquered the Cape of Good Hope. The actual sociopolitical implementation of apartheid occurred after the Afrikaner government came to power in 1948. The apartheid system categorized the various populations of South Africa into four main groups: Black, White Colored, and Indian, with Colored and Indian racial classifications being further subdivided into subgroups such as Cape Malay and Cape Colored and Muslim Colored. Residential segregation was initiated systematically by forcibly removing around 3.5 million nonwhite people between 1960 and 1983 into specially designated areas allotted for this development. The Afrikaner national government also segregated secondary and higher education facilities, medical care, and other public services and amenities. Apart from spatial segregation, the nonwhite population was deprived of political representation in 1970 and stripped of their South African citizenship and became citizens of ten, tribally defined and ostensibly self-governed, Bantustans, four of which were nominally independent. The injustices of the apartheid system led from 1950 onwards to various forms of protest, strike, and violent guerrilla activity. These actions resulted in national government action involving house arrests and full incarcerations of anti-apartheid leaders. There was a progressive escalation of various forms of insurrection and repression over time that reached a climax with the Soweto Riots caused by the requirement to learn Afrikaans in Black schools. However, the main threat to the apartheid state came not from internal revolt or military incursion but from economic and political isolation. Economic sanctions and trade embargos largely instigated by Western governments made it increasingly difficult for the White National Party government to survive. In

1990, President De Klerk and large segments of South African industry, perhaps most notably, the mining industry, on which White South Africa was most economically dependent, became involved in a series of meetings and negotiations with the African National Congress (ANC) under the leadership of Nelson Mandela. Mandela himself and various other political leaders, who had been incarcerated in Robben Island prison for decades, were released by De Klerk in 1989. The official legal-political abolition of apartheid occurred in 1991 with the repeal of the last of the remaining apartheid laws, and nonwhites were given the vote for the first time in 1993.

The first nonracial democratic elections in South Africa were held in 1994 in which the ANC won an overwhelming majority of the vote and finally brought to a close a violent and unjust period in South African history.

## The Ethics of Apartheid

It may seem odd that apartheid could have an ethical justification in any shape or form, but like the SS of Nazi infamy, there were certain propagated beliefs/doctrines or attitudes among the community that tried to give terror and injustice an ethical face and rationale. As is generally known, the Nazi SS (*Schutzstaffel*) were entrusted by Hitler to put in motion his plan for the complete extermination of Jewish people from Europe. The SS were left to implement this, and in practical terms to herd, perfectly innocent Jewish men, women, and children into the gas chambers designed to destroy them in the shortest time possible. Despite this, within the SS, there was a strong code of behavior that strongly sanctioned various forms of commonly regarded ethical behavior such as prohibiting theft from Jewish victims for personal benefit. Kay (2016, p. 79) quotes Heinrich Himmler in a 1944 speech made to a group of SS generals as stating, "We had the moral right; we had the duty to our people to kill these people who wanted to kill us. We do not have the right, however, to enrich ourselves with even one pelt, with one watch, with one Mark, with one cigarette or with anything else."

Furthermore, this "moral code" was enforced and severe punishment meted out to those who transgressed at lower levels in the SS hierarchy, although corruption in the SS was a widespread fact. The SS brotherhood was indoctrinated to believe that they were "blessed" among people to be chosen to do this macabre but necessary duty in service to Nazi Germany. Schroer (2012, p. 38) relates the perspective of SS officer, Karl Kretschmer, who "saw himself as a representative of a cultured people fighting a primitive, barbaric enemy."

In South Africa, there were similar religious appeals to justify the apartheid state on grounds of certain specific biblical passages that seemed to warrant Black segregation. From these religious premises, and others like it, the idea of ethical racial segregation impacted the manner in which business and industry were designed and structured. It was said, for example, that Verwoerd, sometimes regarded as the architect of apartheid, is reported to have said in a speech (Venter 1999, p. 418), "We shall not act unfairly in any way. We shall not allow our understanding to let us down. For a leader who has to take care of a people ('volk'), cannot govern, driven by emotions or vengefulness. It is our task in these heavy times, while the heart often wants to speak, to let understanding dominate; understanding and faith."

## Business Ethics and Apartheid

The impact of ethics on South African business during the existence of the apartheid regime was virtually nonexistent. For example, certain, usually, higher paying jobs were not open to nonwhites and the national government to ensure that its voter base was kept intact and used a process of job reservation which benefited less well-educated section of the Afrikaner population. Job reservation was a technique enforced by law (Mines and Works Act, 1912 and the Mines and Works Amendment Act, 1926) which reserved certain jobs to Whites only. In the South African mining industry, one of the largest employers of Black unskilled and semiskilled workers at that time, only the lower paid jobs

were open, and promotion was restricted to team leader level that approximated that of a technical supervisor in general industry. Blacks were not allowed “blasting certificates” which effectively debarred Blacks from further promotion beyond the supervisory level. Like the notion of no taxation without representation, it became clear that there could be no ethical business in an unethical society. From the late 1980s to the early 1990s, as trade and embargoes became progressively tighter, the already poor state of ethics in business worsened further. South African corporations now found themselves debarred from participating in the world economy and, as a consequence, tried to find other, usually immoral and illegal ways of sanction busting. This led to a climate in which illicit business practices were encouraged by the government and the White-owned business community.

### **The Use and Ethics of Boycotts to Overthrow the Apartheid State**

Various forms of boycotts were initiated by various individuals and institutions which aimed at bringing the South African apartheid state to its knees. The Anti-Apartheid Movement initiated in 1959 started as a consumer boycott in which Chief Albert Luthuli appealed to the international community to boycott South African goods. In 1989, a boycott bandwagon took the message all over the UK and spread to boycotts of South African gold and coal and tourism to the country. The boycott of all things South African spread to international sport where South African sportsmen and women were either banned from competing or made to feel very unwelcome by the international community. An academic boycott was also initiated which made it difficult for White South African academics to research and teach overseas. The boycott in general was eventually lifted in 1993 when the country was on the verge of electing its first democratic government.

Many of these boycotts were successful in isolating South Africa from the international community but actually had very little effect on the White population and created little inconvenience or hardship in their daily lives because substitutes

or alternative sources of goods for the South African market could be readily obtained from less scrupulous suppliers. And it was often possible to find alternative markets for South African products, particularly mining products for which South Africa was a primary source of world supply. However, the oil embargo – which, although not strictly a boycott, was nevertheless used as an instrument of economic pressure and punishment of the South African apartheid regime by the anti-apartheid international community in the early 1980s – did noticeably affect and inconvenience the White population by restricting travel and reducing the maximum speed limit to 80 km per hour throughout the country. However, again, this was transitory inconvenience and had little political or ethical influence on Nationalist voters’ attitudes.

From an ethical point of view, boycotts could be regarded as a double-edged sword. For example, reducing markets for South African goods abroad affected Black employment opportunities and caused unemployment among unskilled workers. Boycotts also initiated a determined drive by the Nationalist government to become as self-sufficient as possible in, for example, oil requirements, which was counterproductive to the Anti-Apartheid Movement’s fundamental “raison d’être.” This and other boycotts even engendered a kind of inverse “Dunkirk spirit” among the Nationalist government’s mainly Afrikaner supporters and the result of the boycott movement as a whole, may have paradoxically, enabled the apartheid government to endure a little longer than it erstwhile might have been able to do, since the movement kindled resolve among Nationalist voters to overcome many of the hardships intended by boycott punishments.

## Arctic Security

Gunhild Hoogensen Gjörv  
University of Akureyri, Akureyri, Iceland  
Centre for Peace Studies, UiT – The Arctic  
University of Norway, Tromsø, Norway

## Synonyms

Security in the High North

## Introduction

Perceptions of security in the Arctic are complex and multiple. Security is about freedom from worry or care, which can pertain to various actors including individuals, communities, nations, regions, as well as globally. Security “actors” seek to protect and ensure the survival into the future of that which they value most, using practices ranging from cooperative networks to military operations. As such, Arctic security ranges from state protection and military-based security perceptions to environmental security including consequences of climate change and human security concerns for different Arctic communities and populations. Arctic security concerns cannot and should not be understood as separate from broader global politics, trends, and claims to security.

## Description

Peace and security in the Arctic is often characterized by the concept of “Arctic exceptionalism,” describing the region as one that experiences “exceptional” peace and security (Käpylä and Mikkola 2015; Heininen 2019). The institutions and regimes that manage Arctic relations, including the UN Convention on the Laws of the Sea (UNCLOS) and the Arctic Council, are considered to be among the core measures that ensure that Arctic states do not come into (violent) conflict with each other. This situation is striking, not least as two Arctic states are the former superpowers of the Cold War era, the USA and Russia (former USSR), which continue to dominate the geopolitical landscape as heavily militarized, nuclear states. In addition, outside of the Arctic context, there is a polarized disagreement, if not conflict, between Russia and the other Arctic member states over Russia’s 2014 annexation of Crimea and involvement in the conflict in Ukraine. Thus far, there has not been any *overt* spill-over effect into Arctic issues and the Arctic region itself.

## What Is Security?

The Arctic makes an important case for understanding the linkages between security and ethics. *The* concept of security is about eliminating care or worry and reducing or eliminating fear. The security concept relies on the interplay between five elements: actors, values, practices, survival, and the future (Hoogensen Gjörv 2017). Historically, the concept of security has reflected *multiple actors*, ranging from the state to individuals, with values ranging from the material (physical wellbeing) to the immaterial (identity) (Rothschild 1995; Hoogensen 2005). The *value* of human *survival* played a central role. As well, security, as noted above, pertains to the *unknown (future)*, “[f]or security concerns precisely what we do not know” (Burgess 2011: 2). Further, “[t]he unknown, in its essence, by virtue of being unknown, is the foundation of ethics” (ibid.: 4). Security therefore is about making

decisions – engaging in *practice* – in the absence of security, where one must make a choice: it is “the disquieting task of making decisions under conditions of inadequate knowledge – decisions where it is the incalculable, the unforeseeable, the passionate, zealous or perhaps even apathetic, that counts” (ibid.: 5). Arctic security is subject to a myriad of such decisions within the unknown, from within questions of traditional geopolitics to pressing issues on environment, energy, and Arctic economies.

Traditional security studies came to dominate and define security studies as a field, where the value for human survival was transferred to an abstract concept called the state, limiting both the security referent (the subject of security) and the securitizing actor, to one actor – the state. In many respects this made sense, as the state has traditionally been conceptualized as relying on the deployment of the most extreme measures, usually the military, to address issues of immediate and existential danger. The concept of human security came into use through its introduction in the United Nations Development Programme’s (UNDP) 1994 Human Development Report (UNDP 1994). Human security made explicit the possibility of thinking about security beyond the confines of the state. By distinguishing *human security* from the dominant (*state*) *security*, the fears, needs, and priorities of ordinary people were brought to the forefront, highlighting that the security (and interests) of states did not necessarily coincide with the security (and interests) of people.

### Arctic Security Traditionally Understood

Arctic security pertains to a broad range of issues from state security to human security, and the decisions made within these different security contexts are continual exercises in ethics. It is a region where traditional geopolitics and security played out during the Cold War (Tamnes and Offerdal 2014). The Arctic region played a strategic geopolitical role “because of its position between the hostile superpowers and its potential wartime role as a corridor for a nuclear strategic

exchange” (ibid.: 13). The Arctic itself was never the center of disputes or conflicts; the causes lay south of the region. The interest between Arctic states to develop and maintain peaceful relations in the region was significant. The Arctic’s importance as a space full of resources made conflict resolution and “the delimitation of Arctic sea and land areas” paramount (ibid.: 18). The “warming” in relations between Arctic states that took place after the Cold War was the evidence of this commitment to low tension and cooperation. Already in 1991, the Arctic Environmental Protection Strategy (AEPS) was signed by representatives of the governments of Canada, Norway, Iceland, Finland, Sweden, Denmark, the USA, and the Union of Soviet Socialist Republics at the First Ministerial Conference on the Protection of the Arctic Environment (Roveniemi Declaration 1991). This was soon followed by the establishment of the Arctic Council in 1996 when “institutionalized, intergovernmental Arctic cooperation began” (Heininen 2019). Though relegated to a footnote, a central element of the Declaration on the Establishment of the Arctic Council is that it will “not deal with matters related to military security” (Ottawa Declaration 1996). This vow has largely gone uncontested, though military experts have been included on discussions of search and rescue issues (Bailes 2015). Thus far, this commitment has dominated deliberations about security in the Arctic, where military tensions do not enter into the discussion and where issues of the environment play a prominent role. This constellation of priorities has tried to ensure that future uncertainties and decisions about (environmental) security are embedded within an established spirit of cooperation.

The question is whether or not this sense of cooperation and commitment to solely non-military issues and low military tension will continue. Geopolitical uncertainty between Arctic member states has been on the rise, and established norms of cooperation could be under pressure. Questions continue to arise regarding possible digital attacks/cyberattacks designed to destabilize target countries and societies (Cox and Stranley 2017). Among the “Arctic Eight” – Canada, the USA, Norway, Denmark, Iceland,

Finland, Sweden, and the Russian Federation – five states are members of NATO. NATO-Russia relations have become increasingly tense since the Russia-Ukraine conflict.

## The Environment and Human Security

Simultaneously, these same Arctic states continue their committed and cooperative focus upon environmental issues. Here too, however, the Arctic states are confronted by a balance of uncertainties confronting our collective future. On the one hand is the priority of environmental protection, and not least the prevention of and mitigation against further climate change. At the same time, natural resources, including petroleum resources, play a pivotal role in Arctic economic and energy security (Hoogensen Gjørsv 2017). Despite the severe dip in oil prices since 2014, there continues to be an increase in proposed activities regarding energy and mineral resource development in the Arctic region. Therefore even with the downturn in prices for oil and gas that threatened a number of oil companies with potential and actual bankruptcy (Fortune/Reuters 01.04.2016), as the 2015 UN Framework Convention on Climate Change (UNFCCC) COP 21 Paris agreement, many analysts claim that oil and gas (particularly in the Arctic) will still have a role to play in global economies and politics, not least replacing dependencies on coal (Topdahl and Stokka 14.12.2015). The tensions between economic security, energy needs and energy security, and environmental security continue to be heightened within the context of increasing global attention to and scrutiny over extractive industries and their potential impact on global climate change, habitat degradation, community health and welfare, and apprehensions regarding offshore drilling that powerfully resurfaced in the aftermath of the 2010 Gulf of Mexico oil spill. Environmental impacts of continued oil and gas exploration in the Arctic thus have implications globally, but also locally, where climate change and environmental contamination of territories occupied by indigenous peoples impact food and health

security, as well as the ability of communities to continue traditional economic and social activities such as hunting marine mammals (whale, seal) and reindeer herding (Huntington et al. 2016; Stammer and Ivanova 2017). At the same time, however, the reduction or elimination of oil and gas development in the Arctic has a profound impact on the economic security of regions that have become reliant on these extractive industries as a promised or actual primary source of income and way out of poverty, including the Murmansk region in northwest Russia (Goes 2018). Human insecurities in the Arctic provide important case studies for understanding the contextualized, at times competing, and complex nature of human security.

## Summary

While a human security lens is most often applied to contexts of the global south, dynamics in the Arctic region also serve to illustrate the relevance of a multi-actor, state-to-human security perspective. Theoretically and conceptually, those who argued for a less limiting definition of security were able to more loudly argue for environmental security and human security, which engaged multiple actors and multiple contexts in which “survival,” “values,” “practices,” and “future” could be understood. Within developments in human security, the values that are relevant for survival are often understood within particular categories – economy, identity, food, health, energy, or the environment. Fear, and indeed fear for our future survival, has played an increasing role in climate change narratives but can also be found in justifications for continued oil and gas extraction. In the Arctic, the preeminence of environmental and economic security issues is increasingly confronted with tensions driven by traditional security and geopolitical concerns. With these more complex definitions of security, we expect more complex understandings of the ethical security dilemmas the Arctic faces.

## Aristotelian Business Ethics

Sven Horak

The Peter J. Tobin College of Business, St. John's University, New York, NY, USA

## Synonyms

Aristotle; Business ethics; Leadership; Virtues

## Introduction

Aristotle's view on ethics is rooted in the role of virtues in life and suggests that, once a person lives life with the goal of happiness in mind, that is, being a good person and living a virtuous life,

then that person will be inclined to make ethical decisions. Aristotle's focus on a person's virtues is distinct from other ethical theories, such as utilitarianism and deontology, that propose general rules or principles for moral actions (Sim 2010). Virtue ethics has its foundation in developing and acquiring virtues as the main goal of moral life. It can be traced back to Greek philosophy, particularly to Aristotle, who regards a virtue as a purposive disposition. "Disposition" indicates that a virtue is not a feeling that one has or an action that one has to take; rather, it is how we are inclined to be. As such, it stands to reason that, once we possess a certain virtue, we will always have a tendency to act in a certain way. If a person, for example, who usually does not make charitable contributions decides to make a donation in one particular instance, it does not mean that the person possesses the virtue of generosity (Willows 2013). This example makes the important point that, for people to be virtuous, their behavior must be a result of an unwavering disposition.

Virtues are understood as a way in which human beings are inclined that makes them good people and drives them to perform a function well, which further leads to the achievement of excellence. Aristotle believes that the virtue of something is whatever makes the object perform its function well, and the function is whatever makes the object what it is (Alison 2008). For example, the function of a car is the ability to move from one place to another. If a car is not able to perform its function of moving a person from one place to another, then we can correctly say that the car is not a "good" car. Human virtues follow this reasoning. They make humans carry out their distinctive function well, and the distinctive function that we have is the ability to reason (Alison 2008). This function allows us to understand universal ideas, decide between different options and control our desires (Bragues 2006). The ability to act according to reason is what sets us apart from everything else. Essentially for Aristotle, human virtues are those states of being that guide us to perform our function well, that is, to live rationally (Willows 2013). Aristotle would say that a virtuous person is one who carries out

a distinctive function well, which is living in accordance with reason, and this is a characteristic of being a good person and leads to excellence.

## Central Pillars of Aristotle's Virtue Ethics

Aristotle believes that what is good to do is also helpful in leading a good life (Willows 2013). While individuals often think of money and security among many other goals to achieve to lead a happy life, this is not what Aristotle had in mind. The epitome of a good life, and the supreme goal that actions are geared toward and can achieve, is the attainment of "eudaimonia" (Belak and Rozman 2012). The Greek word "eudaimonia" or happiness does not refer to self-gratifying pleasure, which can vary from person to person. Happiness is seen as a kind of reasonable participation: "to be happy takes a complete lifetime; for one swallow does not make spring, nor does one fine day; and similarly, one day or a brief period of happiness does not make a man supremely blessed and happy" (Nicomachean Ethics 1934: 1098a). This means that, to achieve the ultimate goal of happiness, one must live a virtuous life. However, virtues are not the only requisite for eudaimonia as resources are needed to perform good actions. Hence, to possess a virtue is to act in a rational way that is characteristic of human beings, and virtuousness is in essence a state of being that guides us to achieve happiness.

Aristotle makes a distinction between two kinds of virtues: intellectual virtues and moral virtues. Intellectual virtues relate to the mind, like having specific knowledge of subject matters and having special skills, while moral or character virtues are virtues such as justice and courage (Willows 2013). We learn intellectual virtues through education or instruction, more in the sense of an institution setting, and we learn moral virtues from an early age through socialization and acquire them through habit (Jensen 2009).

One virtue that Aristotle focuses on is actually an intellectual virtue but is necessary for the proper working of the moral virtues. This virtue

is what he refers to as “*phronesis*” or good judgment. A prudent person is considered to be someone who is able to think something through thoroughly and balance what is good and beneficial. Further, a prudent person is one who has virtues and will be able to act accordingly in each situation as a result of practical wisdom. Therefore, prudence shows a virtuous person how to act appropriately. It can be said that one cannot be a truly virtuous person without moral virtues and practical reason. To act rationally, virtues are needed, and practical wisdom allows us to act appropriately, so virtues and practical wisdom are mutually dependent on each other, meaning that one cannot exist without the other (Belak and Rozman 2012).

According to Aristotle’s theories, all human actions ought to be aimed at achieving happiness. To reach that ultimate goal, we must possess virtues and act in a rational manner, which is our distinctive characteristic that allows us to be good human beings. For Aristotle, ethical dilemmas exist within a particular context and involve particular people who have particular motives, so he would say that there is no single rule or even a few standard rules to follow. He would agree that we would need to know all the details of a particular ethical issue and then act rationally to resolve it in an ethical way (Duska 2014). Aristotle would view a corporate code of conduct implemented to guide employees’ ethical behavior as not being enough to ensure ethical decision making. He would argue that people would have to consider rationally all the things that are unique to the specific situation and act prudently in accordance with their virtues, which will ultimately lead them to make an ethical decision.

## Virtue Ethics in Today’s Business Environment

While a modern business environment differs from the environment in ancient times, Aristotle’s ideas can still be regarded as relevant today and as a valuable source of inspiration across several dimensions. To utilize them, they need to be reinterpreted and put into the current context. In

doing so, Solomon (1992) suggests several dimensions that can be interpreted in the context of Aristotle’s ideas. One of those is *community*, which refers to the corporation as being first and foremost a community. We tend to associate who we are with the community that we belong to and find our identities at our place of employment. Aristotle would in fact agree with this as he believes that we all belong to a community and our individual interests are in line with the overall interests of that community. This idea of the corporation being a community is such an important point because today more and more employees do not view their place of employment in this way. They see their workplace as somewhere to spend a number of hours every day to complete specific tasks and receive a salary at the end of a time period. With this view, there is no sense of being a part of a community aimed at promoting the greater good for society. This outlook is problematic because employees are only motivated by self-interest, potentially leading to unethical behavior. Following Aristotle, it can be claimed that a virtuous person in a “good” community is someone who will make ethical decisions. This statement makes sense in that, if employees recognize their corporations as good communities and they exercise their virtues, then it is more than likely that they will be inclined to make ethical decisions.

A further dimension is *excellence*. Virtues are not just about avoiding wrong actions and complying; rather, they involve always doing one’s best and flourishing. People should not only engage in actions that allow them to perform well and thrive in their own personal life. They should do so in a business environment as well, which will promote ethical behavior. There should be no border distinguishing personal virtues from workplace virtues. People’s virtues should guide their behavior in every circumstance in their life.

*Role identity* is another dimension to consider. Solomon (1992) makes the point that the role that one assumes in a corporation is what gives ethical issues their relevance. Each person within an organization has certain roles and responsibilities that come with the job, and several expectations must be met. As a result of different roles, with

different responsibilities and expectations, very general ethical rules will not be useful in solving ethical dilemmas within an organization since each situation will be unlike another, which is in line with what Aristotle's ethics tell us. This is a problem in the modern business world as corporations try to apply the same general ethical standards to everyone within the organization. In addition, many employees find that one role that they have may clash with another role that they have to assume, and workplace roles may clash with personal roles, so it is difficult to act ethically in every situation. This is a significant issue that corporations must address.

*Integrity* is also a key dimension in the modern business environment and a key virtue in Aristotelian ethics as it concerns a person's roles and duties in a job and the virtues that have to be in play as a result. It is common in the workplace for employees to compromise their integrity by deviating from what is required of them by their job; in so doing, they end up making unethical decisions. There are some instances in which employees have to show integrity by acting against their roles and duties. For instance, if a manager asks an employee to perform a task that the employee knows is not right, then that employee should allow the virtue of courage to shine through and let the manager know in a respectful manner that he or she is only willing to perform duties that are honest and ethical (Duska 2013). If a person employs other values and acts on what is right or good, then we can say that the person has integrity.

Aristotle places great emphasis on "phronesis," that is, practical wisdom or *judgment*. Employees face a number of ethical issues daily, and, following Aristotle, each situation is unique and it is not possible to follow a general rule. Hence, judgment is integral to ethical decision making in a corporation. It is not simply judgment but "good" judgment that is required, and good judgment is tricky. As Provis (2010) states, it is about initially recognizing that there is a decision to be made, and it then involves great deliberation about certain outcomes that results in the best possible decision given the situation. Good judgment is not simply making the decision with the fewest consequences for the corporation,

the one that will save the corporation the most money or the one that is the fastest to make, which happen to be factors that people with the authority to make decisions end up considering. These insufficient and unreasonable thought processes show a lack of good judgment by people within corporations, which easily leads to unethical behavior.

## Conclusion

Aristotle's view of business ethics is rooted in the role of virtues and suggests that, once a person lives life with the ultimate goal of happiness in mind, that is, being a good person and living a virtuous life, then that person will be inclined to make ethical decisions.

Aristotle's virtue ethics appear to be timeless and can be reinterpreted in today's business environment and utilized to promote ethical decision making not only in corporations but in everyday life. A central societal challenge that corporations should address is the growing lack of community spirit and eroding solidarity. Individuals are self-interested and focus on the potential for profits to the detriment of their morals and virtues. While it is easy to motivate employees with monetary benefits, it may lead in the long run to a culture in which no other incentives than cash will have any effect. Corporations can take action and change this situation by, for instance, taking an introspective look at their corporate culture and supporting to a lesser degree a climate that attaches performance solely to monetary incentives but rather promoting a culture of compassion and community. This is likely to help employees to achieve happiness through their connection to others and support ethical behavior.

## Aristotle

Brennan McDavid  
Philosophy Department and Smith Institute for  
Political Economy and Philosophy, Chapman  
University, Orange, CA, USA

## Introduction

Aristotle (384–322 BCE) was a Greek philosopher who figured prominently in the Classical period of Ancient Athens. He was born in Stagira, a small town near modern day Thessaloniki, as a subject of the Macedonian kingdom. At the age of 17 years old, he moved to Athens in order to study

at Plato's already famous Academy. Under Plato's supervision, he developed the beginnings of a systematic philosophy encompassing claims in subdisciplines ranging from ethics and psychology to natural science and metaphysics, and he came to disagree adamantly with many of the central commitments of his teacher. After leaving the Academy, Aristotle went on to effectively invent many domains of inquiry, notably biology, zoology, logic, and philosophy of science. He took on famous students, including Theophrastus who would succeed him as head of the Peripatetic School at the Lyceum and a young prince of Macedon named Alexander who would emerge onto the world stage as Alexander the Great only a few years after the close of his time with Aristotle. Upon his death in 322 BCE, Aristotle was only 62 years old, but had already accomplished enough to shape the course of history.

## Written Works and Legacy

Unlike some of his philosophical predecessors such as Socrates who preserved none of their ideas in writing, Aristotle was a prolific writer, and even by today's standards. Though by some accounts only one-fifth of his writings have survived, the body of Aristotle's extant work is vast, comprising treatises in logic, epistemology, metaphysics, philosophy of mind, psychology, metaphysics, physics, biology, astronomy, meteorology, ethics, political theory, and more (Barnes 2000, p. 4). The entirety of his "exoteric" work – the treatises that were produced in a style intended for readers outside of his school – is considered lost and is known to exist only through praise heaped upon it by near contemporaries such as Cicero who is often quoted saying that Aristotle's writing was like "a flowing river of gold." Unfortunately, the extant works do not live up to this praise, reading instead like working drafts and lecture notes to be utilized within circles already familiar with Aristotle's system of thought (Barnes 2000, p. 5).

The era following Aristotle's death saw further development of his school and circulation of his

ideas, including through his exoteric works. But it was Plato's ideas and Neoplatonism that took center stage in the West at that time. Around 600 CE, Aristotle's work was effectively forgotten in the West, though continued to enjoy priority further East in Byzantium and the Arabic speaking world. It was not until the twelfth century CE that Aristotle was rediscovered in the West and, due to being championed by prominent theological scholars such as Thomas Aquinas, became entwined with Christian thought and the Thomist project of synthesizing theology and pagan philosophy. Aquinas' *Summa Theologica* is definitive of this project.

The centrality of Aristotelianism to Aquinas' theology together with Aquinas' power and influence over scholasticism and the wider scholarly community resulted in Aristotle's ideas dominating the intellectual world from the thirteenth century through the Renaissance. His theories of hylomorphic substances, the four causes, potentiality and actuality, categories and essences, the mechanics of motion, and the logic of syllogisms, were all cornerstones of the dominant scientific worldview. When Kepler, Galileo, *et al.*, advanced the scientific revolution of the Renaissance, it was explicitly Aristotle's ideas that they challenged. Two centuries later Charles Darwin's theory of the process of natural selection would unseat Aristotelian teleological explanations in the domains of biology and life sciences as well.

Aristotle's contributions outside of science have enjoyed a longer legacy. Particularly, various aspects of his ethical theory have persisted in importance, even seeing a wholesale revival in the form of modern "virtue ethics" in the twentieth century. His conceptions of (i) happiness (what he calls *eudaimonia*) as the ultimate good and purpose for human beings and (ii) performance of the human function as the means for achieving happiness are among his unique contributions. Budding from these foundational elements of his ethical theory, Aristotelian arguments and proposals for ethics in the business sphere have recently been gaining momentum.

## Eudaimonism and Purpose

The importance of happiness in human life is almost universally acknowledged. Aristotle himself notes this universality in his *Nicomachean Ethics* (*NE*), where he introduces his conception of happiness as the highest good for human beings. His argument depends on the premise that all human beings choose their actions with purpose, and that purpose is something that appears good to the agent, whether or not it is an actual good (*NE* 1.1). Because this analysis leaves open the possibility that our purposes could be nested in such a way that we are always seeking to fulfill a given purpose for the sake of fulfilling a yet further purpose, and so on *ad infinitum*, Aristotle posits a *summum bonum* ("highest good") that is complete and pursued for its own sake and is our final purpose for action (*NE* 1.2 1094a17-21). It is this *summum bonum* that he calls happiness.

Aristotle's substantive conception of happiness goes beyond this account of its position as our final end. He disputes folk conceptions that figure the maximization of pleasure or honor as constituting happiness, and he argues that happiness is better understood as a way of life (*NE* 1.7 1098a2). Specifically, it is a distinctively human way of life that is achievable through excelling in distinctively human activities such as learning, exercising knowledge, and navigating one's social world.

The Aristotelian conception of purpose has become a guiding principle in business and professional ethics through the advent of practices such as mission statements and norms governing corporate social responsibility (CSR) and fiduciary duty. The design and articulation of a purpose, often one that transcends the goal of profit-earning, builds on Aristotle's conception of flourishing consisting in the fulfillment of an end that is valuable for its own sake. A well-articulated purpose can advance public perception of an organization and also motivate employees who often tether their own identity and success to that of the organization (Hartman 2013, p. 129).

## The Function Argument and the Virtues

In arguing that the human good, that is, happiness, is a distinctively human way of life, Aristotle relies on the notion that “the good – the doing well – seems to lie in the function” for anything that has a function. This claim amounts to the idea that the flourishing and fulfillment of purpose for any sort of thing that has a characteristic activity or unique output is in the performance of that activity or production of that output. Thus, the good for a carpenter is in the production of tables and cabinets; the good for an eye is in seeing; the good for a boat is in conveying persons or goods across water. Aristotle’s next step is to establish both that human beings possess a function in their essential nature and what that function might be.

He argues that the function of human beings must be something distinctive, not shared with other organisms.

What, then, could this be? For living is evidently shared with plants as well, but we are looking for what is special. Hence, we must set aside the living that consists in nutrition and growth. Next in order is some sort of perceptual living. But this too is evidently shared with horse and ox and every animal. There remains, then, some sort of practical living of the part that has reason. (*NE* 1.7 1097b31-1098a2)

Rational activity is the human function, then, and it is in the performance of rational activity that we achieve our good. Aristotle does clarify that this function must be performed *well* if it is to deliver us to our end and that performing a function *well* requires performing it in accord with the excellences or virtues that are proper to the activity. In the case of the carpenter, the relevant excellences or virtues will be the skills necessary for producing high quality tables and cabinets; in the case of the boat, they will be the material features that enable boats to move quickly across water while remaining afloat. For human beings, the relevant virtues will turn out to be what we ordinarily think of as virtue, that is, ethical virtues of character as well as intellectual virtues that include practical wisdom. “If all this is so, the human good turns out to be activity of the soul in accord with virtue and, if there are more virtues

than one, then in accord with the best and most complete” (*NE* 1.7 1098a15-17).

Alasdair MacIntyre, a prominent philosopher in the modern virtue ethics tradition, has utilized Aristotle’s conception of the integral relationship between ethical virtue and flourishing to argue for the conclusion that “the tradition of the virtues is at variance with central features of the modern economic order” (1984, p. 254). His argument charges that modern business activity lacks what he calls an “internal good,” the pursuit of which might enable business participants to cultivate their own excellence as they practice their business activity. Effectively, on this view, business participants are made to act in ways far divorced from the excellent performance of our human function and, therefore, far divorced from our happiness.

Further implications for business ethics have been derived from Aristotle’s theory of habituation, a process by which character virtues are cultivated, as well as his “doctrine of the mean,” according to which “[character] virtue is concerned with feelings and actions in which excess is in error and subject to blame, as is deficiency, whereas the mean is subject to praise and is on the correct path” (*NE* 2.6 1106b24-25).

## Arms Industry

Edmund F. Byrne

Emeritus Professor, Indiana University-Purdue  
University at Indianapolis, Indianapolis, IN, USA

## Synonyms

Arms trade; Defense industry

## Definition/Introduction

The arms industry is a global business whose participants manufacture, sell, and service weapons, military technology, and complementary equipment. It is heavily involved in research and development, engineering, producing and servicing military material, equipment, and facilities. Arms-producing companies, also called defense contractors or collectively the defense industry, produce arms primarily for the armed forces of states. Distribution of arms is, however, a vast enterprise in its own right, in part arranged by agencies of governments and to a lesser extent by private merchants. To the extent that controls are maintained over distribution, this control is qualitative rather than quantitative. In other words, the total amount of product provided is open ended, whereas recipients, mostly forces defending or opposing developing countries, are selectively precluded from obtaining the most sophisticated equipment.

Data regarding global arms sales have for years been gathered and made available to the public by the Stockholm International Peace Research Institute (SIPRI). According to SIPRI, world military expenditure is estimated to have been \$1676 billion in 2015, this total accounting for 2.3% of global gross domestic product or \$228 per person (SIPRI 2016, p. 17). This global amount is, however, by no means evenly divided among recipients or distributors. The combined arms sales of the top 100 largest arms-producing companies amounted to over \$400 billion in 2013 according to SIPRI (2015, 10, p. 3). Still more revealing of

the locus of global military power, the ten largest arms-producing companies, all in the USA or Western Europe, generate 80.3% of the revenue that went to those top 100 companies in 2014 (SIPRI 2016, p. 19).

The mainstream arms industry provides guns, ammunition, missiles, military aircraft, vehicles, and ships, electronic systems and their complements, and increasingly the means to engage in cyber-warfare. Smaller purveyors focus for the most part on land-based small arms. For all these products, logistical and operational support is available. Producing companies typically vie for contracts with a national government, but open bidding does not always take place. The full range of products utilizable by military personnel is potentially as extensive as the totality of human needs, at least to some degree. But arms industry products more narrowly conceived have involved three categories of weapons: land-based weapons, including small arms; naval systems; and aerospace systems. An emerging category: cybersecurity.

## Principal Producers and Buyers Over Time

Humans have been making weapons since prehistoric times, and over centuries if one group developed a temporary advantage over another, the other would strive to surmount it. With the emergence of the industrial revolution, countries able to apply their technological base to engines of war had significant advantages. For example, guns capable of firing more than one round without reloading had been built by 1500 AD, but fully automatic machine guns were not perfected until the mid to late nineteenth century with the help of precision manufacturing machines (see Wikipedia, "Machine gun"). Primitive submarines appeared during the US Civil War (1860–1866); tanks and weaponized planes during WW I; and land mines, nuclear bombs, and much else during WW II and since then countless creations ranging from guided missiles to jet airplanes to unmanned drones. A group with access to any of these that remained unavailable to a foe would have a

technical advantage, and this basic datum drives the arms sales industry as we know it today.

The quest for technical advantages plays a key role in modern warfare, as illustrated by foes vying to make the first atom bombs during WWII, even as they competed routinely for access to oil for their vehicles. Possession of nuclear bombs was a key to military status during (and since) the Cold War, but so too was access to jet airplanes more sophisticated than enemy forces possessed. The demand thus generated was met, subject to self-serving constraints, by willing suppliers.

Throughout the Cold War, the principal opponents, the USSR and the USA, were first and second (40% and 28%, respectively, in 1989) in the global trade in conventional weapons to whichever less advanced countries either of them trusted. In 1995, 6 years after the fall of the Soviet Union, Russia controlled only 17% of this trade, whereas the US had come to control 42% (Anthony 1997, pp. 17, 23). This emergent dominance of the USA solidified with mergers and acquisitions at home and co-production arrangements with buyers abroad (Kapstein 1997). It retained superiority by banning sales of its most advanced weapons to all but its most trusted allies (Nolan 1997).

## Land-Based Weapons

Land-based weapons include everything from light arms and land mines to tanks and heavy artillery. The majority of producers are small. Many are located in developing countries. They produce and sell handguns, machine guns, tanks, armored personnel carriers, and other lower-cost weapons and platforms for weapons (Brauer 2002).

The Control Arms Campaign and the International Action Network on Small Arms estimated early in the twenty-first century that there are well over 600 million small arms in circulation, and that these are produced by over a thousand companies in nearly 100 different countries (Hillier and Wood 2003). Sales of such equipment is poorly regulated internationally, so many of these weapons wind up in the hands of organized

criminals, rebel forces, terrorists, or regimes under sanctions (Stohl and Grillot 2013).

## Naval Systems

Major powers have long felt a need to maintain a naval force comparable to that of their adversaries. This strategy has led to the construction of numerous aircraft carriers, submarines, and advanced anti-air defense systems. Some of these are nuclear powered and as such are not available to developing countries. Updating older vessels is a stable industry.

By any standard, the US Navy is the largest in the world, with a fleet weighing 3,415,897 tons – four times greater than second-place Russia's. Others in descending order: China, Japan, UK, France, India, South Korea, Italy, and Taiwan (Myzokami 2014). Mere tonnage, of course, does not equate to military prowess. But fire-power capabilities are being substantially enhanced on older vessels. Overall, at the end of 2016 the US Navy had 440 ships in active service or its reserve fleet, with another 70 planned or under construction. These include 234 commissioned, 104 noncommissioned, 50 support ships, and 51 in its ready reserve force (Wikipedia nd). It has the world's largest aircraft carrier fleet, with ten in service, two in the reserve fleet (Hillier and Wood 2003), and three new carriers under construction (NATO Review 2014).

## Aerospace Systems

Until recently, aerospace has been the most technologically advanced sector of the arms industry. It comprises military aircraft (both naval and land based) and its producers are minimally competitive in economic terms. The top clients and producers are mostly in the western world, principally the USA and Russia. Having endured multiple mergers, the top firms now are BAE (UK company, first outside USA in number one position), Boeing, Dassault Aviation, EADS, Finmeccanica, Lockheed Martin, Mikoyan, Northrop Grumman, Rolls-Royce, Sukhoi, and Thales Group. Several

multinational consortia have coordinated production of fighter jets such as the Eurofighter Typhoon, 599 of which are now in operation.

The military planes most in demand are prohibitively expensive: four of the top ten cost over \$100 million each, three are over \$200 million, and two are over \$300 million. Each of the 20 extant F-2 Spirits, in use since 1993, cost \$2.4 billion each. And the current

program to build F35 jets is expected to cost \$400 billion. As for purchasers of planes now being built, the market is expected to grow from \$61.2 billion in 2016 to \$88.9 billion in 2026 (PRNewswire 2016). North America will have 33% of this market, Asia-Pacific and Europe 25% each, and the Middle East, Latin America, and Africa 17% each. Types of planes to be bought are multipurpose 56.8%, reconnaissance 24%, and surveillance 8.8%.

## The Cybersecurity Industry

The cybersecurity industry, though still immature, is already important to the defense industry. The 2013 NATO review deemed cyber attacks as one of the greatest risks to defense in the next decade. A mere 3 years later apparent Russian intrusion into the 2016 US presidential election generated calls around the world to heighten the security of governmental processes. It had become apparent that higher levels of investment in the cybersecurity industry are needed to produce new software able to protect the ever growing transition to digitally run hardware. The military in particular needs better protections of the systems it uses for reconnaissance, surveillance, and intelligence gathering. This means, according to Sharma (2017, p. 1), “Huge investments in cloud network security solutions applicable for the battlefield management, data protection, & wireless security solutions along with development of network security & cloud security software stands out as the key factors contributing to the growth of the cyber security market for the defence sector.”

To protect the cyber world from attacks, there are advanced cyber protection strategies used such as content, cloud, and wireless security.

These can be intertwined to form several secure layers. In response, cyber attacks and cyber attackers have become more advanced in their field using techniques such as Dynamic Trojan Horse Network (DTHN), Internet Worm, Zero-Day Attack, and Stealth Bot. As a result, the cybersecurity industry has had to improve the defense technologies to remove any vulnerability to cyber attacks using systems such as the Security of Information (SIM), Next-Generation Firewalls (NGFWs), and DDoS techniques (Sharma 2017, p. 1).

As the threat to computers grows, the demand for cyber protection will rise, resulting in the growth of the cybersecurity industry. It is expected that the industry will be dominated by the defense and homeland security agencies which already account for 40% of the industry. In other words, governments have begun to invest and allocate funds to the cyber industry. For cybersecurity in 2016, the US government allocated \$14 billion and the UK government allocated £860 million (NATO Review 2013). A 2017 projection envisions a cybersecurity market at \$1 trillion by 2021 (Market Research Media 2017).

As these investments increase, the demand that organizations improve their cybersecurity systems for these markets increases as well. The major organizations involved in cyber defense are Intel, BAE Systems, Lockheed Martin, Northrop Grumman, Raytheon, The Boeing Company, General Dynamics, and Shoghi Communications (Market Watch 2015).

## Largest Defense-Industry Companies

Amaranda Bhushan Dhiraj (2016) has identified the top 25 defense companies in the world in 2015. His list includes each company's defense industry income and that income's percentage of the company's total intake for the year. Fourteen of these companies are in the USA, five in Western Europe, three in the UK, and three in Russia.

Dhiraj's data (DR=defense related; DK=defense contracts):

1. Lockheed Martin (US): \$40.13 billion DR; 88.00% of total revenue from DK

2. Boeing (US): \$29 billion DR; 32% from DK
3. BAE Systems (UK): \$25.45 DR; 92.80% from DK
4. Raytheon (US): \$22.23 billion DR; 97.40% from DK
5. General Dynamics (US): \$18.56 billion DR; 76.70% from DK
6. Northrop Grumman Corp. (US): \$18.40 billion DR; 76.70% from DK
7. Airbus Group (Netherlands): \$14.61 billion DR; 18.10% from DK
8. United Technologies (US): \$13 billion DR; 20% from DK
9. Finmeccanica (Italy): \$10.56 billion DR; 54.20% from DK
10. L-3 Communications (US): \$9.81 billion DR; 80.90% from DK
11. Almaz-Antey (Russia): \$9.21 billion DR; 100% from DK
12. Thales (France): \$8.46 billion DR; 49.10% from DK
13. Huntington Ingalls Industries (US): \$6.82 billion DR; 98% from DK
14. United Aircraft Corp. (Russia): \$5.43 billion DR; 22.60% from DK
15. Rolls-Royce (UK): \$5.43 billion DR; 22.60% from DK
16. Honeywell (US): \$4.75 billion DR; 11.80% from DK
17. Textron (US): \$4.72 billion DR; 34.00% from DK
18. AECOM (US): \$4.43 billion DR; 22.60% from DK
19. Booz Allen Hamilton (US): \$4.1 billion DR; 20% from DK
20. Safran (France): \$4.08 billion DR; 20% from DK
21. DCNS (France): \$4.07 billion DR; 100% from DK
22. GE (US): \$4 billion DR; 16.70% from DK
23. Russian Helicopters (Russia): \$3.96 billion DR; 80% from DK
24. Leidos (US): \$3.63 billion DR; 71.60% from DK
25. Babcock International (UK): \$3.56 billion DR; 48% from DK

**World's Largest Arms Exporters** In 2010–2014 the five biggest exporters were the USA, Russia, China (having passed Germany), Germany, and France. Each country's prioritization is historically traceable, e.g., that of the USA to President Nixon's 1969 upgrading of arms sales to diplomatic status (the Nixon Doctrine).

**World's Largest Arms Importers** For some time up to 2017, the eight biggest importers of arms were India (14%), Saudi Arabia (7%), China (4.7%), the United Arab Emirates (4.6%), Australia (3.6%), Turkey (3.4%), Pakistan (3.3%), and Vietnam (2.9%) (World Atlas 2017). Territorially, countries in the Middle East and/or on the Persian Gulf are most voluble and hence the largest purchasers. Arab countries in this region depend on quantity, comparatively small, and Israel on quality of the weapons procured (Aly 1997). South Asian countries India and Pakistan have historically been exceptionally hostile toward one another. Both are nuclear armed, proliferation prone, and (in the case of India) an independent weapons producer (Jones 1997).

**International Arms Control Treaties** Even as the institutions here named do their utmost to enlarge the market for weapons, other entities seek to contain such proliferation. By virtue of their efforts, our planet has been rendered somewhat safer by the adoption of treaties. Those with most bearing on arms trade are the following:

- Geneva Protocol on chemical and biological weapons, 1925
- Partial Test Ban Treaty, signed and in force 1963
- Outer Space Treaty, signed and in force 1967
- Nuclear Non-proliferation Treaty, signed 1968, in force 1970
- Seabed Arms Control Treaty, signed 1971, in force 1972
- Strategic Arms Limitation Treaty (SALT I), signed and ratified 1972, in force 1972–1977
- Biological Weapons Convention, signed 1972, in force 1975
- Convention on Certain Conventional Weapons, signed 1980, in force 1983

Threshold Test Ban Treaty, signed 1974, in force 1990  
 Treaty on Conventional Armed Forces in Europe (CFE Treaty), signed 1990, in force 1992  
 Chemical Weapons Convention, signed 1993, in force 1997  
 Ottawa Treaty on antipersonnel land mines, signed 1997, in force 1999  
 Convention on Cluster Munitions, signed 2008, in force 2010  
 Arms Trade Treaty, concluded in 2013, in force 24 December 2014

Some of these agreements have had more beneficent effects than others, depending largely on how well they have been adhered to. In this regard a hopeful step forward was the 1996 Wassenaar Arrangement on Export Controls for Conventional Arms and Dual-Use Goods and Technologies, which requires post-transaction notification of relevant sales (Pierre 1997, pp. 391–401). A potentially stronger agreement is the 2014 Arms Trade Treaty, which now has 130 signatories, 88 ratifications (<https://www.un.org/disarmament/convarms/att/>). Five of the top ten arms producers have signed; nonsigners include Russia, China, and the USA.

The latter's noncompliance illustrates regulatory priorities too well: when then US President Obama sent the 2014 treaty to the US Senate for approval, the Senate – informed and funded by the National Rifle Association – voted against signing lest it violates the gun rights granted by the Second Amendment of the US Constitution (Cox 2013). To generalize from this example, the global arms industry is far less regulated than it has to be if the world's troubled countries are ever to be constrained in their reliance on killing to effect their ends. These troubled countries, in turn, are often just pawns whose corrupt government officials are facilely manipulated by bribes they receive from the agents of arms manufacturers that routinely hawk their most expensive hardware, duly marked up, rather than what the buying country might possibly need (Feinstein 2012).

## Artificial Intelligence and Business Ethics

John-Stewart Gordon  
 Department of Philosophy, Vytautas Magnus  
 University, Kaunas, Lithuania  
 Faculty of Law, Kaunas, Lithuania

### Synonyms

AI and business ethics

### Introduction

In recent years, the technological developments concerning artificial intelligence (AI), robotics, computer science, and the Internet of Things (IoT) and the ongoing fusion of the physical, digital, and biological worlds (the Fourth

Industrial Revolution), all in the context of the so-called metaverse, have had – and continue to have – a widespread and profound impact on all areas of human society (Gordon and Nyholm 2021; Müller 2020). This entry will examine some of the main issues related to the effect of AI on business ethics with a particular focus on its negative impacts.<sup>1</sup>

### Preliminary Remarks

AI is the main driving force and the very foundation of increasing possibilities in technology-related areas of human societies. But what is AI? One scholarly definition is offered by Copeland (2020), who describes it as follows:

the ability of a digital computer or computer-controlled robot to perform tasks commonly associated with intelligent beings. The term is frequently applied to the project of developing systems endowed with the intellectual processes characteristic of humans, such as the ability to reason, discover meaning, generalize, or learn from past experience.

It is a matter of ongoing academic discussion (Bostrom 2014; Ord 2020) whether current AI systems will become so advanced by some future point as to either equal human intelligence or even outpace us and hence become superintelligent. This is called the technological singularity (Kurzweil 2005). This trajectory’s ethical, legal, and socio-political implications have been recently examined in a special issue edited by Gordon (2021). Do intelligent machines have moral and legal status, and are they hence entitled to moral and legal rights (Gordon and Gunkel 2021; Gordon 2020c; Gunkel 2018)? And if so, what about conflicting rights claims of intelligent machines and the humans who wish to use them for commercial purposes? Whose claims should prevail in cases of conflict (Chomanski 2021)?

---

<sup>1</sup> A recent special issue in the *Journal of Business Ethics* on “Business Ethics and the Era of Artificial Intelligence” (Haenlein et al. 2022) substantiates the significance of research at this intersection. It offers an in-depth analysis of many issues concerning AI and business ethics.

These and related issues are of utmost significance in the long run.

Business ethics is a prominent subdiscipline in applied ethics that concerns any ethical issues that might arise in the business environment. It also encompasses individual and corporate conduct and ethical norms, moral values, principles, policies, and regulations applied in business. Business ethics has become more prominent against the background of emerging technologies, particularly in the era of AI. Many of the current problems are concerned with issues caused by the application of AI in businesses, as discussed below.

## AI's Impact on Business Ethics

The technological advances of AI have had an increasing impact on business ethics due to the possibilities that new technologies provide for businesses. In recent years, AI has offered many advantages and positive developments to companies. In this section, however, the focus is primarily on the negative implications of AI in the business world (Haenlein et al. 2022). The following topics will be briefly examined: corporations, the banking and insurance sector, marketing and advertising, blockchain and cryptocurrency, and work and existential boredom. Moral dimensions of these issues will be further discussed in the following section.

### Corporations

The application of AI in businesses is unavoidable, particularly in areas that involve monotonous tasks such as screening numerous job applications. Unfortunately, the application review practices of AI systems mirror (and even worsen) human bias in the selection process (Hunkenschroer and Luetge 2022). This problem, called machine bias, results either when the algorithm is defective or when a decision is based on inadequate historical data. In addition, teams that develop the software for applications such as employee hiring tend not to be diverse but commonly consist of white males, who are often

untrained concerning hidden human bias toward different ethnicities and women. Therefore, AI does not put an end to discrimination based on ethnicity, sex, skin color, religion, and other factors but, rather, often replicates previous injustice and inequality (Gordon and Nyholm 2021, section 2c).

Furthermore, according to Haenlein et al. (2022), reported cases reveal that employers can use AI to assist employee surveillance, which can undermine healthy company–employee relationships if employees discover that they are being spied on (e.g., the software Status Today). Another risk is that businesses may use AI-supported cyberattacks to investigate their rivals' new developments and strategies so as to gain an advantage in a highly competitive business environment.

### The Banking and Insurance Sector

Nowadays, credit decisions are made mostly by AI and only rarely by appointment with a clerk at a bank, as was common in previous years. The AI system screens the historical data, the postal codes (relevant because of socioeconomic differences between neighborhoods), names (which may reveal one's non-Caucasian heritage), education, employment history, current income, previous experience of losing jobs, whether the applicant is insured (if not, this might indicate a general lack of money), and other potentially discriminatory factors. Machine bias also affects loan decisions. People with a particular background may not get a loan or may be offered less attractive terms, often on dubious grounds (such as improperly prepared historical data).

Likewise, the insurance sector uses similar tools to determine whether certain people are more at risk than others and to deny them policies or offer less favorable terms. Reported cases show, for example, that African Americans in the USA have been systematically disadvantaged in the banking and insurance sector based on AI software (Ludwig 2015). This substantiates the continuing problem of injustice and denies many people in need of the opportunity to escape from precarious socioeconomic conditions.

## Marketing and Advertising

The widespread collection of customer information for marketing practices such as personalized advertising (including nudging) and dynamic pricing to promote impulse buying is well-known in the business industry (Haenlein et al. 2022). The data collection takes place through AI software, which determines all relevant (and even irrelevant) online and offline behavior of customers with regard to buying goods, interests, and hobbies.

This AI-supported data collection, which often happens in a legal grey zone, has already caused numerous scandals. Cambridge Analytica (CA) specialized in data analysis from 2014 to 2018, particularly with respect to influencing voters in numerous US campaigns through micro-targeting. CA acquired 50 million datasets from Facebook in 2014 (unknown to the users). The data were then used, among other ways, in the 2016 US presidential election to influence votes in swing states. CA has become a byword for the misuse of data.

Everything that supports bigger sales is of utmost significance to companies. This includes online surveillance on social media platforms such as Facebook, Twitter, and Instagram, as well as reservation tools such as [Booking.com](https://www.booking.com). The targeting and nudging of customers to arouse specific needs that previously were latent or did not exist at all are somewhat alarming. Information is the new gold.

## Blockchain and Cryptocurrency

The blockchain revolution can have positive and negative impacts. Concerning the latter, it can have a profound impact on criminal prosecution if used for illegal activities. Blockchain technology allows peer-to-peer transactions without using the bank as a mediator; the participants remain anonymous, and all transactions are transparent and accountable. The blockchain is also used as a decentralized database for digital currencies, i.e., cryptocurrency, making it very difficult or impossible to track transactions between individuals. There is no regulating authority because decentralized systems are used to record all transactions. The system runs on AI and can

provide the technological framework for illegal transactions. That does not mean that all transactions are unlawful, but criminal actors have gravitated to blockchain and cryptocurrency technologies to hide their illegal actions.

Of course, blockchain technology is used not only in the banking sector but also in many other areas of human activity. An excellent overview of the different fields of application and their pros and cons (including moral issues discussed) against the background of AI is provided by Sharif and Ghodoosi (2022).

## Work and Existential Boredom

The automation and job displacement caused by the industrial revolution in the nineteenth century had profound consequences for the labor market. The current technological developments related to AI have led to projections that most jobs will be filled by machines rather than people within the next 100–120 years. In particular, the short-term socio-political implications will create enormous problems as people lose their jobs, imposing a significant burden on the social welfare funds of many states, along with the psychological difficulties that come with losing a job to a machine. The midterm and long-term sociopolitical forecast could bring some improvement, since the use of machines could eventually provide for all necessary wealth. This is, at least, the grand vision of using AI for the good of human society.

The future of work is a hotly debated topic among scholars such as Danaher (2019) and Gheaus and Herzog (2016). They have examined, for example, whether AI will cause widespread “technological unemployment” (and, if so, to what extent) and whether less work will be generally preferable. In addition, vital questions concerning work as a meaningful and fulfilling activity that protects people from “existential boredom” are frequently discussed in the literature, most famously by Bloch (1954).

## Ethical Limits of AI-Supported Business

Using AI for various human activities offers numerous advantages and can improve our quality

of life in both professional and personal settings. However, the abovementioned examples reveal that some applications can have substantial negative moral implications. In the USA, many people have been treated unfairly by AI systems regarding employment, loan applications, and parole based on their ethnicity (Angwin et al. 2016). This is immoral and violates these people's rights to be treated without discrimination based on ethnicity, sex, skin color, medical impairment, or other factors. In other words, AI-related applications might undermine the very foundation of our society by reinforcing social injustice and thereby becoming complicit in racism (Gordon and Nyholm 2021, section 2c).

Furthermore, maximizing profit in business is not necessarily bad but provides a great utility to many people. This approach has been often related to utilitarian ethics, which claims that one should always choose those actions which bring the most utility for all sentient beings involved. However, what is the utility for people who have been rejected unjustly for a loan or a job due to personal factors that should not prejudice their opportunities? The idea that some things should never be done – e.g., we should not discriminate based on ethnicity, sex, skin color, or medical impairment – has been part of deontological ethics for many decades. It is often used as a rival proposal against the utilitarian strategy of maximizing profit. In other words, using AI software in companies in ways that lead to immoral outcomes is a crime. It profoundly undermines the moral demands of our social relations to treat each other with equal respect and fairness in society.

The task of business ethics in the context of AI is, among other things, to assess the moral values, norms, and ethical principles involved in doing business. Identifying instances of injustice and inequality is undoubtedly a critical task, after which guidance toward suitable solutions is needed. The latter point has been discussed under the heading of “programming ethics into the machine” so that the software can navigate moral problems and use proper ethical reasoning and moral decision-making for its tasks (Gordon 2020b; Anderson and Anderson 2011; Wallach and Allen 2008). It remains to be seen whether

we will be able to solve this problem effectively in the near future and thereby avoid perpetuating injustice.

## Conclusion

Undoubtedly, AI has tremendous impact on how business is done today. One way to evaluate moral problems in this context is by the application of business ethics to pinpoint the issues raised by the unfiltered application of AI software and to devise appropriate responses. This is not an easy task. Proper solutions for many of the problems mentioned above will require collaboration across different disciplines such as AI, robotics, computer science, philosophy/ethics, and law.

## Artificial Intelligence and Ethical Journalism

Konstantin Dörr  
Berlin, Germany

### Synonyms

Agency; AI; Algorithmic journalism; Automated journalism; Cyber ethics; Journalism ethics; Responsibility

### Introduction

Journalism is a mode of communication that provides the public verified facts and information in a meaningful context so that citizens can make informed judgments about society (Pew Research Center 1999). It is a journalistic task to select, process, and publish news in accordance with professional norms and values (Brosda 2010). Today, this concept is more than ever threatened. With the advent of artificial intelligence applications and the use of digital data in journalism, the nature of how news is selected, produced, distributed, and consumed is changing. Algorithms are influencing and structuring our daily life. They determine search results on Google, they decide and recommend which news stories are worth reading and how they should be consumed, and they predict the demand for specific journalistic products and are even able to create written content via natural language generation (NLG) applications like Generative Pre-trained Transformer 3 (GPT-3). The use of this technical potential in journalism as well as the observation of its challenges in journalism research has been conceptualized in numerous ways, including “computational journalism,” “computer assisted reporting,” “big data or data journalism,” or “algorithmic or automated journalism” (Dörr 2016a, b). Each of these concepts focuses on different use cases of data and levels of automation. It ranges from research methods, to story visualization and data analytics, to automated

text generation. These concepts and their operationalization show one thing. It is difficult to determine the ethical impact of algorithmic applications as the ethical discussion on technology calls for specific technical knowledge about the research subject. These research objects are dynamic in their nature. As Guzman (2021) notes, “technological change has the potential to challenge existing norms and values within journalism”; the need of an ethical discussion on how professional journalism can maintain its quality standards of objectivity, accountability, and transparency is more relevant than ever before. Thus, this chapter provides a short overview of how it is possible to assess and analyze ethical challenges of artificial intelligence applications from a theoretical perspective.

### Artificial Intelligence as Challenge for Ethical Journalism

Even though the field of artificial intelligence (AI) officially started in 1956, there is to date no all-encompassing definition of AI that satisfies every research area. From philosophy to biology and computer science, the approaches to grasp and discuss the topics are versatile (Bringsjord and Govindarajulu 2020). Following the definition of Russell and Norvig (2009) that is widely reflected across literature, AI is “the designing and building of intelligent agents that receive percepts from the environment and take actions that affect that environment.” Algorithms classify, structure, and filter digital information – depending on the function of the application – and assign relevance to it based on programmed rules.

Recently, the development of AI applications gains traction with the invention of algorithms in the subfield of machine learning. As Bringsjord and Govindarajulu (2020) sum up, “Machine learning is concerned with building systems that improve their performance on a task when given examples of ideal performance on the task, or improve their performance with repeated experience on the task.” Over a certain period, the range of actions and thus the possibilities to fulfill a specific task are growing constantly. This

increasing complexity in human-computer interaction is challenging the way in which we assess and analyze normative and ethical challenges of digital news production (Dörr et al. 2017).

Focusing on journalism, there are different levels of automation in professional news production. One development that encompasses and covers most likely forms of AI and machine learning is the area of automated or algorithmic journalism (Dörr 2016a). Closely linked to the field of computational linguistics, software applications generate editorial texts based on natural language processing (NLP) from structured data almost independently and with small differences in quality. The latest technological evolution in text automation is GPT-3. Generative Pre-trained Transformer 3 (GPT-3) is a language model that uses machine learning to perform a large range of natural language processing tasks as well as to produce humanlike texts. This software is developed by OpenAI, a San Francisco-based artificial intelligence research laboratory (Brown et al. 2020). The use of these applications – although not yet widely used – is economically driven. On September 23, 2020, GPT-3 was licensed exclusively to Microsoft (Hao 2020).

Among other challenges, high costs for training the algorithms and textual limitations due to the lack of world knowledge complicate the distribution and usage of this technology. Nevertheless, the use of this technology and the ability to write quality texts could lead to potential misuse. Examples include misinformation, spam, phishing, abuse of legal and governmental processes, fraudulent academic essay writing, and social engineering pretexting (Brown et al. 2020: 35). The researchers behind GPT-3 also address forms of bias as a potential risk as the software could generate stereotyped or prejudiced content. These are questions of governance of AI applications in journalism.

### Ethical Criteria in Journalism

In journalism ethics, the normative assessment of journalistic action always refers to the assurance of quality. Quality in journalism describes the fit

of journalistic services to defined quality standards. Ethical criteria such as respect for truth, respect for human dignity, and truthful information of the public are among the basic norms of journalism (Dörr et al. 2017: 130). Norms are generally applicable regulations for human action that follow social values. Values, on the other hand, are desired social conceptions, which are used to establish or legitimize norms. Only the truthful, transparent, appropriate, and comprehensible communication of information makes it possible to provide real orientation and is a prerequisite for opinion forming and a basic condition for the implementation of democratic principles. These core principles need to be addressed when researching AI applications like GPT-3 for editorial automation.

### Analyzing AI Applications from an Ethical Perspective

As computing technology in general is normative and expected to proceed toward a pre-defined goal, AI applications are different as the final goal is not pre-defined. This challenge leads to questions of technical design that need to be evaluated regarding ethical norms. But the challenges for analyzing ethical implications of AI applications in journalism are multilayered. Algorithmic processes are often invisible and need to be deconstructed in order to be analyzed and to provide ethical guidance. This approach is part of studies in technology assessment. The deconstruction can lead to decision trees that help to visualize decision-making rules. It can visualize questions of responsibility as it highlights who is responsible at which stage of the production process. In terms of technological design, it can be helpful to integrate ethical requirements and normative constraints while conceptualizing journalistic AI applications such as GPT-3.

In general, the influence of AI algorithms and the increasing use of digital data are addressed by various researchers (see Dörr and Hollnbuchner (2017) for an overview; Guzman 2021). They detect ethical challenges in journalism at the level of data search, origin, and use; algorithmic

accountability and responsibility; algorithmic authority; algorithmic objectivity; and algorithmic transparency (see Dörr and Hollnbuchner (2017) for an overview; Guzman 2021). While these challenges are discussed and located within media ethics, focusing on journalism ethics as reference points (Dörr 2019), researchers also focus on concepts within the fields of science and technology studies as well as cyber ethics (Dörr and Hollnbuchner 2017). Focusing on cyber ethics, other applied fields of ethics are also considered for the ethical discourse on AI applications in journalism. These are, in particular, “computer ethics” which refer to moral issues concerning computing, as well as “information ethics” which refer to moral issues concerning the flow and the processing of information. Furthermore, “internet ethics” refers to dealing with ethical issues concerning the internet while focusing on connectivity and the technological fundamentals. More recently and more relevant for AI applications the fields of “machine ethics” or “robot ethics” are dealing with the ethical behavior of artificial intelligence systems and agents (see Dörr and Hollnbuchner (2017) for an overview). Research shows that it is valuable to include other ethical approaches in order to open the ethical discourse in journalism (Guzman 2021). Of course, this approach does not free media ethics from providing a normative quality assessment of AI along scientifically plausible, normative criteria.

For example, in the media ethical discourse, a concept of responsibility is used that includes different actors – media makers, the owners of mass media, and media users. This differentiation of the media system enables the distribution and attribution of responsibility at the individual ethical and social ethical level. The increasing differentiation of journalistic tasks with the use of AI applications leads to questions whether and how human beings or technology is assigned with responsibility. As ethical questions of responsibility were only linked to a human being – only a human actor can act reasonably, research is already addressing the impact of AI and responsibility, for example, with focusing on socio-

technical approaches of the role of technology, e.g., the actor-network theory by Bruno Latour.

## Conclusion

Due to the development in information and communication technologies, the field and cluster of ethical problems are dynamic. It is necessary to apply normative quality demands from a media ethical perspective also to new phenomena like GPT-3 and other AI applications in journalism. But this scientific and journalism-centered perspective can benefit from opening the discussion of ethical challenges of artificial intelligence to other fields of applied ethics such as cyber ethics and machine ethics. With algorithms that act automatically and are becoming increasingly independent in their decision-making and evaluation options, the role of technology as an actor is starting to be included in the ethical discussion alongside non-journalistically socialized actors such as software providers or programmers.

## Artificial Intelligence and Teaching Values in Science

Mairéad Hurley and Grace D'Arcy  
Science Gallery at Trinity College Dublin,  
Dublin, Ireland

## Synonyms

Cross-disciplinary understanding of values/ethics in science and technology

## Introduction

Experiences that integrate art and science and that deal with future-facing topics can be vehicles for engaging the public with ethical issues and questions in an equitable and accessible manner. Such experiences can open the door to discussion and debate and are a step removed from didactic approaches to science communication. The process of creating transdisciplinary work that integrates the arts, science and technology can allow a deep exploration of the moral and ethical issues at play for the artists, researchers, scientists and technologists who create the work. Involving the public in the development of such work through an open, transparent, participatory and collaborative process adds a further dimension that values the contribution of the lay member of society alongside that of the scientist and the artist. In this article, Science Gallery Dublin is presented as a space for the incubation and activation of work engendering critical ethical conversations at the intersection of art, science, technology and society.

## Science Gallery Dublin: A Living Experiment

In 2008, Trinity College Dublin founded Science Gallery as a cultural space with a focus on engaging young adults in conversations about art and science (Gorman 2020). With Ireland having no national science museum, the idea behind Science Gallery represented something of a risk – attempting a new form of public engagement with a rapidly changing programme of exhibitions and events (Brunswick 2017). Not only did the public respond in staggering numbers (more than three million visitors in its first decade) but the unqualified success of a university-linked art-science cultural space resulted in the founding of an international network to support the establishment of Science Gallery nodes around the world. At the time of writing, leading universities in London, Melbourne, Bengaluru, Venice, Detroit, Rotterdam, Atlanta and Berlin have

joined the Science Gallery Network along with the founding member Trinity College Dublin.

Science Gallery Dublin brings together artists and makers as well as researchers from across disciplines and provides a platform for the development and exhibition of new transdisciplinary work in response to broad themes. A season with the title *FAKE* could feature exhibits related to biomimicry, psychology or food science to name just a few of the subthemes which emerged when this topic was addressed in 2018. In an approach that highlights its role within a university, rather than being an isolated space for public engagement, an exhibition in the gallery space may also be used by the academic community to collect or refine data to help generate new scientific results for publication. *SocioPatterns* was an experiential exhibit as part of the *Infectious: Stay Away* exhibition in Science Gallery Dublin in 2009. Visitors wore electronic badges as they moved through the exhibition space, and a sensing platform detected close-range proximity among individuals. This data was used to generate high-resolution visualisations of a virtual epidemic (Van den Broeck et al. 2012).

## Art, Science, Technology and Ethics

When the term “scientist”, first coined in 1833 by Cambridge historian William Whewell (Snyder 2019), was discussed in Blackwood’s Edinburgh magazine in 1840, the anonymous author described Leonardo da Vinci as “a seeker after truth” – namely, a scientist – while artist Corregio was described as an “assertor of the truth”. The distinction made by the author was that “the end of science is to find truth: art assumes that it is found” (Blackwood’s Magazine 1840). In the intervening 180 years, many artists, scientists and scholars have explored variants of these definitions and distinctions, famously described in 1959 by C.P. Snow as *The Two Cultures* (Snow and Collini 2012). Science Gallery founding director Michael John Gorman provides a comprehensive overview of the field of art-science and the varying terminology used to describe the combination of science and the arts in his book *Idea*

*Colliders: The Future of Science Museums* (Gorman 2020).

An argument for artist-scientist collaboration is often centred around the potentially critical role of artists and designers acting as “early warning systems”, imagining consequences of unchecked scientific or technological advances before these are even fully realised in the lab, and confronting society with visions of such futures. Encountering works such as Eduardo Kac’s Alba GFP Bunny – an albino rabbit which glowed green due to the insertion of a jellyfish gene for green fluorescent protein into its DNA – or the sight of a lab-grown ear attached to the arm of artist Stelarc invokes strong emotions such as fear and disgust (Gorman 2020). As noted by this author, such works tend to be more sensationalised by the media and the emotional response more visceral when the subject matter relates to biological phenomena rather than to technological advances. However, as algorithms become increasingly pervasive, and more and more aspects of our lives rely on technology, art-science exhibitions increasingly feature works by artists and collectives who creatively utilise digital data, algorithmic tools and technology. Such artworks, which serve as a commentary on the world we inhabit, i.e., networked, under surveillance, and reliant on data-hungry technology, are described by Stark and Crawford (2019) as inhabiting “the intersection of aesthetics, ethics and politics”.

Design is also featured alongside art, science and engineering in Neri Oxman’s “Krebs Cycle of Creativity” in her 2016 article “The Age of Entanglement” (Oxman 2016). Speculative design is an emerging field through which products, tools, processes and services are designed for use in a particular probable, possible or plausible future – one which emerges due to the consequences of a particular scientific or technological innovation or advance (Dunne and Raby 2013). Whatever future emerges from our current trajectory as a species, whether or not it is one that we are satisfied with or would even like to imagine at this point, humans will still need “stuff”, and we will need designers to design for this scenario, even if it is not an ideal one. Arguably, if designers are brought into the process at the point when

technologies are still in the speculative stages, they can engage the scientists and engineers in user-centred design processes, which may raise interesting ethical questions about possible use cases and perhaps impact the eventual development of the technology in question. When presented to audiences, works of speculative design or design fiction speak to our identity as consumers and are often intended to make the audience reflect on whether this is a future they would like to live in. Commissioned for the exhibition FAKE at Science Gallery Dublin in 2018, *Phylogenetic Atelier* by Tina Gorjanc (Fig. 1) asks audiences to consider whether the production of “fake” copies of an extinct material is an attempt to understand the past or just an excuse to constantly create the desire for rarity. The project showcases the work of *The Great Passenger Pigeon Comeback* project from Revive & Restore, a foundation aiming to enhance biodiversity through new techniques of genetic rescue for endangered and extinct species. By portraying a speculative venue that simultaneously represents features of a laboratory, a museum and a luxury artisan gloves workshop, this exhibit tackles the ethical and philosophical dilemmas of our fascination with producing new replacements for extinct or endangered biological matter.

As noted by Stark and Crawford (2019), artists who either use the tools of science and technology, or use science and technology as their subject matter, often attempt to “defamiliarise” their audience by “introducing moments of strangeness and alienation to prompt stronger audience reflection”. Strong emotional affect is often generated in such scenarios, and these authors mention that a number of the artists interviewed for their research share a desire to produce a strong emotional response as an ethical impact of their work, e.g. by pushing audiences to examine their relationships with technology. Roeser et al. (2019) argue that works of art which engage with new technologies can prompt moral emotions and hence can help audiences to reflect critically on social and ethical implications of these technologies and to aid in deliberation and decision-making about risky technologies.

**Artificial Intelligence and Teaching Values in Science, Fig. 1** *Phylogenetic Atelier* at FAKE at Science Gallery at Trinity College Dublin

## Engaging Audiences in Ethical Discussions

Exhibitions in Science Gallery Dublin feature artworks which generate this moment of defamiliarisation while simultaneously bringing elements of the everyday into the visitor experience. As described by Bandelli and Brunswick (2020), “To try and create an experience entirely independent of our audience’s real-world experience . . . misses a massive opportunity to utilise familiar aesthetics, to subvert and alter familiar everyday interactions, and to get audiences to interact in ways that are familiar . . . but with a twist that may push them to adopt a critical lens without being pushed so hard they feel estranged or unwelcome.” Examples of quotidian settings in Science Gallery Dublin exhibitions have included a colourful retro diner with a menu of options for visitors to “order” from in an exhibition entitled *FAT: IT’S DELICIOUS*, a deli counter of

synthetic foodstuffs in *FAKE*, or a chance to play apocalyptic board games with staff or other visitors during an exhibition entitled *IN CASE OF EMERGENCY*.

The following section introduces three artworks which have been featured in Science Gallery Dublin exhibitions, selected for their potential to pose ethical and moral questions to audiences. *Stranger Visions*, by US artist Heather Dewey-Hagborg, was shown as part of *GROW YOUR OWN* (2013). The portrait sculptures (Fig. 2) are created from the analysis of genetic material collected in public spaces. Working with artefacts that strangers unwittingly leave behind, this work demonstrates the possible future of forensic DNA phenotyping (a method of determining appearance from DNA) and points to the emerging privacy issues related to the increasing accessibility and decreasing costs of biotechnology. Samples – traces of human DNA found on cigarette butts littering the streets of Dublin – were

**Artificial Intelligence and Teaching Values in Science, Fig. 2** *Stranger Visions* at GROW YOUR OWN at Science Gallery at Trinity College Dublin

brought to a lab, and a DNA extraction was performed. Certain regions of the DNA were amplified using a technique called PCR – polymerase chain reaction. This makes it possible to study certain regions of the genome that tend to vary person to person, known as single-nucleotide polymorphisms (SNP). The allele present for a particular SNP on each sample is determined. Using a custom computer program, this information then determines the values that correlate with physical genetic traits and renders a 3D model of a face to represent them. The model is then exported and sent to a rapid prototyping machine which prints the model in full-colour 3D, which becomes the central part of the artwork as exhibited. The intention is provocation: to confront the viewer with the possibility that someone might be able to examine their DNA and inspect their identity from

**Artificial Intelligence and Teaching Values in Science, Fig. 3** *Second Livestock* at FIELD TEST at Science Gallery at Trinity College Dublin

detritus they didn't even notice that they had left behind.

*Second Livestock* (Fig. 3), created by US artist Austin Stewart, is a virtual reality world for battery-farmed chickens, drawing parallels between how we treat animals and how we treat ourselves. Devised as a parody of an actual virtual reality world for humans, the project attracts audiences into a conversation about the reasons behind and the consequences of people choosing to spend more of their lives in virtual spaces. The speculative design work, shown in Science Gallery Dublin as part of FIELD TEST in 2016, exists as a performance, an installation, and on the Internet and presents itself as eliminating the need for the physical space required for free-range livestock through “Virtual Free Range™”, giving livestock the experience of free-range life while living within the confines of a facility. The artwork can also ask the question: if we are not willing to insist on eggs from chickens who lead a happy life in the countryside, and if battery conditions are unpleasant for us to think about, will our consciences be eased if our eggs come from chickens who at least think they live in a pastoral idyll? The audience was invited to participate in an open discussion and experience the virtual reality world through a prototype of the CCI (Chicken-Computer Interface). This prototype consists of the Oculus Rift VR Headset and a custom-made omnidirectional treadmill. *Second Livestock* went viral in 2014 being covered by many international news outlets. This coverage

led to a grand conversation across the Internet about the ethical implications of virtual reality for chickens and virtual reality in general. A single article about *Second Livestock* posted by popular science website [iflscience.com](http://iflscience.com) to Facebook garnered 50,000+ likes and over 8,000 comments.

The *Situation Room* (Fig. 4) is an immersive experience developed by the Science Gallery Dublin team for a 2017 exhibition entitled IN CASE OF EMERGENCY, within which visitors are faced with complex questions and difficult choices. The intention was “to get strangers talking to each other about the end of the world in the same way they might discuss the weather at a bus stop” (Bandelli and Brunswick 2020), and the initial icebreaking and conversation is sparked through a playful card game which asks players what they would do in case of an emergency. The second stage of the experience is a more serious debate in which visitors take on the role of the

“Catastrophe Citizens’ Assembly” and are asked for their input on a range of catastrophic emergency scenarios. Through game play, voting, and discussion, the Catastrophe Citizens’ Assembly must debate scientific, logistical and ethical issues surrounding some of the biggest risks and threats to human species survival and the continued existence of life on Earth. The experience is mediated by a game show host, role-played by a gallery staff, who pushes the Catastrophe Citizens’ Assembly to reflect on the choices they have made. The questions emerging often included variations on the following: “what if what’s best for you and your family isn’t best for the people of Ireland, for the human species, or for another species?”; “what if a tsunami hits or a pandemic wipes out continental Europe?”; “is unchecked artificial intelligence a bigger threat than a food systems breakdown?” Through a mix of humour and serious debate, the *Situation Room* provides space, context and props for imagining the end of

**Artificial Intelligence and Teaching Values in Science, Fig. 4** *Situation Room* at IN CASE OF EMERGENCY at Science Gallery at Trinity College Dublin

the world and how humanity can act in the best interest of ourselves, our fellow species and the planet that supports it all.

Since its inception, Science Gallery Dublin has used word play and language as a tool to attract audiences and to generate an air of mystery or unpredictability. This has manifested itself in the sometimes ambiguous or deliberately vague titles adopted for exhibition seasons – *INVISIBLE* explored the scientific mysteries of dark matter and dark energy but also looked at systems of oppression and injustice which have led to certain groups or individuals being rendered “invisible” in historical narratives of scientific discovery. This use of open-ended language does not foreground any one discipline. The majority of exhibition pieces are selected through an open call, which invites contributions from artists, scientists, researchers and any other creative producers. In 2021, the deliberately ambiguous topic to be explored is *BIAS*. As artificial intelligence and machine learning become ever more pervasive, users are beginning to understand the importance of the training data input into such systems and the possibility that the technology they use is hard-coded with the systemic prejudices and biases of the society it has emerged from, leading to further injustice (Turner-Lee et al. 2019). Algorithmic bias can particularly affect certain groups of people when systems make inferences about their likely future behaviours based on flawed information reflecting historical inequity. Examples include gender bias in online recruitment algorithms or racial bias in facial recognition technology (Turner-Lee et al. 2019). *BIAS* as a season will also examine data-driven storytelling. Data can tell many stories and can be subject to multiple interpretations, depending on the use of devices and data practices.

For Science Gallery Dublin, the use of the word *BIAS* as an opening gambit aims to invite transdisciplinary exploration of phenomena relating to the topic across areas such as computer science, linguistics, politics, sociology, psychology, neuroscience and numerous other research disciplines. The aim of the programme is to go beyond merely presenting an exhibition and rather provide a platform for public debate and dialogue,

transdisciplinary collaboration and co-creation of new work. This will be seeded through facilitated workshops engaging researchers from different disciplines along with a range of artists and designers, community groups and the wider public in response to the provocation “*BIAS*”, in particular in relation to ethical questions around trust in technology and data privacy issues.

When correctly facilitated to be non-hierarchical, with all participants contributing freely and mutually benefiting from one another, co-creation and co-design can provide a powerful and equitable pathway for involving the wider public in intersectional research and production (Matschoss et al. 2020). Co-creation in Science Gallery Dublin aims to open up the sometimes inaccessible worlds of art and science and give voice to the ethical and moral concerns held by citizens in relation to emerging science and technology, potentially countering any institutional biases within the cultures of art and science. Interdisciplinary and transdisciplinary research are often lauded as solutions to counteract siloed thinking and are the natural antithesis to a one-sided approach to scientific and technological progress, which foregrounds the science and technology while potentially failing to give due consideration to the human, societal or environmental impact of such advances. According to the comprehensive literature review of Vienni Baptista et al. 2020, three discourses summarise the implications of the myriad varying conceptualisations of interdisciplinary and transdisciplinary research:

- The philosophical or transcendence discourse, which aims at unity of knowledge, transcending the narrowness of disciplinary world-views and practices
- The problem-solving discourse, which is oriented to instrumental needs, specifically to cope with complex problems
- The critique or transgression discourse, which interrogates the other two perspectives and emerges out of a fundamental critique of the system of knowledge and education and also relates to discourses on the democratisation of knowledge

In particular, this final conceptualisation is valuable as an approach which can integrate the knowledge and perspectives of arts, humanities and social sciences researchers into transdisciplinary research alongside science, technology, engineering, mathematics and medicine researchers, as well as artists and designers.

Ten leading universities around the world have now joined the Science Gallery Network, recognising the potential for their academic communities to embrace this discourse and to connect with the artistic, social and cultural fabric of their cities, through an accessible platform for public contribution to ethical and moral debates relating to science, technology and the grand challenges of our times. While public mistrust in experts is on the rise worldwide, Science Gallery puts the public on an equal footing with the expert and asks them together to create new ways of meaning-making for a rapidly changing reality. The need for diverse voices in ethical debates and discussions of our time grows ever more critical. As Science Gallery founding director Michael John Gorman so aptly puts it: “In times of ecological collapse and global pandemics, it has never been more urgent to focus on [...] creating new edge spaces, to bring science-in-the-making into contact with policy, to bring research into contact with the public—the future of our planet depends on it” (Gorman 2020, p. 153).

## Asian Journal of Business Ethics

Alex C. Michalos  
University of Northern British Columbia, Ottawa,  
ON, Canada

### Synonyms

Asian business ethics; Business ethics in Asia;  
Journal on social responsibility of business in  
Asia

### Definition/Introduction

This is a brief account of the first journal published that was devoted to the business ethics or socially responsible business in Asia.

### Description

The first issue of the *Asian Journal of Business Ethics* (ajobe) appeared in January 2012, 87 pages of 216 for the full volume. Its basic aim and scope was described by its four coeditors Alex C. Michalos, Allan K.K. Chan, Simon Shun-Man Ho, and Kit-Chun Joanna Lam as a scholarly journal publishing “original articles from a wide variety of methodological and disciplinary perspectives concerning ethical issues related to business in Asia, including East, Southeast and South-central Asia.”

The idea for the journal occurred to its coeditors sometime after the 2010 World Business

Ethics Forum sponsored by the Hong Kong Baptist University and Macau University. This was the third Forum organized by colleagues from these two universities and Michalos, each forum growing greater than the previous one. Given the growth of the World Fora and of businesses in Asia, the founders of ajobe believed that the field of business ethics was bound to continue growing. The creation of an Asian-focused journal seemed to be a natural and necessary development, and the participants of previous and anticipated Fora assured the founders that there was already a network of scholars interested in the initiative. Accordingly, a proposal was made to representatives of Springer Science + Business Media B.V., it was accepted, an editorial board was assembled, and papers called for.

Ajobe appears in two issues per year. Since 2012 there have been 6 volumes, 12 issues, and 76 articles. The coeditors agreed to rotate the position of Editor in Chief among their group, beginning with Michalos and currently with Ho.

The inaugural issue contained papers from the “Third Shanghai International Conference on Business Ethics in collaboration with the Shanghai Association of Ethics, the Shanghai Association of Economics, the University of St. Thomas of USA, and the Euro-China Centre for Leadership and Responsibility at CEIBS” [the Centre for Business Ethics of Shanghai Academy of Social Sciences] (Lu and Lam 2012).

## At the Intersection of Diversity and Ethical Leadership

Joan Marques

Woodbury University, Burbank, CA, USA

### Synonyms

Awakened leadership; Mindful behavior; Moral values; Stakeholder awareness

### Introduction

Diversity and ethics are closely related within the psychological realm of morally responsible behavior, as these two concepts strongly validate one another. Considering still-existing phenomena such as glass and pink ceilings, as well as lingering discrepancies in equally qualified employees' remunerations based on ethnicity and gender, we have to conclude that some rigorous measures are needed. Increasingly, we encounter the terms "diversity" and "ethical performance" in corporate mission statements. We also witness positions such as "Chief Diversity Officer" and "Chief Ethics Officer" in major corporations. These are all responses to a fairly recent past, tainted by dreadful policies and practices. While, however, the above trends signify a positive development, a deeper look into the implementation of diversity and ethics in many corporations leads to the discovery that they are oftentimes implemented in the wrong way and for the wrong reasons.

### A Deeper Look into Workplace Diversity

There are many definitions related to diversity, depending on the context in which it is used. In light of the topic at hand, diversity could be defined as a concept which includes every way in which people can differ (Carrell et al. 2006). Diversity has earned more attention in the past

few decades, as we experienced an increase in human interaction at a level that had not been possible before. This massive exposure has not only given rise to greater awareness; it has also spawned a continuous quest from business leaders for inexpensive resources and lower labor costs. In societal as well as organizational settings there is, additionally, an increasing need for diverse teams to address issues of ongoing complexity (Gotsis and Kortezi 2013). These and other trends result in increasingly diversified workforces at local, regional, and international levels.

Diversity can be an advantage or a problem in any organization, depending on the way it is addressed and the intensity with which it is nurtured. A major factor therein is employees' perspectives of their treatment: when they feel that they have equal access to opportunities and that they are treated fairly, they will feel more satisfied, which causes the diversity implementation to become more successful, because the work progresses and turnover decreases (Chrobot-Mason and Aramovich 2013).

Yet there is no real definition for workplace diversity. The concepts for either diversity or diversity management are too complex to formulate an unambiguous definition (Meriläinen et al. 2009). This lack of a unified definition, especially for diversity management, could be because it is so dependent on the cultural dynamics of different societies and labor markets (Tatli and Özbilgin 2009). Although a clear definition is risky to formulate, workplace diversity includes, among others, people from various ethnicities, genders, responsibilities, cultural backgrounds and statuses, sexual preferences, abilities, and age groups (Harvey and Allard 2008).

As matters currently stand, however, corporations are quick to claim on their corporate websites that they apply diversity, and technically, this claim could not be denied. Yet, the application of workplace diversity does not always happen for the right reasons. When we consider the reasons why corporations – and their leaders – implement diversity, we could produce a long list, varying from very proactive to very reactive. The following section presents a brief review of four

insufficient, yet frequently occurring corporate reasons for implementing diversity.

### **Customer-Based Diversity**

This is when leaders assemble a workforce that reflects their customer base. While this is commendable, it should not be the only driving motive for having a diverse workforce, as its purpose is solely bottom line driven. Leaders in these organizations are not necessarily convinced that diversity is the morally proper thing to do. The only point of concern to them is that their customers feel at ease in the store by recognizing salespeople who resemble them.

When we examine these corporations more closely, we detect that their diversity trend resides at the lower levels where workers meet customers. The controlling mechanisms often remain with a homogeneous group. Unfortunately, homogeneous groups lack the comprehensive depth of diverse team in decision-making, so they unintentionally obstruct the organization from valuable growth opportunities.

### **Single-Minded Diversity**

In single-minded diversity, leaders base their diversity efforts on a unifying ideology, often centered on a single-minded religious, philosophical, or legal motive, to which all employees are expected to adhere. While such initiatives lead to physical manifestations of diversity, it discourages perceptual diversity, which is where the real value of this phenomenon lies. Moreover, single-minded diversity can inhibit employees that don't adhere to the mindset of the leaders, and end in greater turnover. This results in declining profits, because companies with large turnover have to continuously hire and train new employees, which is time and money consuming, and reflects poorly on customer groups who continuously encounter new company representatives.

### **Trend-Based Diversity**

In trend-based diversity, organizational leaders are aware that diversity is a critical trend today. They may have read about it, or witnessed competitors successfully implementing it, so they do it, yet fail to prepare a proper foundation. In some

of these instances, top management mainly gives orders to create a diverse workforce, but further remains uninvolved in the complications of dealing with the workforce. This disconnect may lead to regress instead of progress in the organization's performance, because employees soon sense the lack of support for their divergent perspectives and alternative ideas. As described in single-minded diversity above, the lack of support and recognition will lead to larger turnover and end up costing the company precious time and money to rehire and retrain new employees. This cost- and time-ineffective process may serve as a welcome justification to a diversity-averse top management team to demonstrate that the diversity efforts did not pay off in their corporation. Based on this evidence, the homogeneous, group-think trend can ultimately be restored.

### **Locally Accommodating Diversity**

In locally accommodating diversity, leaders attract employees to serve local demographics in the areas where their organization has performance units, but fail to allow employees to learn from one another or move up through the ranks. In other words, such corporations diversify geographically, thus hiring employees that are deemed "appropriate" on the basis of locally perceived needs. For instance, black employees are hired for the predominantly black areas of operations, gay-lesbian-bisexual-transgendered (GLBT) employees for regions that are known to be progressive in that regard, and older workers are attracted in areas where the population is primarily conservative. The diversity in these types of corporations is solely implemented for local accommodation, thus leading to glass ceilings for some groups of employees. The main concern with this reason for implementing diversity is that everyone tends to stay in his or her corner, and opportunities to learn from one another are limited. Consequently, the deeper advantages of diversity – mutual learning, mindset expansion, greater acceptance, and enhanced insights – remain uncultivated.

### **Diversity as It Should Be Implemented**

Proper implementation of a diversity initiative first and foremost requires the involvement of

leaders. The reasons for engaging in diversity, the short- and long-term consequences for the organization and its stakeholders, and the procedures to follow should be seriously considered, and employees of various backgrounds, religions, age groups, sexes, and other distinctions should be properly guided in the process of acceptance. It should also be understood that conflict is inevitable where different worlds meet, because human beings have an innate tendency to think their way is better than others'. It takes time and tact to change people's perceptions in this regard. Yet, once this occurs, the process of intermingling and bringing to the table the best options of multiple worlds can lead to rewarding outcomes for the organization and all individuals involved. Overall performance improves, and each worker experiences the personal gratification of horizon expansion (Marques 2007).

### Why We Should Embrace Diversity

As a general note, here are seven critical reasons to consider in the process of embracing workplace diversity:

1. In light of ethical leadership, it is just the right thing to do, and leaders should keep track of a proper representation of diversity in their workforce, from bottom levels to top levels.
2. It is an important support mechanism in compliance with diversity and antidiscrimination laws.
3. A company with a diverse workforce has better marketing opportunities, based on the fact that multiple customer groups can identify with the company's workforce.
4. A diverse workforce produces better and more widely considered outcomes, thus guaranteeing more creativity and an increased competitive advantage.
5. Potential employees from a wide range of backgrounds will acquire the desire to work for a diverse company, because it is easy for them to identify with the workforce.
6. Diversity can be a powerful retainer for employees, as they can tell that they are valued as persons in their own right, regardless of whom or what they represent.
7. Diversity may positively impact the bottom line, because satisfied employees are more willing to elevate their workplace to a higher performance plane (*Turning Diversity... 2007*).

### A Deeper Look into Ethical Leadership

Ethics is the general term used in the consideration of good and bad. The complexity of ethics may lie in its multidimensionality: ethics play into all decision areas of our lives. There are some general moral behaviors on which we commonly agree, such as not killing, stealing, or deliberately harming others. Yet, within these common behaviors, there are many gradations, which get even more intricate when we consider the many ethical constructs available.

Two moral theories that are frequently taught in business education are the utilitarian approach, or consequentialism, and the deontological approach, also known as Kantianism or universalism. The utilitarian context encourages us to make decisions that lead to the greatest good for the greatest number of people. This entails that if we would have to sacrifice the well-being of a few to save a large number of people, we perform within the moral boundaries of utilitarianism. Conversely, the deontological context teaches that we should always do what is right, regardless of the outcome. The underlying thought in universalism is that we should always do what we would want to be a universal rule and never use anything or anybody as a means toward selfish ends. Instead, we should treat all beings as ends themselves. The above explanation of merely two ethical theories demonstrates the major differences that exist.

Ethical theories vary in age, applicability, and appeal, depending on who considers them. Some of the long established moral theories are the Golden Rule, which assumes that we should not do unto others what we would not have done unto ourselves, and the virtue approach, originated by Plato and Aristotle, and which is based on moral character. A theory that has been established in more recent times and is still evolving is "Ethical

Egoism,” first described by Ayn Rand, and assuming that rational human beings will make decisions that suit their personal long-term interest, while maintaining harmony with one another (Marques 2012).

In regard to business ethics, we have been shaken to the core in the past decade by numerous immoral scandals from corporate leaders in major corporations. Corporate immorality often translates into dire consequences for those who are their direct or indirect stakeholders. This became painfully clear during the 2008 economic meltdown caused by unethical practices in the financial industry, and resulting in a globally noticeable domino effect. Millions of people who thought that their lives were secure were suddenly jobless, homeless, and prideless (Marques 2012). This fairly recent sequence of events has left us wondering whether there is such a thing as “corporate ethics,” or whether corporations and ethics are actually mutually exclusive. The short-term profit mindset has become so prevalent on a global scale that long-term considerations seem to be a thing of the past.

Below, we review four moral pitfalls that many corporations struggle with.

### **Reactive Moral Behavior**

Morally reactive leaders choose for this strategy because, especially in heavily capitalist-focused nations such as the United States, it is less costly to simply wait for a catastrophe to happen and pay the fines, than to do the morally right thing right away. When corporate leaders engage in reactive ethical behavior, they can expose their organization, but also people (and other living beings) inside and outside of the work environment to major risks (Kyrtis 2011).

### **Cognitive Dissonance Driven Ethics**

The ethical cognitive dissonance conundrum surfaces when leaders struggle with the discomfort of contradictory beliefs or values at the same time, and possibly engage in actions that are contrary to their intuitive senses. It often turns out that they make group-based decisions, promulgated by the sense of “us” versus “them” – decisions which they may later utterly regret. This happens, for

instance, when corporate leaders fail to admit a flaw in their product, despite numerous accidents or deaths, because they are torn between their legion of engineers and marketers (“us”) and an increasingly dissatisfied crowd of customers and community members (“them”).

### **Legally Driven Ethics**

In the case of legally driven ethics, organizational leaders attune their degree of moral decision-making to the legal standards in any country in which they operate. As a result, the moral standards held by these leaders in, for instance, developing nations are far below those they hold in industrialized ones.

### **Laissez-Faire or Misinterpreted Ethics**

In such cases, the leaders may either allow different ethical standards for different performance units based on local managements’ moral compasses (or the lack thereof) or hold on to their own interpretation of existing moral theories. While this *modus operandi* may work well for some time, there is significant potential for problems when leaders fail to define at least some fundamental moral stances for their work community. As explained earlier, moral theories differ significantly, and adhering to different theories, for instance, utilitarianism versus universalism, can lead to completely diverging actions.

### **Five Points to Consider About Ethics**

1. “Legal” is not the same as “ethical.” Something can be legal but unethical or the other way around. For example, working in the weapon, alcohol, or tobacco industries is legal. Yet, increasing crowds categorize these businesses immoral because of the effects their products have on our well-being.
2. Differing cultures call for different ethical performances. What is unacceptable in one culture might be normal in another, such as child labor, sweatshops, and bribes. Moral boundaries tend to be stricter in countries that are economically more advanced.
3. Perceptual differences may complicate our interactions. We all have our own mental model of the world. These divergent

perceptions are not just provoked by the amplified diversity in today's work environments but also by the broad variety of our ethical stances.

4. Business ethics are continuously challenged by competitive practices. It can therefore be a tough choice for companies to engage in moral practices completely and still remain in the market.
5. Ethical behavior in any group setting must be encouraged by the leadership team. While people may hold their own moral ideas, they usually follow the common guidelines when part of a larger group. A leader's actions are usually the best indicators of the ethics within his or her organization.

### At the Intersection of Diversity and Ethical Leadership

Considering diversity and ethical leadership as strategies for successful and sound performance, there are some common aspects that need to be adhered to:

- Diversity and ethics are most successfully implemented if there is serious and proactive involvement from leaders.
- Practicing diversity is the morally right thing to do, while moral performance is implemented in a diversity of ways.
- Neither diversity nor ethical conduct can be applied as a superficial coating over a corporation's performance, as this will lead to more damage than advancement.
- The level and care of implementing diversity and moral performance in any organization can critically influence the organization's performance. When diversity is implemented for the wrong reasons, employee discontentment rises, leading to increased turnover rates. Similarly, when ethical standards are nonexistent or not followed, employees and other stakeholders find out, which causes even the most successful company to ultimately perish.
- Diversity and ethical performance are both major advantages for a company's reputation and performance if implemented well.
- Diversity and ethics require a courageous and determined approach. They are long-term anchors that demand investment of time, funds, and attention, and a solid, ongoing guidance process.
- Diversity and ethics should be consciously and regularly reevaluated, even if the company has a well-organized system in place. Employees come and go, so demographics and perspectives change over time. Regular training is essential.
- Diversity and ethics require a common set of parameters to be implemented successfully, among which, equality, inclusion, care, righteousness, and courage.
- Diversity and ethics are part of the larger constellation of "social responsibility", a trend that

**At the Intersection of Diversity and Ethical Leadership, Fig. 1** Concerns and recommendations for diversity implementation and ethical leadership

is endorsed by increasing groups of leaders but also still ignored by many.

- Leaders that tolerate a diversity-averse mentality, where members of certain demographic groups are enjoying greater advantages than others, are engaging in unethical behavior (Fig. 1).

## Authenticity

Jasmin Dittmar<sup>1</sup> and Michael Dellwing<sup>2</sup>

<sup>1</sup>Department of Sociology, University of Kassel, Kassel, Germany

<sup>2</sup>University of Kassel, Kassel, Germany

## Synonyms

Inwardness; Originality; Realness; Self-expression

## Introduction

Authenticity as an aesthetic category implies an internal state of the individual as a source of originality and uniqueness that can be expressed to the outside (Bohn and Hahn 1999, p. 51). The ideal of authenticity demands that human beings search for their own identity within themselves and articulate it (Taylor 1995, p. 93). Authenticity as an ideal is connected to social developments that arise in the twentieth century: individualization and social differentiation. These pave the way for ideas of personal authenticity as a main topic of modern identity conceptions.

## A Key Concept of Modern Identity

Authenticity is not an isolated ideal, but stands within a narrow connection, within the history of ideas, with the ideal of autonomy as mindful self-determination (Wetzel 1985, p. 7). As a term relating to the individual, authenticity first appears in the Romance era, which sees its apex in the eighteenth and nineteenth century. One of its central characteristics is the juxtaposition of the principle of inwardness of the individual with principles of rationality and its largely impersonal relations (Herma 2009, p. 25). Though versions of this perspective can already be found with Jean-Jacques Rousseau, and especially with Johann

Gottfried Herder (Taylor 1995, p. 38), the current discourse of authentic as “true,” “genuine,” and “intrinsic” arises in the twentieth century (Knaller 2007, p. 22). It paradoxically becomes a normative category, instructing the individual how their self-expression, and finally their being, must be organized to be legitimate in contemporary Western societies, thus giving rise to a presentation (Goffman 1959) and negotiation (e.g., Strauss 1993) of authenticity work (Gubrium and Holstein 2009).

Authenticity entails the demand to become similar to oneself, to find the “true inner self,” to put the search for authenticity and identity into the focus of modern narratives of self (Herma 2009, p. 19), and to live unconstrained through identification with social roles (Ehrenberg 2010, p. 163). It is thus a program of liberation of the self from the constraints of tradition. The growth of individual autonomy brings with it a more personal tone in social life, a more internal tone in action, and a more dispositional state than sheer mechanical obedience (Ehrenberg 2012, p. 495). This is the moment that marks the birth of the modern individual as it starts to think itself as someone who draws the interest of others because she/he is a meaningful and unique individual, not because she/he achieved something meaningful (Trilling 1972, p. 24).

This modern paradigm of subjectivity is based on a program of autonomy with aesthetic foundations (Knaller 2007, p. 142). Within it, the agency of the individual becomes emphasized, with higher levels of responsibility: in a state of autonomy, the “self” must assert itself, one’s personality must show itself, and the individual must reflect itself; it must appreciate and value itself (Ehrenberg 2012, p. 495). It requires a load-bearing narcissism in order to be able to act. The resulting discourse on authenticity thus describes a certain positive quality of the individual’s relation to itself and is normative in the sense that it suggests that the individual will have a full, successful, and happy life if it acts as authentically as possible, as often as possible (Strub 2009, p. 39).

## The Paradox of Authenticity as a Cultural Norm

Authenticity, then, is a normative category: it regulates how an individual should be and serves as a prerequisite for successfully constructing one’s identity.

Lionel Trilling (1972) notes that the last three centuries saw a shift from sincerity to authenticity. In the frame of sincerity, to follow the moral call to be true to oneself means to avoid falsehoods and deceptions toward others (Trilling 1972, p. 9). With the shift from authenticity to sincerity, the balance between the general-social and the personal-individual is replaced by a strong emphasis on the latter. Authenticity becomes both the means and the end of “being true to oneself”; thus, it starts to function as a category that compensates for frustration. It rescues the individual, overtaxed by modern expectations, by assuring it that the true self is not social at all (Strub 2009, p. 41). To the eyes of contemporary Westerners, this shift seems like the advent of the unity of person and self and thus like the fulfillment of a long-desired wish. Trilling consequently concludes that the popularity of the discourse of authenticity in the present is no great surprise. However, with it comes the experience that localizing the self is impossible in the absence of any external reference (Strub 2009, p. 41).

This foregrounding of a quasi-natural, personal authenticity takes a measure of the individual by assessing the freedom of contradiction in the self, recurring to formulas such as “true,” “real,” “genuine,” etc. (Herma 2009, p. 58, p. 93). However, the norm to “be sincere to oneself” gives rise to an indelible contradiction. If we want to be authentic, we may not be like another. The question Trilling raises is how to get there. The conventions that cultural images of authenticity bring are devoid of all content, since that is exactly what one has to find for oneself without orienting oneself to any prescriptions. Being a self as a true and singular entity is now the only prescription to follow; the authentic self now has to paradoxically rely on something that it does not know what it is but at

the mercy of which it nevertheless finds itself (Strub 2009, p. 42). “If one is true to one’s own self for the purpose of avoiding falsehood to others, is one being truly true to one’s own self?” (Trilling 1972, p. 9). This difficulty arises when private and public mix, where “true sincerity” toward oneself is impossible if the moral aim includes a public goal (Trilling 1972, p. 9). Yet, the pursuit to solve the mystery of the self has continued unabated. In Freud, it has even found a protagonist who founded an entirely new academic discipline in search for the self, and still, “we are still puzzled to know not only the locus of the self to which we are to be true, but even what it is that we look for” (Trilling 1972, p. 5). The contradiction has remained dormant, since, as Trilling notes, authenticity as a social imperative has been much more successful in camouflaging itself as such than older such imperatives (Trilling 1972, p. 161). One could also say that the negotiated social meaning of “contradiction” does not, usually, arise in contemporary everyday life, except when the streamlined nature of modern authenticity becomes notable with cynical, ironizing discourses of the 2000s: “I’m unlike everyone else, just like everyone else.”

Alain Ehrenberg (2012) arrives at a similar conclusion by tracing the development of the “American spirit” from character to personality. While character, as an ideal of the individual self, has a moral dimension strongly connection to ascetic Puritan ideals, personality has a psychological dimension and marks the ideal of self in a culture that lays emphasis on personal fulfilment (Ehrenberg 2012, p. 67 f.). Ehrenberg thus gives us the personal equivalent of the change in frame Trilling describes: While the ideal self was once forged as character, oriented to the ideal of sincerity, personality is oriented to the ideal of authenticity. Clear moral prescriptions that told the sincere character how to be, how to act, and how to feel now give way to the imperative to be an independent and self-governed personality: an authentic individual that finds the sources of its being and its actions within itself rather than in external prescriptions. Ehrenberg identifies this internal self, which used to be the traded under

that brand name of “soul,” as a constructed fiction: the spirit, the psyche, and the mental self are terms modern humans utilize to describe what happens within them and in being so used gain their semantic reality and their normative power (Ehrenberg 2010, p. 10). As a term of ascription – and a value judgment – for individuals, authenticity as a term does not enable the individual to arrive at general and intersubjectively anchored descriptions of itself: its paradoxical foundation allows no sustainable definition of self. Knaller (2007, p. 22) notes that it is impossible to live authentically if “I can only define authenticity in recourse to myself ... as an autological, recursive term, authenticity is frozen in paradox,” and individuals are tasked with constantly solving this paradox – again, for themselves.

## Managing Authenticity

Theoretically, the paradox described above cannot be dissolved. However, the individual’s self-presentation is geared toward fulfilling the expectations of an audience (Goffman 1959, p. 35). The model thus demands its application not merely in the individual’s self-image but also in everyday interaction. In order to be effective, cultural ideas need to be embodied in social practices (Illouz 2007). This raises two questions: What reference points does the individual use in search of its inner’ self and its authentic being? How does this presentation of self enter the plane of social interaction?

The age of authenticity comes with an appreciation in value of emotions. While earlier conceptions of personal subjectivity include cognitive, normative, and affective elements of the self, more radical forms of subjectivism see affectivity as the only authentic self-reference of a person (Schimank 2002, p. 80). In the 1970s, Ralph Turner notes “substantial shifts away from an institution towards an impulsive emphasis” (Turner 1976, p. 997). The second half of the twentieth century thus sees an intensification of subjectivism toward an emotional decisionism (Schimank 2002, p. 80).

To be able to assure oneself of one's individual authenticity, one must be certain that one's actions mirrored one's feelings – independently of the question whether they fulfill the expectations of others involved in the situation. In a society geared toward personal authenticity, an action is not good in itself but only becomes so through the personality of the individual that engages in it (Sennett 1992, p. 26; Sennett 1992, p. 11). In an environment where authentic expression is the norm, breaking social expectations in the name of one's own feelings then does not necessarily lead to social sanctions but can be justified with one's own authenticity and can even become a source of and cause for respect. The authentic self finds its true expression where it loses grasp of its expressions, in what Goffman had still called “flooding out” (1959, p. 55). This gives rise to an industry of distrust that perfects the techniques of locating the “true” self behind the official presentation (Strub 2009, p. 42). This concentration on inner selves leads to “mental self-optimization” as an answer to the question, “what is a correct life?": Being in accordance with one's feelings transform the present to a therapeutic society, the search to “be at peace with oneself” as the most important aspect of a life well lived (Lasch 1980). Eva Illouz (2007) speaks of “the rise of Homo Sentimentalis” as characteristic for the current conception of the subject.

Where self-actualization through a complete fulfillment of one's own personality and “potential” becomes the main engine of life, behavior that hinders such fulfilment becomes “emotionally unhealthy” (Illouz 2007, p. 47). The norm of authenticity unfolds its power over the structure of actions through a constant survey of the self, propelling individuals to make sure that their “true,” “own,” “inner” feelings stand in the center of their lives. From a perspective of cultural criticism, such endeavors are bound to fail, since “the more privatized the psyche, the less it is stimulated, and the more difficult it is for us to feel or to express feeling” (Sennett 1992, p. 4).

In order to ensure the appearance of the authenticity in the presentation of self in social interaction, this presentation should match the

biographical, psychological, and physical idiosyncrasies of the presenter – as ascribed by others (Knaller 2007, p. 22). The formulation “appearance” here already points to a specific achievement embedded in this expectation: The individual must stave off the impossibility to find such an authentic, true self dramaturgically and bridge the difference between it and the cultural ideal. Since the self as a role presented by the individual is nothing organic, but a dramaturgical effect that unfolds within a scene, the problem is believability (Goffman 1959, p. 213). The view thus shifts, from what *is* authentic to what *looks* authentic: The actor can be seen as believable, here: as authentic, if certain actions are enriched by something that can be identified as “personal” and specifically particular to the presenter.

Associating authenticity with the call to be true to oneself implies a double achievement: On the one hand, the audience must be able to recognize a coherence between current and former presentations of self, and the hopes and wishes we formulate for the future must fit the image others have constructed of us. On the other hand, this presentation may not calcify so much, as the benchmark for believability lies in the ascription of an identity between presented and “real” feeling (Trilling 1972, p. 2). This, in turn, gives rise to the expectation of a continuous renewal of the person in relation to an emotional frame of justification. This does not mean that fixed convictions cannot be seen as “authentic”: An individual can be believable precisely because it is identified as one that keeps to its known convictions. Any change in expression or moral stature requires a justification in a shift in its inner life.

This emotional frame of justification makes the current ideal of an authentic personality much more plastic than its predecessor, the individual limited through disciplinary fences. Just like current norms order the individual to “become oneself,” past norms ordered it to be disciplined and accept its role, while there is no reason to assume that the disciplinary frame produces less subjective experience than the authenticity frame. “The personal” is a normative artifact and, like all

normative artifacts, it is wholly impersonal (Ehrenberg 2010, p. 122).

## Synonyms

Authoritarian leadership; Domination; Power-over subordination

## Introduction

Autocratic leadership is a type of leadership style in which the leader asserts absolute power over their employees and demands complete obedience from their employees (Cheng et al. 2004; Ertureten et al. 2013). This style is also often referred to as authoritarian leadership, and both terms are somewhat synonymous. Leaders who adhere to this style of leadership often centralize their decision-making and desire power and control over their employees. An autocratic leader creates a “clearly defined intra-team hierarchy” (DeHoogh et al. 2015), and this is strictly adhered to by the leader. Any breaks or disobedience with this hierarchy is not tolerated and can lead to detrimental consequences for employees.

Autocratic leaders make decisions based on their own ideas and judgments and rarely consider or accept advice from their employees and subordinates. Autocratic leaders are known to be dominant, and this dominance results in significant negative associations with subordinates' motivation (Fiaz et al. 2017). Given their leadership style, an autocratic leader may negatively influence employees' work climate and performance (DeHoogh et al. 2015). And of course, given this personality, autocratic leaders are extremely controlling and dominant (Schuh et al. 2013) when it comes to managing employees.

## Autocratic Leadership and Abuse

Due to their nature and because of power centralization, autocratic leaders have total control over their subordinates' activity without needing to take into consideration any employee input (DeHoogh et al. 2015; Sauer 2011). Additionally, autocratic leaders may be perceived as abusive because of their habit of asserting personal dominance over subordinates and controlling them with threats (Kiazad et al. 2010). Autocratic leaders assume they are more informed than others and so can choose to do things their way (Erturten et al. 2013). Unfortunately, there is a very clear power gap evident between autocratic leaders and followers, which allows those autocratic leaders to make all decisions for everyone in the organization (Aryee et al. 2007). Often, under an autocratic leader, employees will feel like they are being oppressed and dictated to by the leader. This can be likened to a form of abuse, mostly of the emotional kind. One can equate this sort of oppression with burnout, most specifically emotional exhaustion. Any employee feeling emotional exhaustion, which results from their treatment by the leader can be considered to be suffering from abuse.

Due to having limited opportunities to make decisions under an autocratic leader, employees feel the lack of autonomy. This can be seriously damaging to employees' self-worth and their ability to contribute meaningfully in the workplace. It is clear employees under autocratic leadership tend to find their need for autonomy unfulfilled. Need for autonomy is tied in with empowerment, and a plethora of research (Amor et al. 2021; Wu and Hu 2009; Yin et al. 2017) has shown that empowerment is positively linked with employee self-esteem and employee engagement, while a lack of empowerment leads to discontent and increased levels of turnover. Abuse does not have to be physical in nature, but instead, a vast majority of the abuse in organizations is of the emotional variety.

Under autocratic leadership, employees feel that they cannot portray their true self in the workplace. Autocratic leaders have a detrimental impact on the work of their employees. Even in

cases where employees are passionate about their work, autocratic leaders can quickly become the reason these employees quit. Many research studies have indeed documented that companies with autocratic leaders tend to have higher rates of turnover, which is understandable, because after all, not many people would want to suffer through emotional abuse.

Vugt et al. (2004) states autocratic leaders are less likely to have a stable group of employees, especially in voluntary groups because employees do not feel loyal to the group, due to the dictatorial nature of the leader. Autocratic leaders keep their employees restricted and do not take their opinion into consideration, which additionally weakens employee morale as well as reduces their loyalty. This restriction of their employees is again reminiscent of abuse.

Therefore, the vast majority of extant research suggests that autocratic leadership is positively related with employee abuse. The abuse does not need to be physical in nature, as emotional abuse can be equally and incredibly debilitating. Therefore, organizations which have autocratic or authoritarian leaders should be mindful that such leadership styles have the potential to cause immense abuse toward employees, and that can eventually backfire spectacularly on the organization itself.

## Autonomy and Advertising

Timothy Aylsworth

Florida International University, Miami, FL, USA

### Synonyms

Freedom; Independence; Marketing;  
Manipulation

## Introduction

Autonomy is an agent's capacity to govern herself; it is the ability to make choices based on one's own beliefs and desires. Several ethical theories assign moral significance to this capacity for self-government; they claim that we have a moral obligation to respect people's autonomy. According to such views, it would be morally wrong to undermine someone's autonomy by means of coercion, deception, or manipulation.

This commitment to the moral importance of autonomy has led to some concerns about advertising. According to one popular objection, persuasive advertising is morally problematic because it has the potential to undermine the audience's autonomy (Crisp 1987). Others have argued that advertising does not violate the audience's autonomy and it might even enhance people's ability to set and pursue their ends (Arrington 1982).

At the heart of the issue, there are debates about autonomy and manipulation. The disagreement involves a dispute about what kinds of external influence should count as manipulation. In addition to informing people about the existence of products, services, and ideas, advertising also attempts to persuade the audience, to instill desires in them. But not all persuasion is morally problematic (since rational persuasion is typically seen as permissible), so the moral question about advertising is ultimately a question about the nature of autonomy and manipulation.

## Autonomy, Manipulation, and Alien Desires

Autonomy is generally defined, as it was above, in terms of self-government. Understood in this way, there is a helpful analogy with the idea of the state (see chap ► “Autonomy and Informed Consent”). A sovereign state is one that is self-governing; its policies and laws are not controlled or excessively influenced by another nation. When extended to individuals, this might make it sound like actions or desires are autonomous only if they are not the product of external influence. This would set the

bar too high, however. People are constantly subjected to a wide variety of external influences, so we must draw a distinction between influences that undermine autonomy and those that do not. This is what theories of autonomy and manipulation aim to do.

Our desires are influenced by a wide array of external forces: friends, family, culture, history, etc. Nevertheless, many of these desires are still our own, and we are autonomous when we act on them. But there are other cases where it is very clear that a person is acting on desires that are not her own. These are sometimes called “alien” desires. Two of the most commonly discussed examples are brainwashing and addiction. An agent fails to act autonomously when she acts on a desire that was the product of brainwashing. Similarly, an unwilling addict lacks autonomy when giving in to a powerful addiction in spite of efforts to resist it (Frankfurt 1971).

Theories of autonomy try to explain what is distinctive about acting on alien desires, and they use this analysis to contrast such actions and desires with autonomous ones. Although several different theories have been proposed, many of them agree that actions are autonomous only if the agent’s mental states are, in some sense, coherent (Buss and Westlund 2018). The autonomy of an action depends crucially on whether or not the agent condones or approves of her motivation to perform the act.

One popular version of this account, following Harry Frankfurt’s influential work, makes a distinction between first-order desires and second-order desires. First-order desires refer to desires in the ordinary sense: Smith wants to eat a piece of chocolate cake; Jones wants to go for a walk; etc. Second-order desires refer to desires about our first-order desires. Smith does not want to have the desire to eat cake because his doctor told him to limit his sugar consumption. Thus, Smith’s second-order desire is inconsistent with his first-order desire (Frankfurt 1971).

Some theories emphasize the agent’s reflective judgments about which actions are best, and others look at the consistency between the agent’s

action and her long-term plans (Buss and Westlund 2018). There are also theories that involve scrutinizing the process through which the desire was formed. According to one approach, a desire is autonomous if the agent did not resist the formation of that desire (or would not have resisted it) when she rationally reflects on the process through which the desire was developed (Christman 1991). This theory allows us to see why desires that result from brainwashing are not autonomous. If a cult member has been successfully brainwashed, then she might have a first-order desire to move to the cult’s compound, and she might even approve of this desire through second-order reflection. Perhaps she wants to have this desire. But if she were to rationally reflect on the ways that the cult leader manipulated her into having this desire, she would reject this process and come to see it as an alien desire.

Other approaches stress the importance of engaging the agent’s rational faculties. On views of this kind, alien desires result from manipulation precisely because of the ways that manipulation circumvents or undermines the agent’s rational decision-making process (Wood 2014). Some of these “rationalist” accounts also emphasize the importance of a certain kind of internal coherence. According to one view, alien desires involve “quasi-beliefs” that are inconsistent with the agent’s other beliefs (Noggle 1995). Quasi-beliefs function like ordinary beliefs in many ways (they can be part of our motivation to act, for instance), but they are importantly different insofar as they were not formed by ordinary cognitive processes and they are not noticeable upon introspection. For instance, Ricardo might see an advertisement for Coca-Cola and form a quasi-belief about how drinking it will enhance his sex appeal. But this belief would not hold up to scrutiny if he were to rationally reflect on it; this belief is inconsistent with other things Ricardo believes. If this quasi-belief motivates him to drink a Coca-Cola, then he has acted on an alien desire.

Finally, it is important to draw a distinction between autonomous *actions* and autonomous *persons*. For the most part, all of the theories

mentioned above are tools for evaluating whether or not a particular action or desire is autonomous. Discussions about autonomy and advertising tend to approach the debate on those terms: They look at desires and actions that were influenced by advertising. But there are others who have argued that an evaluation of advertising requires us to think about autonomy in a deeper sense (Lippke 1989; Sneddon 2001). According to these views, not only we should look at individual actions, but also we should ask whether or not people have the capacity to evaluate and revise and their deepest commitments and their conception of the good life. Autonomous persons are those who are capable of evaluating and pursuing different ways of life in accordance with their freely chosen conception of the good.

## Persuasive Advertising and the Autonomy Objection

Critics of advertising have raised a variety of objections. Some of these criticisms are made on utilitarian grounds: They argue that advertising is harmful to society in some way. For instance, children might come to desire unhealthy candy or fast food as a result of advertising, and this could lead to adverse health outcomes (Gustafson 2021). Even more broadly, targeting children or other vulnerable groups through advertising is a practice that is commonly criticized. It is also generally agreed that false or deceptive advertising is morally objectionable. Other critics focus on the way that it might contribute to racism or sexism, and some have criticized how advertising affects our perception of our own bodies (see chaps ► “Advertising Ethics”, and ► “Advertising Ethics”).

The autonomy objection focuses on a different aspect of advertising, and it is one that is central to the practice of persuasive advertising. Unlike utilitarian critiques, which focus on the harmful *effects* of advertising, the autonomy objection takes issue with the *techniques* employed by advertising. Perhaps the clearest example to draw upon is the commonly cited (although

almost certainly apocryphal) story about moviegoers who purchased soda and popcorn after seeing a subliminal advertisement before the film. Many people find this objectionable because they believe that the audience was manipulated. In a similar vein, critics argue that advertising should be condemned because it is manipulative in some way or another. This criticism is often countered by those who argue that advertising does not work by means of manipulation and thus does not violate our autonomy.

The *locus classicus* of this debate is an exchange between Robert Arrington and Roger Crisp (Arrington 1982; Crisp 1987). Both authors make use of the distinction between first-order and second-order desires. Arrington argued that the first-order desires that result from advertising are perfectly consistent with our higher-order desires. An advertisement might make someone want Coca-Cola, but the agent also wants to have this desire. He argues that most of us accept the desires that advertising produces and that the best evidence of this claim is the fact that we return to purchase these products repeatedly “without remorse or regret” (Arrington 1982).

Crisp and other critics respond by claiming that this analysis is overly simplistic. Crisp points out how most people have a second-order desire that their first-order desires not be products of manipulation. So there is at least one second-order desire that is inconsistent with the desires that advertising produces. He also argues that advertising often works by making appeals to our unconscious desires. If this is true, then advertising would make it impossible for people to reflect rationally on their reasons for wanting a particular product. Unconscious desires are not available to us upon introspection. Desires of this kind are predicated on quasi-beliefs that are inconsistent with rational agency. For these reasons, critics argue that advertising violates our autonomy because it fails to engage with our rational faculties; it circumvents them or subverts them (Crisp 1987; Wood 2014).

Proponents of advertising argue that this gives far too much credit to advertising. Most people are aware of the fact that they are seeing an advertisement, and they are able to make rational

judgments about the desires that are influenced by advertising (Arrington 1982). This defense might not work across the board, however. It is common to make exceptions for children and for those who are especially vulnerable to manipulation. It might also be the case that requiring advertising to engage with the audience's rational faculties over-emphasizes the importance of advertising's techniques. It might be more important to ask whether or not the agent would accept the desire if she were to rationally reflect on the process that produced it (Aylsworth 2022).

Others argue that advertising is morally objectionable, not because it produces alien desires but because it makes it difficult (or even impossible) for us to be autonomous people. According to this approach, looking only at the consistency between first-order and second-order desires sets the bar too low. We might approve of our first-order desires precisely because advertising has convinced us to uncritically accept a consumerist lifestyle (Lippke 1989). Critics of this kind argue that advertising undermines our autonomy not by making us want particular products; it wrongs us by making us the kind of people who want to have materialistic first-order desires. Advertising narrows our conception of the good and weakens our capacity to freely choose different ways of life (Sneddon 2001). They argue that advertising does this by "undermining our openness to other ways of living and by impoverishing our conceptual horizons in such a way that we cannot see beyond the limited confines of consumerism" (Aylsworth 2022).

## Conclusion

In short, the autonomy objection to advertising claims that advertising is morally wrong because it violates our autonomy. Critics argue that it does this by manipulating the audience and producing alien desires. On some versions of this objection, the main issue is the way that advertising fails to engage our rational faculties. It subverts or circumvents them (Crisp 1987; Wood 2014). Others argue that advertising undermines our autonomy by luring us into an uncritical acceptance of a

consumerist lifestyle (Lippke 1989; Sneddon 2001). Proponents of advertising have responded to these objections by claiming that it does not really manipulate the audience (Arrington 1982). They argue that people are not so easy to manipulate, and they do not think that advertising undermines our ability to rationally reflect on our desires. It is difficult to reach a consensus on this issue because there are so many competing conceptions of autonomy and manipulation. In order to reach a conclusion about advertising and autonomy, we must wrestle with some of the deepest and most difficult questions concerning the nature of rational agency.

## Autonomy and Informed Consent

Colin J.H. Thomson

Graduate Medicine, Faculty of Science, Medicine and Health, University of Wollongong, Wollongong, NSW, Australia

### Synonyms

Autonomy: Independence; Freedom

Consent: Accord; Permission; Agreement

### Introduction

Autonomy takes its primary meaning from governmental theory where it refers to the status of a state or nation as being self-governing and free from control or interference from another power. When applied to individuals, the term carries the same meaning: a self-governing person – a personal rule of the self that is free from controlling interferences by others and personal limitations that prevent realization of an individual's self-chosen plan. In this way, autonomy of individuals is regarded as analogous to the manner in which independent governments determine, implement, and manage policies and responsibilities (Beauchamp and Childress 2012).

Consent means the grant, by a person, of permission for something to take place (e.g., to receive medical treatment) or the agreement to do something (such as entering into a contract). The expression includes both the substance – the specification of what is to take place or what the consenting person agrees to do – and also the form in which consent is expressed, namely, whether in a written document or verbally or implied from conduct.

In various contexts of human interaction, different legal principles define what constitutes legally effective consent. This entry focuses on those elements widely regarded as constituting consent that is ethically sound.

## Autonomy

For an act to be autonomous, three components are necessary: volitional, that the person's decision is deliberate; voluntary, that the act or decision is free from compulsion, threats, or coercion; and cognitive, that the individual has the requisite knowledge to make a decision about their intention. Unless all three components are present, any decision cannot rightly be called autonomous (Beauchamp and Childress 2012).

Of these components, only the first is absolute: acts are either voluntary or not voluntary, and autonomous acts cannot be unintentional. On the other hand, the other components can be matters of degree – a person's freedom may be limited to some degree but not so much as to prevent an act or decision being autonomous, and the amount of information a person has may not be complete but nonetheless sufficient for the decision to be regarded as autonomous. The context of participation in human research, particularly biomedical research, illustrates the acceptance of such degrees. For example, people with the medical condition in question are likely to be favorably inclined to participate in research about that condition, although the information on which they base their decisions is unlikely to contain a full account of the scientific basis of the research.

## Competence or Capacity

An essential premise to assessing whether decisions merit recognition as autonomous decisions is that a decision-maker is competent or has the capacity to make that decision. The criteria for competence are similar to those for autonomy, but the two concepts are different. Autonomy means to be a self-ruling person, and competence means the ability to perform a task, for example, to make a decision.

For a person to be competent or to have capacity, the person needs to be able to take in and retain information about the decision, believe the information, weigh or use that information in reaching a decision, and express the decision.

Because competence is the ability to perform a task, legal and ethical doctrine has consistently held that competence is specific to the task to be performed or the decision to be made. The question is whether the person is or is not competent to make *the decision in question* – it is not whether the person is competent to make *any decisions*.

In medical practice, it is important to separate those patients whose decisions, legally, merit recognition from those patients whose decisions do not. The judgment that a patient is competent to make a decision is used to make this distinction. Routine presumptions assist; for example, adults are presumed to be competent unless there is reason to overturn that presumption; for example, an otherwise competent adult admitted to hospital with non-life-threatening injuries who is unconscious is not competent to decide about treatment at that time. On the other hand, children are presumed to lack competence to consent to treatment decisions unless there is reason to overturn that presumption. As children reach their mid-teens, we often refer to them as young people, in recognition of their increasing capacity and maturity. Assessment of a young person's stage of development and maturity can overturn the presumption against competence to make a specific decision; for example, a young person who has lived with a chronic condition since birth may be competent to make a choice about accepting treatment for the condition. If it is determined that a person is not competent to make a decision, another mechanism needs to be used for that decision to be made on that person's behalf.

## Competence and Autonomy

Competence means the ability to perform a given task, and autonomy means a self-governing person. Competence is a necessary but not a sufficient condition for an autonomous decision. Some, but not all, of the criteria for an autonomous decision may have been satisfied in deciding that the decision-maker is competent.

Even if someone has been found to be competent, he or she may be so affected by external influence or coercion or so lacking in relevant

information that the autonomous character of the decision is in doubt. In one case, a young woman who was, at all times, considered to be competent, gave consent to blood transfusion. However, during each of several visits from her mother, who objected to the procedure on religious grounds, the young woman withdrew her consent. Following each visit, the young woman renewed her consent. The question was whether consent or refusal was the autonomous decision of the daughter. In human research ethics, paying participants for their participation has often provoked debate whether such payments amount to “undue influence” and so compromise the autonomy of a competent participant's choice (Largent and Lynch 2017).

## Relational Autonomy

Most people reach their decisions in a familial or social context. These external influences might not affect someone's choice to the point that it is no longer autonomous. Consequently, some writers have offered an alternative model of autonomy, referred to as relational autonomy, which highlights the social context within which all individuals exist and acknowledges the emotional and embodied aspects of decision-makers (Mackenzie and Stoljar 2000).

## Respect for Autonomy

In professional ethics, and particularly medical ethics, discussion of autonomy most commonly emerges as an element in the principle of respect for autonomy. In medical ethics and human research ethics, this principle requires that an autonomous decision to accept or not to accept medical treatment or to participate or not participate in a research project should be respected and followed. In medical professional ethics, increasing recognition of the principle has marked a change in medical professional practice. Of two competing ethical principles – deciding what a doctor thought was best for patients' welfare (beneficence) and allowing patients to decide for

themselves (respect for autonomy) – the latter has come to take priority in treating competent patients.

## Consent

The recognition of individual choice demonstrates respect for autonomy by ensuring that persons with capacity who make autonomous decisions can express their will and expect it to be respected and acted upon.

Consent is the most common example of the acts or decisions that, when autonomous, merit respect. In the following components for an ethically sound consent, reliance on the elements of the concept of autonomy is apparent.

For an ethically and legally sound consent, the person giving that consent must be competent or have the relevant capacity to give that consent, have received sufficient information about the nature of what is to be consented to, comprehend that information, act voluntarily and freely, and give consent.

Although the principle of respect for autonomy is recognized in the requirement for consent, this application of the principle is not absolute. For example, medical professionals, including paramedics and ambulance officers as well as doctors, may legally administer treatment that is necessary to avert an imminent risk to life or health, without the patient's consent. In these emergency situations, an ethical obligation to act for the welfare of patients by preserving their life or health outweighs respect for autonomy.

## Informed Consent

Legal standards apply in many social contexts and impose requirements of substance and process for consent to be legally effective. The most well-known example of these is “informed consent.” This expression is a product of United States jurisprudence but has become commonly used in healthcare, research, and an ever-widening number of contexts (Faden and Beauchamp 1986).

Generally speaking, informed consent means a person's consent will be neither ethically nor

legally sound if that person considers she was not informed or that the disclosed information did not meet the required standard for disclosure. The concept is not accepted in every legal jurisdiction around the world. One problem with giving prominence to “informed consent” is to suggest that being informed is all that matters or the most important test for consent. This emphasis can lead to increasing the quantity of information disclosed, without regard to whether this helps the decision-maker. In human research ethics, this emphasis on disclosure often leads to using lengthy and complex information documents that are so long and so hard to understand that they fail to inform participants effectively (Ennis and Wykes 2016).

## Autonomy and Consent

Autonomy and consent are closely related. Consent by a person, of itself, marks a fundamental ethical (and legal) shift in that person's relationships. By giving consent, a person either permits conduct on the part of others that would otherwise be both unethical and illegal, for example, consenting to a doctor conducting a physical examination, or creates a new relationship with, or a new obligation to, another person or persons, for example, consenting to sell property to another person.

The importance of this fundamental effect of consent is reflected in the ethical requirement that, for consent to be respected, it needs to be autonomous – the decision of a self-governing person.

The tests for both autonomy and consent need to be satisfied for a consent to be ethically worthy of respect because when consent is an autonomous decision, there can be no doubt that it fully expresses the will and values of the decision-maker.

et al. 2018). These are just a minor selection of the leadership challenges in our times. Additionally, leaders should not underestimate that today’s followers are, on average, more educated and more independent in their thinking. They expect more input and get demoralized when they are summoned to follow their leaders mindlessly (see also chapter ► [“Toxic Leadership”](#) (Boddy, C.) in *Encyclopedia of Business and Professional Ethics*). Today’s leaders are therefore expected to have some psychological foundations that can assist them in critical areas such as humanism, moral awareness, and a communal approach (Marques 2015). To address issues that epitomize the spirit of our times, this chapter describes the awakened leader.

## Awakened Leadership: A Brief Overview

The notion of an “awakened” leader was inspired by an ancient story from the annals of Buddhism, a movement which some describe as a religion, others as a psychology, and yet others as a philosophy. Siddhartha Gautama, still a young man in India around 563 BCE, wanted to obtain a deeper understanding of life and, after trying different lifestyles, set himself under a tree to engage in insight meditation, also known as Vipassana. Thanks to his devoted meditation efforts, he ultimately gained enlightenment. As he made his way from one place to another, a passerby, who was fascinated by his radiance, asked him whether he was a god, a magician, a wizard, or anything else, upon which he simply stated, “I’m awake” (Kornfield 1999). Gautama subsequently changed his name to “Buddha,” which means, “the Awakened One” (Marques 2012) (see also chapter ► [“Buddhism and Business Ethics”](#) (Marques, J.) in *Encyclopedia of Business and Professional Ethics*).

Being an awakened leader entails being mindful and acquiring a deep understanding of what really matters. Awakened leaders remain authentic and true to their values at all times but also realize that they were not born with all the answers and that life is a continuous process of growth and change. Awakened leaders are very aware of their

## Awakened Leadership

## Synonyms

Mindful leadership; Moral values; Reflective leadership; Stakeholder awareness

## Introduction

Today’s leaders are expected to excel in different ways than their predecessors. Given our fast-paced times, they are continuously facing (a) shifts in societal values, leading to greater employee awareness and greater need for involvement (Higgs 2003); (b) changes in investor focus, from sheer shareholder advancement to increased stakeholder involvement (Jennings 2005); (c) needs for significant organizational change (Gordon and Pollack 2018; Sakhartov and Folta 2013); and (d) increased stress on employees, requiring steadfast human resource guidance to curtail excessive turnover (Raza

flaws as human beings, and the continuous need to assess their practices. They are very much shaped by occurrences in their lives. These occurrences differ from one individual to another, yet they consistently pave the road to wakefulness for all who seek it. Life's occurrences incite two important qualities: reflection and empathy (Marques 2010a). In the course of their path to maturity, awakened leaders may have faced issues that caused them to question their morals and reflect on the need to possibly reconsider them. Where needed, they did so, in the understanding that people, situations, and insights change and that regular reflection can be an eye-opening path toward greater empathy and understanding and, hence, more responsible decision-making (Marques 2010b).

When considered in light of the most dominant leadership theories, we find that awakened leadership is very situational oriented. In the situational leadership theory, leaders adapt their leadership style by assessing their employees, evaluate the critical factors in their workplace, and then choose the leadership style that best fits their goals. Awakened leadership, however, reaches beyond the distinction of the conventional tasks and relationship orientation, given the range of circumstances and stakeholders today's work environments deal with (Marques 2008). Awakened leaders are aware that, while the situational theory remains useful, there is more to leadership today than leaders, followers, and a work-based situation (Northouse 2018), so awakened leaders cannot merely base their decisions on those parameters only. They have to consider the factors mentioned in the introductory part of this chapter, such as shifts in societal values, changes in investor focus, needs for significant organizational change, increased stress on employees and the guidance this requires, as well as the urge of employees to acquire more ownership in decision-making. Most importantly, awakened leaders need to remain in touch with their conscience and identify reflective practices that enhance their mindfulness, so that they can maintain their inner balance. The strategies that these leaders may choose for mindfulness maintenance and enhancement may vary widely. Some leaders

will gravitate to meditation, while others may engage in prayer, yet others turn to trusted mentors, and some take to walking, yoga, or reading. The strategies onto themselves don't matter, as long as the leader feels that deep reflection occurs, and wakefulness is attained and maintained.

Awakened leaders share some of powerful characteristics, in addition to those already mentioned. They exert adaptability to different circumstances, drive, passion and commitment to achieve their goals, resilience, willpower to use failures as lessons for growth, clear vision of the bigger picture and the future, and a clear formulation of their values. Through their flaws, they also develop emotional intelligence, which enables them to compassionately relate to even the most downtrodden among their followers. Awakened leaders further share qualities such as courage, inspiration, and the ability to instigate positive change. In the following section, we will take a closer look at some specific skills, strategies, and qualities of awakened leaders.

## Elements of Awakened Leadership

The logical question that emerges when mentioning awakened leadership is: What exactly does this phenomenon comprise? The simplest answer to this question would be: Every possible leadership style, trait, and skill developed so far, as well as those still to be developed in the future, as long as these styles, traits, and skills meet the criteria of being constructive and applicable to all parties involved.

### Style Inclusions

Awakened leadership entails a comprehensive consideration of various leadership styles, which are at the disposal of every leader. Yet, the key factor is, that awakened leaders are conscientious in their consideration and application of any leadership style, whether autocratic, democratic, laissez-faire, transformational, participative, servant, authoritarian, situational, or other (Hussain and Hassan 2016). Given today's fast-changing performance climate, awakened leaders may display a fondness of servant leadership, as this style

**Awakened Leadership, Fig. 1** Awakened leadership

invites an approach of yielding and sharing responsibility. “Servant leadership can be defined as a multidimensional leadership theory that starts with a desire to serve, followed by an intent to lead and develop others, to ultimately achieve a higher purpose objective to the benefit of individuals, organizations, and societies” (Coetzer et al. 2017, p. 1). This behavior can also be related to the phenomenon “situational leadership,” which Northouse (2018) explains as “matching the leader’s style to the competence and commitment of subordinates.”

### Trait Inclusions

McCrae and Costa (1990) describe traits as “dimensions of individual differences in tendencies to show consistent patterns of thoughts, feelings, and actions” (p. 23). In a study among 195 participants, Nichols (2016) found that, as their leadership experience grows, leaders gain better insight in what it takes to be a good leader. With that, they also change the traits they desire to cultivate. Some of the dominant traits that emerged from Nichols’ study were helpfulness, kindness, support, agreeableness, cooperation,

fairness, self-confidence, self-assuredness, goal orientation, ambition, dominance, and assertiveness. In the case of awakened leaders, mindfulness is eminent. “Mindfulness likely supports positive affect because it consists of being focused on the present moment and [is] deeply engaged with present experiences” (Carleton et al. 2018, pp. 186–187). Other scholars, such as Secretan (2001), prefer the term “consciousness.” He asserts, “Consciousness is being awake to the mystical and ineffable aspects of being alive. The rational mind sees a world of scarcity and responds with fear. The conscious mind sees a world of abundance and responds with love” (p. 19). In Fig. 1, the concept of mindfulness/consciousness is captured as “conscious mind.”

### Balance

Along with the cautious selection of the appropriate style and the development of distinctive traits, awakened leadership still requires a responsible balance between task and relationship behavior, since these remain the drivers of performance toward a required goal. Leaders that focus strongly on task behavior are mainly concerned

with getting the job done and don't engage too much with the individuals involved and their perceptions about the job. In relationship behavior, the opposite happens: leaders are more concerned with the employees' well-being and less with the task at hand. Awakened leaders maintain a careful balance between these two extremes, in that they are concerned and supportive toward stakeholders (not merely employees), but also ensure that performance does not suffer.

### Emotional Intelligence

In the performance of awakened leadership, special emphasis should be laid on the aspect of emotional intelligence. EI has been defined as the ability to perceive emotions, access and generate emotions to assist thought, understand emotions and emotional meanings, and regulate emotions reflectively to promote both better emotion and thought (Mayer and Salovey 1997). Goleman (1998) defined emotional intelligence as "the ability to rein in emotional impulses, to read another's innermost feelings and to handle relationships and conflict smoothly" (p. 36). Pointing out the importance of developing and sustaining this quality, Goleman (1998) explained, "These emotional aptitudes can preserve relationships, protect one's health and improve success at work" (p. 36). Goleman divided emotional intelligence into the following five emotional competencies: (1) "The ability to identify and name one's emotional states and to understand the link between emotions, thought and action" (*"Emotional Intelligence,"* ¶ 11); (2) "The capacity to manage one's emotional states – to control emotions or to shift undesirable emotional states to more adequate ones" (*"Emotional Intelligence,"* ¶ 11); (3) "The ability to enter into emotional states (at will) associated with a drive to achieve and be successful" (*"Emotional Intelligence,"* ¶ 11); (4) "The capacity to read, be sensitive to, and influence other people's emotions" (*"Emotional Intelligence,"* ¶ 11); and (5) "The ability to enter and sustain satisfactory interpersonal relationships" (*"Emotional Intelligence,"* ¶ 11). More recently, Mayer et al. (2008) have described EI as "the ability to carry out accurate reasoning about emotions and the ability to use emotions and emotional knowledge to enhance thought" (p. 515). While there

is still no unified definition of EI, the above provided explanations underscore strongly enough that emotional intelligence is of high eminence in the performance of awakened leadership.

### Authenticity

The final attribute mentioned in this paper, although not the final quality involved in awakened leadership, is authenticity. George (2003) refers to authentic leadership as "driven by passion and purpose, not greed" (p. 6). It is George's opinion that "there are five essential dimensions to authentic leaders: purpose, values, heart, relationships, and self-discipline" (p. 6). George (2003) perceives authentic leadership as "the only way to build lasting value [by focusing] on the company's missions, customers, and employees" (p. 30). George further explains the creation and sustenance of lasting value by focusing on various aspects, which the author of this paper divided into two distinctive categories: the people and the organization. Pertaining to the people aspect, George mentions, "Connecting every day with your employees"; "Being out with your customers looking for great ideas for growth"; and "Getting results for all your stakeholders, not just the shareholder of the past five minutes" (p. 32). Pertaining to the well-being of the organization, George lists the following procedures, "Building your business by pursuing your mission with a passion"; "Being true to your core values in every decision"; and "Building an enduring organization of authentic leaders from top to bottom" (p. 32) (see also chapter ► *"Ethical Leadership"* (Páez Gabriunas, I.) in *Encyclopedia of Business and Professional Ethics*).

### Conclusion

Based on the styles and behaviors listed in this chapter, we can explain awakened leadership as an all-encompassing leadership approach, involving:

- The leader's awareness to incorporate the appropriate style given the followers and the situation

- The leader's capacity to sharpen the skills necessary for guiding him- or herself, his or her followers, and the organization in its entirety toward advancement
- The leader's ability to remain emotionally attuned to the self, the stakeholders, and the environment, thereby maintaining the highest level of authenticity possible

It is vital to underscore once again that the awakened leader, in considering the environment, remains focused on shifts in societal values, changes in investor focus, needs for significant organizational change, employees' well-being, employees' sense of ownership, and the leader's adherence to reflective practices to sustain mindful and conscious performance.

The model captured in Fig. 1 illustrates the aspects of awakened leadership, as outlined in this chapter.

## Axiology and Business Ethics

Rem Edwards

Robert S. Hartman Institute, Knoxville, TN, USA  
The University of Tennessee, Knoxville, TN, USA

## Synonyms

Extrinsic goods; Good businesses; Intrinsic goods; Systemic goods; Value judgments and feelings in business; Value rankings in business; Value standards in business

Introduction

Businesspersons understand that there are many kinds of goodness in addition to moral goodness – good workers, good managers, good products, good services, good training, and good profits. But what does “good” mean? The best available answer was formulated by Robert S. Hartman (1910–1973), who created formal axiology. Axiology is value theory. This includes ethics, aesthetics, logic, and every discipline having ideal norms or standards. Formal axiology focuses on formal patterns of value and evaluation and then applies them to the concrete particulars of *what* we value (values) and *how* we value (evaluations). The headings below identify its main features, all highly relevant to the business world.

Formal Definitions of “Good,” “Better,” “Best,” and “Ought”

Formal axiology says that anything is “good” if it fulfills the standards, norms, or ideals that we apply to it. To know whether anything is good, we must (1) have a set of ideal expectations or criteria consisting of an indefinite number of ideal “good-making” qualities or relations (properties), (2) examine or learn about what is being evaluated to determine its actual properties, (3) match its actual properties with those required by its ideal norms or criteria, and (4) judge it to be totally good if it has all the properties it is supposed to have or good by degrees (fair, average, poor, no good) if some but not all of them are present (Hartman 1967, pp. 101–109, 160–162; Edwards 2010, pp. 2–7). Anyone can become a better judge of value by understanding and applying these four steps.

Norms are built into all our notions about products, services, social and vocational roles, managers, workers, etc. How do we determine whether a business, its owner(s), its CEO, and its managers, workers, customers, products, or services are good? First, we must clearly grasp the ideal “good-making” qualities and relations expected of them, then learn the relevant facts about them, and then measure their actual

qualities and relations against our ideal expectations of them. If they succeed, or else fall short by degrees, this tells us which ones are best and less so and how to do, be, or choose better. Without realizing, managers who proceed in this way are applying formal axiology. For example, consumer publications (like *Consumer Reports*) apply this axiological formula very successfully. They give specific lists of ideal norms or good-making properties, examine and compare the properties of consumer products and services, and report actual degrees of expectation fulfillment.

“Good” is *complete* expectation fulfillment. *Degrees* of fulfillment are called “fair,” “average,” “poor,” “no good,” etc. Robert S. Hartman refers to Plato’s “Form of the Good” to discern that our values are the real keys to our personalities.

In abstract terms, the “Form of the Good” looks like this:

| Good-making properties      | Actual properties           |
|-----------------------------|-----------------------------|
| 1. _____                    | 1. _____                    |
| 2. _____                    | 2. _____                    |
| 3. _____                    | 3. _____                    |
| 4. _____                    | 4. _____                    |
| 5. _____                    | 5. _____                    |
| 6. Extend as far as needed. | 6. Extend as far as needed. |

People fail to reach agreement, or make value judgment mistakes, when they:

- A. Disagree about or misunderstand the ideal or expected good-making properties (on the left above)
- B. Fail to examine, learn about, or understand adequately the actual properties of the object being evaluated (on the right above)
- C. Mismatch the object’s actual properties with its ideal properties
- D. Fail to draw logical conclusions in their evaluation processes

This axiological formula can be applied to *anything*, moral or nonmoral and business or pleasure, about which value judgments are made. Value judgments are somewhat subjective in application because disagreements or errors may occur anywhere between A and D above

(Hartman 1967, pp. 110–111). Ideally, disagreements and errors can be discussed and resolved, but sometimes we just have to agree to disagree.

Value comparison is important in business and elsewhere. “Better” and “best” are positive comparative value concepts. If one good thing has more good-making properties than others in its class of comparison, it is *better* than those others. Employers or managers giving annual (or more frequent) job performance reviews to salespersons or other workers presumably compare them against the ideal standards or expectations in their job descriptions. Given only two workers, if one fulfills more relevant norms than the other, he or she is better qualified than the other. If one has more good-making properties than *all* others in the appropriate class of comparison, he or she is the *best* of the lot (Edwards 2010, pp. 20–22). Valuers may also need to give more weight to some properties than others using some hierarchy of value. When giving moral or professional directives to others, the word “ought” (or some synonym like “should”) is used. “You ought to do X” means “X is the best thing to do, so do it” (Edwards 2010, pp. 134–135).

### Three Kinds of Goodness

There are at least three kinds of positive *value* or goodness – systemic, extrinsic, and intrinsic. All kinds of goodness can be measured or compared rationally by degrees (Edwards 2010, pp. 27–39). Three kinds of *evaluation* correspond with each dimension of value:

1. *Systemic goods are desirable mental or conceptual value objects.* Primary examples are ideas; constructs; propositions; beliefs; laws; rules; mathematical, logical, and ritual forms; and formalities of every description. Examples of systemic business values are records, relevant laws and regulations, plans and goals, organizational structures, product or service designs, job descriptions and schedules, and the “bottom line” (numerical profits and losses). All businesses include systemic conceptual assumptions, beliefs, and ideal

expectations about production, supplies, products, services, employees, customers, owners, stockholders, etc. *Systemic evaluation* consists of assessing all such things (or anything at all) objectively or disinterestedly. Rational objective disinterestedness is not uninterestedness. It allows minimal feelings (desires, emotions, attitudes, etc.) that do not interfere with objective or fair-minded judgment and do not express irrational biases. All evaluation involves degrees of feeling, but evaluations are not mere feelings; they also involve rationally applying criteria and measurement, as in “the Form of the Good.”

Anything can also be evaluated as if it belongs to some other dimension of goodness. Ideals, beliefs, physical behaviors, products, processes, and people may be evaluated systematically (objectively) but also in other ways. We may objectively evaluate ideas and formalities (e.g., business rules or norms) without bias or prejudice or extrinsically for their usefulness or intrinsically through intense personal devotion to them. Persons, e.g., job applicants or employees, are evaluated systematically when measured objectively by the criteria contained in their job or task descriptions. They are valued extrinsically for their productiveness. They are valued intrinsically when recognized and treated as ends in themselves, when there is deep professional concern for their personal well-being, rights, job fulfillment, and overall satisfaction.

2. *Extrinsic goods are tangible means to ends beyond themselves.* They include both useful practical actions and physical objects and processes located in public space-time. Examples are beneficial human behaviors, natural resources, the physical necessities of life, and our natural physical environment. In businesses, extrinsic goods are such things as workplaces, raw materials, physical means of production, and tangible products and services. These are called “mere things” because they are inanimate, lack consciousness, and have no values of their own. *Extrinsic evaluation* approves of mere things for their usefulness

in fulfilling everyday practical or business interests.

Since anything can be evaluated as if it belongs to any other dimension of value, systemic goods like ideas, beliefs, and mathematical formulas as well as intrinsically valuable persons may be evaluated extrinsically, i.e., for their usefulness as means to ends beyond themselves. Businesses regularly do this. There is nothing morally wrong with evaluating and treating persons (employers, workers, customers, investors, etc.) as productive means to business ends – as long as they are also treated as ends in themselves. Morally questionable business practices exploit persons as *mere things*, mere means to ends beyond themselves (as in production or profits at all costs), while failing to recognize, respect, and treat them as real persons.

Perhaps the most moral businesses are the most profitable businesses – especially if governmental regulations level the playing field to prevent immoral competitors from having unfair advantages over businesses that treat everyone fairly, respectfully, and with dignity (Hartman 1991, pp. 193–199). Workers at every level are much more loyal, industrious, productive, and creative when they receive respect on the job; have worker rights; are treated fairly; have safe working conditions; enjoy and find personal fulfillment in their work; receive benefits like medical insurance, retirement plans, and profit-sharing; and are allowed to innovate and express their own unique capacities in getting their jobs done more creatively, efficiently, and economically. Similar considerations apply at every business level. Happy, repeat, and loyal customers are those who get fair deals and are treated with dignity and respect. Loyal employees are not much valued by many businesses today, but those that offer workplace conditions that foster company loyalty, identification, and commitment can save huge sums of money in hiring, job placement, training, or retraining.

3. *Intrinsic goods are ends in themselves, desirable for their own sakes.* Primary examples are the unique persons involved at every level of

business. *Intrinsic evaluation* consists in relating to value objects with intense respect, awareness, positive feelings, concern, and compassion. Since everything can be evaluated in any dimension of value, businesspersons may love or identify intensely with business ideas and plans, with physical objects, products, and processes or with managers, coworkers, and customers. Businesses are not primarily about loving, but all *good* businesses strive for a keen awareness of and respect for persons as ends in themselves and incorporate comprehensive intrinsic evaluations at every level. In business and elsewhere, people have the highest moral priority.

Not all philosophers agree that unique and unrepeatable persons are intrinsically good or valuable as ends in themselves. Some contend that repeatable abstractions like happiness, pleasure, beauty, creativity, truth, knowledge, laws, talents, virtues, adventures, desire and interest fulfillment, etc., are the only intrinsic goods, the only things valuable for their own sakes. After considerable reflection, plausibly, all such entities are “good for us” values rather than “good in, to, and for themselves” values. No such abstractions are or have selves or values of their own. None realize or care that they are valuable or mean anything to themselves or can even exist apart from us. They are valuable only because they are beneficial, meaningful, and self-fulfilling to unique conscious beings. They definitely are good for us, but we are the realities valuable as final ends. Only unique persons or conscious beings are of value in, to, and for themselves.

*Good businesses* recognize and actualize all three dimensions of value according to their degree of goodness. All businesses are selling something that excels, hopefully, in one or more of these dimensions. Poor businesses fail to the degree that they fail to actualize one or more of their systemic, extrinsic, or intrinsic value dimensions – in accord with the following hierarchy of values.

## The Hierarchy of Value

Businesspersons are very naïve if they think that only profits matter. All three realms of goodness are essential to every viable or profitable business but some dimensions of value matter more than others. In all of life, some good things are better than others. We must recognize, establish, and act upon priorities, but how? How can we tell which good things are better than other good things? All people, including business people, need a hierarchy of values, as well as good-making criteria or standards applicable to particulars.

All good things have what philosophers call “good-making” properties (qualities and relations). They are the components of all human norms. “Good” just means having some set of ideally expected good-making properties. This can be applied either *within* or *between* each dimension of value. Some particular entrepreneurial schemes, business resources, products, and services have more good-making properties than others, as do some employers, workers, customers, or job applicants. Many good things are better than others, and “better” just means having more good-making properties, properly ranked.

“Better” also applies *between* the three dimensions of value. Intrinsic goods have more good-making properties than extrinsic goods, which in turn have more good-making properties than systemic goods.

The three dimensions of goodness fall into a hierarchy of value (Hartman 1967 pp. 249–265; Edwards 2010, pp. 39–40). Since “better” means “having more good-making properties,” conscious individuals are better or more valuable than merely mindless things, and mere things are better or more valuable than conceptual symbols of good things or of people (Edwards 2010, pp. 40–41). Expressed abstractly, intrinsically valuable entities (people) have more value than extrinsically valuable, useful, inanimate, mindless, and physical objects and processes, and desirable extrinsically valuable entities are better than, have more good-making properties than, our mental signs or symbols for them. This is as true in the business world as anywhere else.

Some good things can be very good, yet others even better. Systemic values like business plans and know-how are merely mental signs that point toward even more desirable realities like actual business products and services. Mental symbols point or refer to realities beyond themselves. That is their primary purpose. No one should confuse the value of a good thing with the value of a mere symbol for it. An actual product is more valuable inherently than the mere idea of it. Which would you prefer: the mere idea of a new car or an actual new car, the mere idea of a new computer or an actual new computer, or real money in the bank or the mere thought of such? Both physical entities and human activities are more valuable extrinsically than our words for, thoughts about, or conceptual symbols for them. We can actually spend the coins in our pockets, but not our thoughts about them. Money in the bank is worth more than the money that exists merely in our minds, thoughts, or daydreams, even when numerically identical in face value. A good worker is more valuable than his or her job description. Real moral or practical actions are more valuable than merely thinking or dreaming about doing the right or useful thing.

We have words or symbols for people, for useful things, and for good ideas, but real people, products, and plans are much more valuable than, i.e., have more good-making properties than, our symbols for them. People are also more valuable than physical products, services, and activities. No cars, computers, or coins would have any value, or even any existence, without people. The buck of goodness stops and starts with people. People have vastly more good-making qualities and relations than mere thoughts or mere things. Which would you prefer: the mere idea of a good friend or an actual good friend, a real spouse and family or the mere thought of them, or a real employee or the mere idea of such? Qualitatively, people have thoughts and feelings and engage in intentional activities. They are animate, conscious, thoughtful, valuing, affective, caring, loving, and compassionate, but bank accounts, bottom lines, computer programs, cars, houses, smartphones, etc., are not. Real people, friends, loved ones, and coworkers are worth more than all

of our thoughts about them. In proportion to non-conscious extrinsic goods, they are priceless.

## Value Combinations, Calculations, and Profiles

Valuable objects belonging to each of the three dimensions of goodness may be combined with one another in positive or negative, helpful or hurtful, and value-increasing or value-decreasing ways. Value combinations may form organic wholes that are more valuable than the mere sum of the values of their components or parts. For example, we can use the insights and designs of entrepreneurs to create innovative and attractive products, and we can give useful or physically beautiful products to our coworkers, friends, and loved ones. People can unite intensely and intrinsically with others in marriage, family, friendship, and coworker identification. They can also collaborate extrinsically with other people in effective work and service relations. Good products can be sold for profit. Homes can be bought or built for people. Good ideas can help us become more thoughtful of and affectionate toward others or more useful to our employers, employees, and customers. The potential number of such value combinations is practically inexhaustible.

Things that are otherwise good may also be combined with other good things in hurtful or destructive ways, for example, when two good cars crash to make good junkers. Good ideas, useful things, and active people can be used to hurt or injure people, destroy property, degrade beliefs, and critique bad ideologies. Workers and machines can make production mistakes and errors.

Combinations of values and evaluations in or from diverse dimensions can be symbolized and assigned numerical values for calculation purposes, e.g., systemic (S), extrinsic (E), and intrinsic (I). When one value or evaluation enriches another, the form of their combination can be symbolized as  $X^X$ . When one diminishes the other, the form is  $X_X$ . Genuinely useful E products (E) can be symbolized as  $E^E$ . Genuinely flawed E products (E) can be represented as  $E_E$ . Loving (I) useful E products

(E), as acts of valuing useful E products intrinsically, can be represented as  $(E^E)^I$  – and so on – to practically endless levels of complexity. Symbols for value objects, evaluations, and combinations can be assigned numerical values, though exactly how to do this without conflating the three value dimensions is somewhat troublesome and controversial (Edwards 2010, pp. 175–176). Values and their combinations can be calculated.

Because positive and negative values and their combinations fall into a logical sequence of degrees of value, value combinations can be used to create value profiles like the Hartman Value Profile (Hartman 2006), now widely and successfully used by business consultants and employers to discover the strengths and weaknesses of job applicants, workers, managers, etc. To learn more, go to [www.hartmaninstitute.org](http://www.hartmaninstitute.org). The best way to understand businesspersons is to know what and how they value. Value-based profiles can successfully identify those applicants most likely to be loyal to, successful in, and fulfilled by their jobs – thus immensely reducing replacement or retraining costs. They can show that some current employees would be better suited for some other position or whether they are ready for promotion or if they need additional training. They can measure workplace morale and spirit. They can help immensely in the quest for goodness in businesses.

## Ayn Rand's Ethics

Eric Pezet  
 University of Paris Nanterre, Paris, France

### Synonyms

Ethical egoism; Objectivism; Objectivist ethics

### Introduction

Ayn Rand (1905–1982) is an American philosopher who emigrated from Russia to America in 1926. Her experience of communist Russia has nurtured an enduring hostility to any trace of collectivism in public life. She calls her philosophy objectivism, to emphasize that reality exists independently and can be accessed through reasoning. Rand's philosophy explicitly opposes Kant's approach to reality:

Kant's system secularized the mysticism of the preceding centuries and thereby gave it a new lease on life in the modern world. In the religion tradition 'necessary' truths were commonly held to be consequences of God's mode of thought. Kant substituted the 'innate structure of the human kind' for God, as the source and creator of 'necessary' truths (which thus became independent of the facts of reality). (Rand et al. 1979, p. 119)

Objectivism is an applied philosophy of self-accomplishment, with distinctive metaphysical, logical, and ethical assumptions.

### Objectivist Ontology and Epistemology: Living According to Reality

For Rand and follower objectivists, the world exists independently of consciousness, and rational reasoning is the proper way to act in relation

with the world. Consequently, to perceive the world and act upon it, people should be guided by reason rather than by religion, faith, or emotion – and this is true asceticism. Individual volition has to be exercised, as it is a necessary condition for living one's life fully:

Man's volition is an attribute of his consciousness (of his rational faculty) and consists in the choice to perceive existence or to evade it. To perceive existence, to discover the characteristics or properties (the identities) of the things that exist, means to discover and accept the metaphysically given. Only on the basis of this knowledge is man able to learn how the things given in nature can be rearranged to serve his needs (which is his method of survival). (Rand 1973/1984, p. 34)

Objectivism requires that, when emotion or imagination alters one's consciousness, one should make an effort of will and return to rational thinking. For Rand, the individual must be focused on their own self-interest. Altruism, whether in the form of religion or collectivism, leads people to sacrificing their self-achievement and thus causes unhappiness. Capitalism is the social doctrine that most prominently promotes self-accomplishment; in doing so, it grounds the dynamic of society in individual virtue. While selfishness is the central virtue of self-achievement, self-interest is the key landmark guiding individual life.

### Fiction as a Medium for the Embodiment of Objectivist Philosophy

Rand's philosophy cannot be detached from her fiction. She was not only a philosopher but also a fiction writer, influenced by French Romanticism à la Victor Hugo. For Rand romanticism expressed man's volition instead of representing a man influenced and even in some cases moved by his environment. Fiction was the medium by which Rand expressed and developed her philosophical ideas. Today, Rand's fiction readers can project themselves into objectivism by identifying, hermeneutically, with her characters. Howard Roark, a nonconformist architect (*The Fountainhead*) and John Galt (*Atlas Shrugged*) are heroes who resist institutions in order to preserve their freedom. They show courage and self-confidence by refusing to follow orientations they

do not approve of. As a businessman embodying and living a philosophy, Galt is especially interesting. This approach has been the key to making Rand's ideas accessible to a large public and to helping them easily identify with her characters. *The Fountainhead* (1943) and *Atlas Shrugged* (1957) were particularly popular in the USA in their time and have even been adapted for the cinema.

But Rand is also the leader and creator of a thought movement. The objectivist movement, as it is known in the history of ideas, combines objectivist philosophy with compelling fiction involving exceptional characters. Reflecting the inseparable entwinement between ideas and lived experiences, the history of this movement is also the history of passionate relations between Rand and people around her. When Nathaniel Branden, her long-term love interest, attempted to elaborate on her thought more independently, their relationship was irremediably damaged (in 1968), despite the fact that the Nathaniel Branden Institute (NBI, created in 1958) had made a substantial contribution to the dissemination of Rand's philosophy.

The objectivist movement has been structured around Rand's fictions and nonfictions but also, successively, around the following journals: *The Objectivist Newsletter* (1962–1965), *The Objectivist* (1966–1971), and *The Ayn Rand Letter* (1971–1976).

## Objectivism and the Defense of Capitalism as a Social Cause

Rand promoted a society where people are free to express themselves. For such a society to exist and flourish, it should rely on the smallest possible intervention from the state. According to Rand's social ideals, the individual is at the center of a society free from state oppression and collectivism. In this context, capitalism achieves justice by allowing each individual to realize their rational nature. Economics is the field where the individual can exercise their rational mind, but, in order to do this successfully, the individual has to be able to protect themselves from the

government's political and administrative power. To hold their ground when confronted public bureaucracy's natural tendencies to expand and take over social life, the individual must remain lucid and courageous. This is the necessary condition of their personal fulfilment. Rand's most popular novel, *Atlas Shrugged*, highlights the importance of resisting the state, as well as the individual courage that this resistance may require: "In capitalist society, all human relationships are voluntary. Men are free to cooperate or not, to deal with one another or not, as their own individual judgment, convictions, and interest dictate. They can deal with one another only in terms of and by means of reason, i.e. by means of discussion, persuasion, and contractual agreement, by voluntary choice to mutual benefit" (Rand 1966/1986, p. 308).

True to her pragmatic projects, Rand developed her ideas in an activist way. She intervened in the political debate to illustrate her philosophy. She was a thought leader recognized as mentor by some of the most powerful policy makers in the USA, including Alan Greenspan (former Chairman of the US Federal Reserve), John Mackey (co-founder of the innovative Whole Foods Market), and Jimmy Wales (co-founder of Wikipedia). While mostly known in the USA, Rand's ideas also won acolytes in like-minded political actors elsewhere, such as Malcolm Fraser, former Prime Minister of Australia. In healthcare policy, she publicly supported those medicine professionals that were hostile to the King-Anderson Bill promoting Kennedy's Medicare plan in 1962. She regarded this legislative proposal as an attempt to make doctors accept the collectivist-altruist principle of "self-immolation" (Rand 1963/1989, p. 285): "In pursuing his own career a doctor does have to do his best for the welfare of his patient. This relationship however cannot be reversed: one cannot sacrifice the doctor's interests, desires, and freedom to whatever patient (or their politicians) might deem to be their own welfare" (Rand 1963/1989, p. 288).

Although Rand's ideas have inspired more radical libertarians (such as Murray Rothbard), there are limits to her own radicalism. For example, in the debate about the place of the state

in society, within libertarian thought, she did consider the state necessary in order to maintain peace in society. These limits, however, did not prevent John Galt, the main character of *Atlas Shrugged*, from becoming the popular emblem of anarcho-liberalism.

Religious and spiritual ethics

## Introduction

Bahá'u'lláh (1817–1892), Prophet-Founder of the Bahá'í Faith, has left a rich legacy of sacred scripture, the equivalent of 100 volumes, each comprised of some 400 pages. No less significant is the example of the dynamic force of his life as an exile and prisoner. His teachings and life can be a daunting enterprise to anyone who wishes to extract the essence of Bahá'í ethics. *The Hidden Words*, a compilation of aphorisms dating from the earliest days of the mission of Bahá'u'lláh expresses the heart of his ethical teachings (Bahá'u'lláh 1985). That work is a “distillation of the spiritual guidance contained in the successive revelations of God” (Bahá'í International Community 1997).

The Bahá'í Revelation highlights, nay emphasizes, the coming world order based on the concept of the unity of humankind, a system based on justice, and the recognition of ourselves as having a common spiritual obligation and purpose to serve humanity. To understand Bahá'í ethics, one must place it in the context of recognizing and fostering our spiritual nobility and heritage, the need for unity, and accepting the idea that the current travails of the world can only end when the principles of justice prevail.

## Personal and Social Ethics

In the Bahá'í view, one cannot divorce personal ethics from the requirements of society and the world at large. The passage, repeated so often by Baha'u'llah Himself, that the ethics of the Baha'i Faith are evolving as conditions change: “Be anxiously concerned with the needs of the age ye live in, and center your deliberations on its exigencies and requirements” (Bahá'u'lláh 1952: 213). One's personal moral compass is also a social compass. Personal ethics is like a shell but requires a larger framework – one that embraces society. The personal shell is sturdy but it requires the embodiment of ethical principles that not only give life to that shell but also foster a deep and lasting connection to our spiritual reality and to a substantive change in how we relate to others, whether in our own family or in the wider world. There are spiritual gems that one can extract from the vast body

of the Writings of Bahá'u'lláh that constitute the core of Bahá'í ethics. Its power resides in the individual but only gains significance when acted in relation to others. A thought very similar to this is echoed in the work of French philosopher Emmanuel Levinas, who says that ethics is spawned from the specific relation between the self and other people (Levinas 1969: 198). In the end, he says that the power of ethics resides, not in the individual, but in the others whom the individual encounters. Through such encounters, the individual's world is endowed with ethics (since there exists another person, or other people, to whom the individual relates and is/are deserving of treatment as laid out below in the passage by Bahá'u'lláh). Of course, whether we say that the power resides in one qua individual, or in the other person qua other, the point stands that ethics gains significance in the world specifically in the many relationships that exist among people.

### Specific Instances of Bahá'í Ethics

The following passage provides a powerful example of what constitutes personal ethics that can only be realized in our relations to others:

Be generous in prosperity, and thankful in adversity. Be worthy of the trust of thy neighbor, and look upon him with a bright and friendly face. Be a treasure to the poor, an admonisher to the rich, an answerer to the cry of the needy, a preserver of the sanctity of thy pledge. Be fair in thy judgment, and guarded in thy speech. Be unjust to no man, and show all meekness to all men. Be as a lamp unto them that walk in darkness, a joy to the sorrowful, a sea for the thirsty, a haven for the distressed, an upholder and defender of the victim of oppression. Let integrity and uprightness distinguish all thine acts. Be a home for the stranger, a balm to the suffering, a tower of strength for the fugitive. Be eyes to the blind, and a guiding light unto the feet of the erring. Be an ornament to the countenance of truth, a crown to the brow of fidelity, a pillar of the temple of righteousness, a breath of life to the body of mankind, an ensign of the hosts of justice, a luminary above the horizon of virtue, a dew to the soil of the human heart, an ark on the ocean of knowledge, a sun in the heaven of bounty, a gem on the diadem of wisdom, a shining light in the firmament of thy generation, a fruit upon the tree of humility (Bahá'u'lláh. 1988: 93–94).

A closer exploration of this passage reveals several layers of meaning that bear on the

development of the person – but only insofar it pertains to one's relation to others.

The phrase, “Be generous in prosperity, and thankful in adversity” connotes a crossing of boundaries in human relationships. Human life, as we know, is not an indelible system of rewards and punishments. It encourages one to spread one's wealth but also allows those in adverse conditions to take spiritual stock of being in those conditions as a gift to inspire others and to afford the opportunity to others to be generous. Prosperity is sometimes bestowed on the least deserving of that wealth; adversities visit those who are more deserving of their lot in life.

The Bahá'í approach to being generous is such that there is a greater value attached to generosity when one is seeking neither “position nor prominence” (Abdu'l-Bahá 1976: 220–221).

The juxtaposition of generosity and adversity in the above quote also draws one's attention to the significance of adversity. The Bahá'í spiritual and ethical landscape offers a unique appreciation of adversity that takes a deep root, individually and socially. The Bahá'í teachings show that no one escapes adversity for “people are encircled with pain and calamities and are environed with hardships and trouble.” (Abdu'l-Bahá 1919: v. 3: 619).

The deeply religious underscore adversity “as a morning dew upon [God's] green pasture,” as Bahá'u'lláh avers, “and a wick for His lamp which lighteth earth and heaven (Bahá'u'lláh 1988: 17). The experience of adversity provides an opportunity to draw us closer to God and reassess our attachments to the contingent, material world. From the Bahá'í perspective, “adversity and trial, misfortune and derision” are “the cause of imperishable and deathless glory ...” (Abdu'l-Bahá 1919: v. 2: 264–265). Interestingly, Bahá'u'lláh, in His Most Holy Book, forbids lamenting about one's adversity (Bahá'u'lláh 1993: 161; Universal House of Justice 1973: 48). The importance of adversity extends to the wider, social, and collective scale, where “Adversity, prolonged, worldwide, afflictive, allied to chaos and universal destruction, must needs convulse the nations, stir the conscience of the world, disillusion the masses, precipitate a radical change

in the very conception of society, and coalesce ultimately the disjointed, the bleeding limbs of mankind into one body, single, organically united, and indivisible" (Research Department 1991: v.2: 187). The age-old promise of a united and peaceful world looms large in the mindset of the individual.

Regarding one's approach to the poor, the Bahá'í teachings state that while "the nobles and others in high rank are in easy circumstances, the poor also should be able to get their daily food and not be brought to the extremities of hunger" (Abdu'l-Bahá 1982: 29). Abdu'l-Bahá, the son of Bahá'u'lláh, in his sojourn in England once remarked that, "your poor are so very poor! This should not be. On the one hand you have wealth, and great luxury; on the other hand men and women are living in the extremities of hunger and want. This great contrast of life is one of the blots on the civilization of this enlightened age" (Abdu'l-Bahá 1982: 91). Part of the earlier-quoted phrase, "be a treasure to the poor, an admonisher to the rich" reverses the typical social norm about the poor. Bahá'í teachings on the rich and the poor turn contemporary approaches on their head, and challenge the ingrained attitude of many, including the wealthy, to admonish the poor, and it reverses the thought so that the wealthy are themselves to be admonished. "Knowledge alone," according to the Bahá'í teachings, "does not feed the starving man, nor can the poor be warmed by knowledge or words in the bitter winter; we must give the practical help of loving-kindness" (Abdu'l-Bahá 1982: 60). The ethical social extension of the Bahá'í approach requires the reshaping of the world's economic structure so that the extremes of wealth and poverty are eliminated.

No viable relationship can be based on lack of trust when we learn that one must be "worthy of the trust of thy neighbor," raising them to a new sanctified height when one reads that we must be "a preserver of the sanctity of thy pledge." Even in relation to those who are not trustworthy, Bahá'ís are encouraged to be truthful and honest in their dealings, with friendship as their goal. In this manner, they can "change this prison of treachery" into "a mansion of utmost trust" (Bahá'í World Centre 1982: 221). The touchstone of

trustworthiness is sincerity (Bahá'í World Centre 1982: 25).

In the Bahá'í view, the foundational principle of being fair is that the Creator is "kind and just to all. Why should we be unkind and unjust to each other?" (Abdu'l-Bahá 1976: 245). The notion of social justice pinpoints the individual's need to "be fair in thy judgment, and guarded in thy speech." The individual's behavior, namely to "be unjust to no man" is a mirror that gives strength to the larger social order. We are too familiar with society's patronizing attitudes in relating to others, but Bahá'u'lláh's phrase to "show all meekness to all men" counteracts those attitudes.

What is more, the teachings of Bahá'u'lláh prohibit gossip and "unseemly talk about others" and we learn that "stories repeated about others are seldom good. A silent tongue is the safest. Even good may be harmful, if spoken at the wrong time, or to the wrong person" (Abdu'l-Bahá 1982: 125).

When these nonpatronizing and nonjudgmental attitudes are spread throughout society, they bring a power into the world that regenerates the individual to being "a lamp unto them that walk in darkness, a joy to the sorrowful, a sea for the thirsty, a haven for the distressed, an upholder and defender of the victim of oppression."

Fully absent from these attitudes is the contemporary penchant to give full rein to one's "self esteem" as the starting point of one's ethical composure. The Bahá'í perspective distances itself from such a penchant. Instead, it extolls the spirit of service to others as key. Bahá'u'lláh urges us to "be a home for the stranger, a balm to the suffering, a tower of strength for the fugitive. Be eyes to the blind, and a guiding light unto the feet of the erring. Be an ornament to the countenance of truth, a crown to the brow of fidelity, a pillar of the temple of righteousness, a breath of life to the body of mankind, an ensign of the hosts of justice, a luminary above the horizon of virtue, a dew to the soil of the human heart, an ark on the ocean of knowledge, a sun in the heaven of bounty, a gem on the diadem of wisdom, a shining light in the firmament of thy generation."

These are evocative images that spur us to see our purpose to fully acclimatize our feelings and behavior to the needs of others. There is no clearer rejection of the hapless individualism visited upon our current generation. The arrogance associated with showing self-satisfying acts of attitudinal generosity is sharply contrasted with the spirit of one's actions that should be like "a fruit upon the tree of humility."

The idea of humility and meekness reverberates throughout this whole quoted passage. When one is called upon to make a judgment, he or she should "be fair in thy judgment and guarded in thy speech. Be unjust to no man and show all meekness to all men." One can now easily see how the calling forth of these attitudes can, and should be, echoed within the larger social structure, whether a committee or other social agencies. Justice, from the Bahá'í perspective, is the outcome humanity thirsts for.

### **Bahá'í Ethics Relation to Major Ethical Canons in Philosophy**

Philosophically, what is interesting to note is that the three major ethical canons in the history of philosophy (Aristotelian ethics, Kantian ethics, and Utilitarianism), though problematic in their own ways, each seem to pluck at the complete ethical system given to us by the Bahá'í Writings.

Aristotle believed that, to be ethical, we must lead a good, virtuous life. The Bahá'í Faith (as shown in the passage above) presents a number of foundational virtues that are to guide how we act and treat each other: trustworthiness, generosity, kindness, and so on. Embracing and enacting those virtues plays a key role in being an ethical person. Meanwhile, Kant's ethics were founded on what he called the "categorical imperative," which states that, when acting in a particular way, we must act purely out of duty, and not for some self-serving purpose. We do not act as a "treasure to the poor" so that we may receive thanks from them or others; rather, we do so because we are acting out of our love to humanity. Finally, utilitarianism, most famously laid out by

John Stuart Mill, and probably the most well-known by the general public, states that what is the ethical thing to do is that in which the ends justify the means. This ethical view is also the most controversial, since people have used it throughout history to justify any number of horrific, unethical acts (such as desiring the end of a pure, prolific race of people, and using that end to justify the means of eugenics, exile, or extermination). However, used in the right away, there is a kernel of truth in seeing that the end toward which we are working (a unified humanity) justifies acting in ways that are selfless, and thus contrary to how much of contemporary society behaves (in its own interest, or doing things that are only immediately self-satisfying). The betterment of society does not rest on seeing every means as an end in itself, but rather in seeing that there is a greater end, and that the way we act ought to serve that end.

### **No Legalistic Criteria of Observance**

Institutions formalize the individual's relationships to the rest of society. Typically, societies have enacted laws, a form of legalism that, according to the Bahá'í view, cannot be invoked to uphold a system of ethics. As Udo Schaefer et al. noted (2000: 270), "The ethic enshrined in the law is not one that is based purely on merit, with legalistic criteria of observance." Schaefer et al. (2000: 271) adds, "For what is required is not just literal compliance with the letter of the law. The law requires that the believer fulfill the demands made upon him out of the innermost devotion" out of love for the Manifestation of God.

Reliance on the legalism leads all to ignore the grey areas when considering ethical issues. To that end, the Universal House of Justice, the governing legislative body of the Bahá'í world community does not feel that the time has come for it [the Universal House of Justice] to provide detailed legislation on subjects such as abortion, homosexuality, and other moral issues.

[I]n most areas of human behaviour there are acts which are clearly contrary to the law of God and others which are clearly approved or permissible;

between these there is often a grey area where it is not immediately apparent what should be done. It has been a human tendency to wish to eliminate these grey areas so that every aspect of life is clearly prescribed. A result of this tendency has been the tremendous accretion of interpretation and subsidiary legislation which has smothered the spirit of certain of the older religions.

(Letter on behalf of the Universal House of Justice to an individual, 5 June 1988)

## Religious Truth Is Relative

What is more, as Bradford et al. (2001) affirm, the Bahá'í Faith's fundamental tenet "that certain religious truth itself is relative." The Bahá'í belief in "Progressive Revelation" (the belief that God sends his Manifestations to each people and each time as they are needed) means that thus in every Revelation differs in "many points of context and cultural relevance." However, "the Bahá'í Faith also teaches that ethical conduct can be universalized [while]... certain beliefs and actions are considered as wrong and immoral regardless of the historical context." The extensive body of Bahá'í sacred text allows Bahá'ís to sort out which ethical conduct belongs to either the former or latter category. Along with the authoritative interpretations of the Bahá'í Writings by 'Abdu'l-Bahá (1844–1921) and Shoghi Effendi (1897–1957) (respectively refereed to as "the Centre of the Covenant," and "the Guardian of the Bahá'í Faith), it is now up to the Universal House of Justice to provide clarification on matters of ethics (such as the one, above).

Bahá'ís believe that as humanity is coming of age, it will become self-evident what ethical conduct will emerge in that day and age. As Bradford et al. (2001) notes, "making ethical determinations is a requirement for and mark of maturity" of the human race. The assumption by individuals that they now must ascertain their own course of ethical action is an intrinsic part of being a Bahá'í, partly through consultation and seeking guidance from the Universal House of Justice in areas of ethical conduct which are left open by the law of God.

## Balanced Scorecard

Ogan Yigitbasioglu

School of Accountancy, QUT Business School,  
Brisbane, QLD, Australia

## Synonyms

Indicators; Measures; Performance dashboard

## Introduction

The balanced scorecard (Kaplan and Norton 1992) is a strategic management tool and a specific type of scorecard that views an organization from four perspectives or dimensions: (i) learning and growth, (ii) internal business processes, (iii) customers, and (iv) finance. Performance scorecards like the balanced scorecard have long existed in management (e.g., see *Tableau de Bord* conceived in the early part of the twentieth century in France) and provide a framework for developing performance metrics to collect and analyze data on an organization. The balanced scorecard has been widely adopted to support with the planning, running, and management of an organization. Managers use the balanced scorecard for three purposes: (i) decision-making and decision-rationalizing, (ii) coordination, and (iii) self-monitoring (Wiersma 2009). The balanced scorecard supports decision-making as managers can draw on the balanced scorecard data to explain and justify their decisions. The scorecard is also used as a communication tool because the selection of metrics informs employees what an organization values. Finally, the scorecard helps managers to monitor and evaluate individual or unit/firm performance.

## The Four Perspectives of the Balanced Scorecard

There are four perspectives in the original balanced scorecard. The learning and growth perspective focuses on measures that capture the skills and competencies of employees and the quality of the organizational climate (e.g., number of training hours per period, employee satisfaction ratings, number of cross-trained employees). Performance indicators that relate to internal business processes measure the efficiency and effectiveness of the workings of an organization in delivering the required products and services to customers (e.g., downtime hours per period, % of capacity utilization, % of on-time deliveries). The customer dimension captures the level of customer satisfaction and keeps track of customer interaction and loyalty (e.g., market share,

customer retention, number of new customers). Finally, the financial perspective focuses on more traditional measures based on monetary outcomes like revenues, profits, and return on investment. The four dimensions are linked together, although the causalities were initially not explicit in the original balanced scorecard when published (refer to strategy maps below): learning and growth leads to better business processes, which in turn improves customer value and eventually leads to better financial results.

It is important that measures in the balanced scorecard reflect the goals of an organization and are key to driving success. A balanced scorecard should include only a limited number of measures in each dimension, typically 4–6, to allow focus on what is important for an organization. In addition to being quantifiable, measures should include targets and acceptable ranges so that performance gaps can be readily identified and rectified through various initiatives.

Strategic initiatives in the balanced scorecard framework refer to action plans to meet strategic objectives. For example, problems associated with defects can be addressed through a total quality management program. Other issues may require new technologies such as advanced information systems or new policy and procedures. With this framework, the balanced scorecard offers managers a tool to plan and manage an organization, while ensuring that business activities are aligned with the vision and strategy of an organization.

## Leading and Lagging Indicators

The development of specifically balanced scorecard in the 1990s was a direct response to concerns in academia and practice that traditional financial measures lead to short-term focus (also known as managerial myopia, Merchant 1990) based on financial results, while compromising long-term interests (Hoque 2014). For example, a manager might reduce spending on employee training to boost short-term profits, although this would adversely affect long-term success, as employee skills are critical to organizations in the knowledge-based economy of today. As

three of the four dimensions are nonfinancial, the balanced scorecard promotes a more *balanced* view of an organization's short- and long-term objectives (Kaplan and Norton 1996). Kaplan and Norton (1996) refer to financial measures as lagging indicators because they measure the past and indicate whether long-term strategic goals have been achieved or not (e.g., increase in profit margin). In contrast, nonfinancial measures are leading indicators (e.g., % of defective products) and are highly firm specific and predictive in the sense that they can be influenced through various initiatives to change the future outcomes for lagging measures.

### Balanced Scorecard and Strategy Maps

The balanced scorecard approach is also associated with the concept of strategy maps. Kaplan and Norton (1996) introduced the concept of strategy maps to explicitly show the linkages between the four perspectives and how the measures link to strategy. Strategy maps include only the most important measures (key performance indicators) from the balanced scorecard and are organized in a cause and effect relationship according to the four perspectives of the scorecard.

### Balanced Scorecard for Ethics and Sustainability

The balanced scorecard can be adapted to include other perspectives or measures such as sustainability and ethics to address recent concerns in relation to environmental, social, and ethical issues. Figge et al. (2002) propose the addition of a nonmarket perspective to the balanced scorecard to keep track of measures that help preserve organizations' legitimacy and legality. For example, organizations with corporate social responsibility programs may include indicators that measure energy, water, and material efficiency, as well as the well-being of employees within the supply network, not just within the firm. This would include suppliers and their suppliers, as well as customers in downstream markets. Additional measures, particularly in relation to the

learning and growth perspective, can be introduced that would allow the monitoring of, for example, training hours of employees on ethics or policy and procedure development that enforces ethical and sustainable behavior.

### Performance Dashboards as Dynamic Scorecards

Recent advancements in information and communication technologies have given rise to more dynamic scorecards, also known as performance dashboards. Dashboards display the most important measures on a single screen to effectively monitor an organization (Yigitbasioglu and Velcu 2012). Scorecards allow users to explore data interactively through drill-down and roll-up functions and may afford scenario analysis. Also the use of visualization techniques in scorecard applications provides visual cues (e.g., through different color schemes and blinking) to users and decision-makers when indicators fall below predetermined targets. Even if performance dashboards may lack the strategic aspects of a balanced scorecard (e.g., alignment of measures with strategy, strategic initiatives), they serve similar purposes. In addition to monitoring performance, these relate to problem solving, rationalization of actions, and communication and consistency of measures (Pauwels et al. 2009; Velcu-Laitinen and Yigitbasioglu 2012).

## Behavioral Ethics and Euphemisms

Todd Haugh

Kelley School of Business/The Poynter Center for the Study of Ethics and American Institutions,  
Indiana University, Bloomington, IN, USA

### Synonyms

Mechanisms for mediating cognitive dissonance with respect to unethical behavior; Rationalization theory

### Definition

Behavioral ethics is the social scientific study of ethical and unethical behavior. The field occupies a space distinct from normative or legal approaches to ethics, which explore how individuals should behave, and instead aims to understand through empirical study how individuals actually do behave in ethical contexts and why.

Euphemisms are the substitution of words or phrases that evoke negative psychological effects. Euphemisms operate by making harmful conduct less so, thereby reducing personal responsibility for it. Euphemisms are often described as a process of moral disengagement, but a more accurate description from a behavioral ethics standpoint is that they are an aid to rationalization. Rationalizations, the psychological mechanism by which individuals internally verbalize justifications for future unethical or illegal acts so as to keep their positive self-perception intact while violating ethical norms, are a powerful facilitator of ethical wrongdoing, particularly in business. By making rationalizations easier to formulate and internalize, euphemisms help illuminate a central question of business ethics: why seemingly good people sometimes behave unethically.

### Euphemistic Behavior Fosters Rationalizations

The study of behavioral ethics is aimed at understanding how even well-intentioned people can sometimes behave unethically (Dana et al. 2012). Instead of asking the normative question of how individuals *should* act when facing ethical quandaries – the province of moral philosophers and traditional ethicists – behavioral ethics studies ask the empirical question of how individuals actually *do* act in moral contexts and what mental processes facilitate those acts. Behavioral ethics, then, can best be described as the inquiry into the “systematic and predictable ways in which individuals make ethical decisions and judge the ethical decisions of others” (Bazerman and Gino 2012).

This definition hints at the core finding of the roughly two decades of studies conducted under the behavioral ethics umbrella – that heuristics and biases, psychological tendencies, and social and organizational pressures can make it more likely that good people will do bad things (Prentice 2015). In simple terms, behavioral ethics research tells us that although most people are moral individuals intent on doing right, none of us are as ethical as we think we are.

One of the primary psychological processes that allow for unethical acts to go forward, even by those intent on acting ethically, is rationalizing. Rationalization theory posits that an individual contemplating violating a position of trust – the essence of almost all unethical and illegal business conduct – must verbalize his actions in “language that lets him look on trust violation as something other than trust violation” (Cressey 1965). Put another way, the individual uses words and phrases during an internal dialogue that makes the behavior acceptable in his mind, thus keeping his perception of himself as an honest citizen intact. Importantly, research suggests that rationalizations are created before unethical or illegal acts take place. “The rationalization is [the offender’s] motivation” – it justifies his behavior to others, but it also makes the behavior intelligible, and therefore actionable, to himself (Cressey 1973). Thus, rationalizations permit behavior to proceed that would otherwise be psychologically unavailable or unacceptable to an offender.<sup>1</sup>

Euphemisms and euphemistic labeling facilitate the rationalization process by making the words and phrases offenders use during their internal dialogue more psychologically palatable. The formal definition of euphemism is “a lexical

substitution strategy for representationally displacing topics that evoke negative affect, its aim being to reduce the communicative discomfort associated with a distasteful topic” (Munoz 2011). But a more straightforward conceptualization is to think of euphemisms simply as the substitution of one word for another as a way to avoid the negative emotions evoked by the first (la Cour and Kromann 2011). Euphemisms, then, are the “disguised” stories we tell ourselves that allow for emotional, and oftentimes ethical, neutrality (Tenbrunsel and Messick 2004; Jackall 1988). Some researchers suggest that euphemisms only succeed if they do not call undue attention to themselves – an effective euphemism acts as a type of linguistic and psychological camouflage (Munoz 2011, at 138 [citing McGlone et al. 2006]). Although euphemisms are not inherently negative, and in fact can serve to open dialogue by allowing speakers to overcome inhibitions of talking about unpleasant topics, their ability to disguise moral transgressions and foster rationalizations is problematic (Fyke and Lucas 2014). As such, euphemisms have been characterized as an “injurious weapon” (Bandura 1999).

When it comes to business, there is no shortage of euphemistic language. This may take the form of abstractions, foreign language substitutes, metaphors, circumlocutions, mispronunciations, and acronyms (Munoz 2011, at 138; la Cour and Kromann 2011, at 269). For example, the term “dismissal,” which is a common and oftentimes necessary employment action, has garnered dozens of euphemisms: layoff, let go, downsize, rightsize, outsource, career change, career transition, career alternative, early retirement opportunity, duties relief, payroll adjustment, headcount adjustment, headcount realignment, headcount reduction, personnel realignment, personnel surplus reduction, resource action, resource reallocation, contract extension decline, workforce rationalization, workforce imbalance correction, staff release, termination, and RIF (reduction in force) (Munoz 2011, at 151). Some might argue that “dismissal” is a euphemism itself, a softening of the term “firing.”

While these verbal substitutions might only be used to politely discuss a difficult topic, they may

<sup>1</sup> *Id.* at 153. See also, Anand et al. (2005) (discussing how employees perpetrating corrupt acts engage in “rationalizing tactics” and identifying six tactics); Heath (2008) (suggesting that bureaucratic organizations “might constitute peculiarly criminogenic environments” and discussing how that fosters rationalizations); Prentice (2015), at 69–74 (identifying rationalizations and discussing how organizations can help thwart them); Haugh (2015) (analyzing rationalizations’ role in white collar crime and how it is fostered by overcriminalization).

serve as avenues for managers to morally disengage from a task with significant ethical implications (Moore et al. 2012). If this occurs, ethical decision-making is impacted – by avoiding the inherent complexity of ethical dilemmas, we succumb to “mindlessness and consequently decrease the quality and ethicality” of our decisions (Fyke and Lucas 2014, at [10]). As sanitized language is used repeatedly, the ethically controversial act may appear increasingly benign. This has immediate and prospective consequences by encouraging mindless processing of ethical decisions, which may then be committed to personal and institutional memory, setting precedent for future unethical decisions. Moreover, euphemisms can have a backward effect, helping to provide a psychological shield for prior bad conduct – the negative emotions associated with the act are reduced through the euphemistic frame.

This signifies the true danger of euphemisms, particularly as to unethical and illegal acts in the corporate world, because they allow business people to more easily minimize the disconnect between their unethical behavior and their positive self-perception. Indeed, because rationalizations are not “invented . . . on the spur of the moment” by the offender, but are rather taken over from popular ideologies swirling around in society, euphemisms fuel rationalizations.<sup>2</sup> Euphemisms, as a mechanism that psychologically relabels unethical acts, help create “group definitions” in which bad behavior, “even crime, is in a sense *appropriate*.”<sup>3</sup>

This dynamic can be seen in some of the earliest studies on white-collar crime and rationalizations. Interviews with convicted embezzlers demonstrated that they tended to adopt commonplace sayings suggesting wrongdoing is acceptable in certain situations, such as “[a]ll people steal when they get in a tight spot.”<sup>4</sup> Once these ideologies were adopted and internalized, they were then transformed into powerful,

context-specific rationalizations. The paradigmatic example is the embezzler who rationalized by stating, “I’m only going to use the money temporarily, so I am borrowing, not stealing.”<sup>5</sup> The term “borrowing” is a euphemism for “stealing.” By employing this verbal switch, the embezzler is more easily able to rationalize the unethical and illegal behavior, keeping his self-perception intact while violating trust and social norms.

<sup>3</sup>See Prentice (2015), p. 36

contemplating violating a position of trust – the essence of almost all unethical and illegal business conduct – must verbalize his actions in “language that lets him look on trust violation as something other than trust violation.”<sup>4</sup> Put another way, the individual uses words and phrases during an internal dialogue that makes the behavior acceptable in his mind, thus keeping his perception of himself as an honest citizen intact. Importantly, research suggests that rationalizations are created before unethical or illegal acts take place. “The rationalization is [the offender’s] motivation” – it justifies his behavior to others, but it also makes the behavior intelligible, and therefore actionable, to himself.<sup>5</sup> Thus, rationalizations permit behavior to proceed that would otherwise be psychologically unavailable or unacceptable to an offender.<sup>6</sup>

Euphemisms and euphemistic labeling facilitate the rationalization process by making the words and phrases offenders use during their internal dialogue more psychologically palatable. The formal definition of euphemism is “a lexical substitution strategy for representationally displacing topics that evoke negative affect, its aim being to reduce the communicative discomfort associated with a distasteful topic.”<sup>7</sup> But a more straightforward conceptualization is to think of euphemisms simply as the substitution of one word for another as a way to avoid the negative emotions evoked by the first.<sup>8</sup> Euphemisms, then, are the “disguised” stories we tell

ourselves that allow for emotional, and oftentimes ethical, neutrality.<sup>9</sup> Some researchers suggest that euphemisms only succeed if they do not call undue attention to themselves – an effective euphemism acts as a type of linguistic and psychological camouflage.<sup>10</sup> Although euphemisms are not inherently negative, and in fact can serve to open dialogue by allowing speakers to overcome inhibitions of talking about unpleasant topics, their ability to disguise moral transgressions and foster rationalizations is problematic.<sup>11</sup> As such, euphemisms have been characterized as an “injurious weapon.”<sup>12</sup>

When it comes to business, there is no shortage of euphemistic language. This may take the form of abstractions, foreign language substitutes, metaphors, circumlocutions, mispronunciations, and acronyms.<sup>13</sup> For example, the term “dismissal,” which is a common and oftentimes necessary employment action, has garnered dozens of euphemisms: layoff, let go, downsize, rightsize, outsource, career change, career transition, career alternative, early retirement opportunity, duties relief, payroll adjustment, headcount adjustment, headcount realignment, headcount reduction, personnel realignment, personnel surplus reduction, resource action, resource reallocation, contract extension decline, workforce rationalization, workforce imbalance correction, staff release, termination, and RIF (reduction in force).<sup>14</sup> Some might argue that “dismissal” is a euphemism itself, a softening of the term “firing.”

While these verbal substitutions might only be used to politely discuss a difficult topic, they may serve as avenues for managers to morally disengage from a task with significant ethical implications.<sup>15</sup> If this occurs, ethical decision-making is

<sup>15</sup>Moore et al. (2012), pp. 1, 5

impacted – by avoiding the inherent complexity of ethical dilemmas, we succumb to “mindlessness and consequently decrease the quality and ethicality” of our decisions.<sup>16</sup> As sanitized language is used repeatedly, the ethically controversial act may appear increasingly benign. This has immediate and prospective consequences by encouraging mindless processing of ethical decisions, which may then be committed to personal and institutional memory, setting precedent for future unethical decisions.<sup>17</sup> Moreover, euphemisms can have a backward effect, helping to provide a psychological shield for prior bad conduct – the negative emotions associated with the act are reduced through the euphemistic frame.

This signifies the true danger of euphemisms, particularly as to unethical and illegal acts in the corporate world, because they allow business people to more easily minimize the disconnect between their unethical behavior and their positive self-perception. Indeed, because rationalizations are not “invented . . . on the spur of the moment” by the offender, but are rather taken over from popular ideologies swirling around in society, euphemisms fuel rationalizations.<sup>18</sup> Euphemisms, as a mechanism that psychologically re-labels unethical acts, help create “group definitions” in which bad behavior, “even crime, is in a sense *appropriate*.”<sup>19</sup>

This dynamic can be seen in some of the earliest studies on white collar crime and rationalizations. Interviews with convicted embezzlers demonstrated that they tended to adopt commonplace sayings suggesting wrongdoing is acceptable in certain situations, such as “[a]ll people steal when they get in a tight spot.”<sup>20</sup> Once these ideologies were adopted and internalized, they were then transformed into powerful, context-specific rationalizations. The paradigmatic example is the embezzler who rationalized by stating, “I’m only going to use the

money temporarily, so I am borrowing, not stealing.”<sup>21</sup> The term “borrowing” is a euphemism for “stealing.” By employing this verbal switch, the embezzler is more easily able to rationalize the unethical and illegal behavior, keeping his self-perception intact while violating trust and social norms.

### Synonyms

Impact on ethical decision making; Mechanisms for mediating cognitive dissonance with respect to unethical behavior; Rationalization theory.

### Definition

Behavioral ethics is the social scientific study of ethical and unethical behavior. Distinct from normative or legal approaches to ethics that explore how individuals should behave, behavioral ethics aims to understand, through empirical study, how we actually do behave in ethical contexts and why. Rationalizations, the process by which individuals internally verbalize justifications for future unethical or illegal acts so as to keep their positive self-perception intact while violating ethical norms, are a powerful psychological mechanism that facilitates wrongdoing. As behavioral insights into ethical decision-making increase, so too does the importance of rationalizations in explaining ethical lapses.

## Rationalizations Foster Unethical Behavior

The study of behavioral ethics is aimed at understanding how even well intentioned people can sometimes behave unethically (Dana et al. 2012). Instead of asking the normative question of how individuals *should* act when facing ethical quandaries – the province of moral philosophers and traditional ethicists – behavioral ethics studies ask the empirical question of how individuals actually *do* act in moral contexts and what mental processes facilitate that action. As such, behavioral ethics can best be described as the study of the “systematic and predictable ways in which individuals make ethical decisions and judge the ethical decisions of others” (Brazerman and Gino 2012).

This definition hints at the central finding of the many studies conducted under the behavioral ethics umbrella – that heuristics and biases, psychological tendencies, social and organizational pressures, and even seemingly irrelevant situational factors can make it more likely that good people will do bad things (see Prentice 2015). In simple terms, behavioral ethics research tells us that while most people are moral individuals intent on doing right, we are not as ethical as we think we are.

One of the primary psychological processes that allows for unethical acts to go forward, even by those intent on acting ethically, is rationalizing. Although rationalizations have been studied for decades by criminologists, their role in ethical decision-making has not been a sustained research focus. That appears to be changing, particularly as to business ethics, with the increased focus on behavioral ethics research, which draws on psychological insights to explain unethical behavior.<sup>1</sup>

<sup>1</sup> See Anand et al. (2005) (discussing how employees perpetrating corrupt acts engage in “rationalizing tactics” and identifying six tactics); Heath (2008) (suggesting that bureaucratic organizations “might constitute peculiarly criminogenic environments” and discussing how that fosters rationalizations); Prentice (2015), pp. 69–74 (identifying rationalizations and discussing how organizations can help thwart them); Haugh (2015) (analyzing rationalizations’ role in white collar crime and how it is fostered by overcriminalization).

### Rationalization Theory

Understanding rationalizations begins with understanding the work of criminologist Donald Cressey. Cressey used a study of embezzlers to develop a social psychological theory regarding the causes of “respectable” crime (Cressey 1965, 1973). Cressey determined that three key elements are necessary for violations of a financial trust – the essence of all white collar and corporate crime – to occur. First, Cressey theorized that an individual must possess a nonshareable financial problem, that is, a financial problem the individual feels cannot be solved by revealing it to others. Second, the individual must believe that the financial problem can be solved in secret by violating a trust. Third, the individual must verbalize the relationship between the nonshareable financial problem and the illegal or unethical solution in “language that lets him look on trust violation as something other than trust violation” (Cressey 1973, pp. 14–15). Put another way, the individual uses words and phrases during an internal dialogue that makes the behavior acceptable in his mind, thus keeping his perception of himself as an honest citizen intact.

Cressey called verbalizations “the crux of the problem” (Cressey 1973, pp. 14–15). He believed that the words a potential offender uses during his conversations with himself were “actually the most important elements in the process which gets him into trouble, or keeps him out of trouble” (Cressey 1973, pp. 14–15). Cressey did not view verbalizations as after-the-fact excuses that offenders used to relieve their culpability upon being caught. Instead, he found that verbalizations were vocabularies of motive, words and phrases that existed as group definitions labeling deviant behavior as appropriate. Importantly, this meant that an offender’s rationalizations were created *before* wrongdoing occurred. As Cressey put it, “[t]he rationalization is his motivation” – it not only justifies his behavior to others but it makes the behavior intelligible, and therefore actionable, to himself (Cressey 1973, pp. 94–95). Thus, verbalizations permit behavior to proceed that would otherwise be psychologically unavailable or unacceptable to an offender (Cressey 1973, p. 153).

Shortly after Cressey published his theories, two other criminologists, Gresham Sykes and David Matza, advanced a sophisticated theory of how juvenile delinquents rationalize their behavior. Like Cressey, Sykes and Matza found that while rationalizations might occur following deviant behavior, they also preceded behavior and made it possible (Sykes and Matza 1957). By rationalizing their conduct *ex ante*, offenders were able to limit the “[d]isapproval flowing from internalized norms and conforming others in the social environment” (Cressey 1973, p. 666). Sykes and Matza called these rationalizations “techniques of neutralization,” and the two believed they explained the episodic nature of delinquent behavior more completely than competing theories (Cressey 1973, p. 667). Neutralization techniques – what are commonly called rationalizations – explained how offenders could “remain[] committed to [society’s] dominant normative system,” yet qualify that system’s imperatives in a way to make periodic violations “‘acceptable’ if not ‘right’” (Cressey 1973, p. 667). Rationalization theory and its core idea – that the psychological mechanisms offenders use to rationalize their behavior are a critical component in the commission of crime – has greatly influenced the study of both white collar crime and business ethics.<sup>2</sup>

It is important to note that although rationalization theory has applicability to all criminal behavior, it has particular force in explaining white collar and corporate crime. As an initial matter, rationalization theory has its roots in Cressey’s study of “respectable” crime (Cressey 1973, pp. 13, 16). Indeed, Sykes and Matza recognized that rationalizations are used not only by juveniles but might also be used by adults engaged in general forms of deviance, including those committing crimes in the workplace. More fundamentally, rationalization theory is especially applicable in describing the causes of corporate

<sup>2</sup> See Maruna and Copes (2005) (stating that the “influence of this creative insight has been unquestionable”); see also Anand et al. (2005), p. 39 (applying rationalization theory to business law and ethics in a widely cited work); Heath (2008), pp. 610–611 (same).

crime because “almost by definition white-collar offenders are more strongly committed to the central normative structure” (Benson 1985). They are older, more educated, better employed, and have more assets than other offenders. These factors suggest that white-collar offenders are able to conform to normative roles and have self-interest in doing so – they have a “greater ‘stake’ in conformity” than other categories of offenders (Kieffer and Sloan 2009). Therefore, white collar offenders must rationalize their behavior; without doing so, they would be unable to “bring [their] actions into correspondence with the class of actions that is implicitly acceptable in . . . society” (Benson 1985, p. 588).

### Common Rationalizations

To put rationalization theory in better context, below are eight of the most prominent rationalizations used by white collar and corporate offenders. These rationalizations help explain how those facing decisions with an ethical component, particularly related to business, commit unethical or illegal acts.<sup>3</sup>

*Denial of Responsibility.* Called the “master account,” the denial of responsibility rationalization occurs when the future offender defines her conduct in a way that relieves her of responsibility, thereby mitigating “both social disapproval and a personal sense of failure” (Maruna and Copes 2005, pp. 231–232). Generally, offenders deny responsibility by claiming their behavior is accidental or due to forces outside their control. White collar offenders deny responsibility by pleading ignorance, suggesting they were acting under orders or contending larger economic conditions caused them to act illegally. The complexity of laws regulating white collar crimes and the hierarchical structure of companies offer offenders numerous ways to deny their responsibility.

*Denial of Injury.* This rationalization focuses on the injury or harm caused by the illegal or unethical act. White collar offenders may rationalize their behavior by asserting that no one will really be harmed. If an act’s wrongfulness is partly a function of the harm it causes, an offender can excuse or mollify her behavior if no clear harm exists. The classic use of this technique in white collar crime is an embezzler describing her actions as “borrowing” the money – by the offender’s estimation, no one will be hurt because the money will be paid back (Cressey 1973, p. 15; Kieffer and Sloan 2009). Offenders may also employ this rationalization when the victim is insured or the harm is to the public or market as a whole, such as in insider trading or antitrust cases.

*Denial of the Victim.* Even if an offender accepts responsibility for her conduct and acknowledges that it is harmful, she may insist that the injury was not wrong by denying the victim in order to neutralize the “moral indignation of self and others” (Sykes and Matza 1957, p. 668). Denying the victim takes two forms. One is when the offender argues that the victim’s actions were inappropriate and therefore he deserved the harm. The second is when the victim is “absent, unknown, or abstract,” which is often the case with property and economic crimes (Maruna and Copes 2005, p. 233). In this instance, the offender may be able to minimize her internal culpability because there are no visible victims “stimulat[ing] the offender’s conscience” (Maruna and Copes 2005, p. 233). White collar offenders may use this rationalization in frauds against the government, such as false claims or tax evasion cases, and other crimes in which the true victim is abstract.

*Condemning the Condemners.* White collar offenders may also rationalize their behavior by shifting attention away from their conduct on to the motives of other persons or groups. By doing so, the offender “has changed the subject of the conversation”; by attacking others, “the wrongfulness of [her] own behavior is more easily repressed” (Sykes and Matza 1957, p. 668). This rationalization takes many forms in white collar cases: the offender calls her critics hypocrites,

<sup>3</sup> Sykes and Matza originally identified five rationalization techniques. See Sykes and Matza (1957), pp. 667–670. Researchers have currently identified between 10 and 15 additional rationalization techniques. See Maruna and Copes (2005), p. 234.

argues they are compelled by personal spite, or asserts they are motivated by political gain. The claim of selective enforcement or prosecution is particularly prominent in this rationalization. In addition, white collar offenders may point to a biased regulatory system or an anticapitalist government to rationalize their acts.

*Appeal to Higher Loyalties.* The appeal to higher loyalties rationalization occurs when an individual sacrifices the normative demands of society for that of a smaller group to which the offender belongs. The offender does not necessarily reject the norms she is violating; rather, she sees other norms that are aligned with her group as more compelling. In the white collar context, the group could be familial, professional, or organizational. Offenders rationalizing their behavior as necessary to provide for their families, protect a boss or employee, shore up a failing business, or maximize shareholder value are employing this technique.

*Metaphor of the Ledger.* White collar offenders may accept responsibility for their conduct and acknowledge the harm it caused, yet still rationalize their behavior by comparing it to their previous good behaviors. By creating a “behavior balance sheet,” the offender sees her current negative actions as outweighed by a lifetime of good deeds, both personal and professional, which minimizes moral guilt (Salinger 2013).

*Claim of Entitlement.* Under the claim of entitlement rationalization, offenders justify their conduct on the grounds that they deserve the fruits of their illegal behavior. This rationalization is particularly common in employee theft and embezzlement cases, but is also seen in public corruption cases.

*Claim of Relative Acceptability/Normality.* The final rationalization entails an offender justifying her conduct by comparing it to the conduct of others. If “others are worse” or “everybody else is doing it,” the offender, although acknowledging her conduct, is able to minimize the attached moral stigma and view her behavior as aligned with acceptable norms (Coleman 2002). In white collar cases, this rationalization is often used by tax violators and in real estate, accounting, and insider trading frauds. It is particularly prevalent

when the organizational culture is strong and insulated.

The above highlights the promise and challenge of using rationalization theory to understand unethical behavior. While considerable evidence supports that rationalizations are part of decision-making, it is difficult to specify exactly which rationalizations are being used and why.<sup>4</sup> As one researcher put it, rationalizations are not “one size fits all” and trying to suss out the particulars of human thinking is “undoubtedly complex” (Haugh 2017). Moreover, it is unclear why certain individuals seem to be more inclined to rationalize than others. Finally, there are many questions as to how the behavioral insights related to rationalizations might be harnessed to reduce unethical and illegal acts, on both an individual and organizational level. Hopefully future study of rationalizations – “[o]ne of the major reasons why people make poor ethical choices and thereafter engage in unethical actions” – will shed light on these important questions (Prentice 2015, p. 69; see also Brazerman and Gino 2012).

## Beneficence

Colin J.H. Thomson  
Graduate Medicine, Faculty of Science, Medicine and Health, University of Wollongong,  
Wollongong, NSW, Australia

## Synonyms

Benefaction; Charity; Philanthropy

## Introduction

Beneficence can be defined as the doing of good; active goodness or kindness; charity.

In early accounts, emphasis is given to the voluntary and free generosity that is supererogatory – actions for which there are no obligations but which are above and beyond existing duties or responsibilities. It is this charitable character that is emphasized when recognizing that a failure to act beneficently attracts no punishment, whereas acting beneficently will commonly attract approval or reward.

In moral philosophy, the justification for beneficence can draw on consequentialism or deontology. Where beneficent conduct generates good or value for many people, these consequences may be used as the justifying philosophical argument. Alternatively, in a relationship where there is an existing ethical obligation, beneficent conduct provides value or good in a way that exceeds the scope and extent of a relevant duty – and for this reason is referred to as supererogatory. The beneficence is defined by the scope of that duty.

## The Empirical Contexts of Beneficence

These two characteristic moral justifications for beneficence reflect two of the three contexts in which it has been discussed and applied. These are public health and clinical health practice.

### Public Health

Beneficence is one of the moral compulsions driving public health – not only that a public health system should prevent disease and remove causes of disease, but it should also promote good health. Beneficence in this context goes beyond merely protecting communities from harm in the form of illness or disease and moves towards promoting their good, improved, and continued health in the widest sense. As the World Health Organization defined the term in its 1948 Constitution, beneficence entails working for “a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity” (WHO).

### Clinical Health Practice

In clinical health practice, beneficence is listed among the widely recognized set of principles of

medical ethics, together with autonomy, non-maleficence, and justice. The deliberate inclusion of beneficence as well as nonmaleficence serves to emphasize a more extensive role for beneficence than merely avoiding harm. Some commentators have distinguished positive beneficence – preventing harm, – removing harm, and doing or promoting of good from both nonmaleficence and a third concept, utility. Stated simply, the utility of an act or a rule is measured by the extent to which it promotes the greatest good for the greatest number of affected persons. Utility recognizes that both positive and negative consequences may flow from a single action. In order to assess utility, all consequences need to be accounted for so that the aggregate of negative impacts can be compared with and weighed against the aggregate of positive impacts. Assessing the morality or acceptability of an act or a rule by this measure is commonly referred to as utilitarianism. Utility or utilitarian arguments are familiar in the assessment of the ethical acceptability of research involving human participants and are also common in political debate.

### Human Research Ethics

The principle of beneficence is drawn on in human research ethics where it has three related but distinct meanings. In its expression as meaning “acting beneficently,” beneficence is relied on to support a general obligation of researchers for the welfare of research participants (NHMRC). In its expression as the principle of utility, the principle has a more specific function. The underlying purpose of research involving human participants is to discover new knowledge or understanding of the effects on humans of change, typically biomedical interventions, or shifting social or environmental contexts or experiences. As the design of much research requires human participants to be exposed to these interventions, contexts, or experiences, they will also be exposed to some degree of risk in their experience of them.

The principle of beneficence, as utility, is relied on to assess whether such exposure is justifiable. The principle requires researchers to demonstrate that any risks to which participants are exposed by their participation can be justified by the likely

benefits of the research, whether to the participants, a defined community, or to society at large. Where researchers cannot demonstrate this, there will be an ethical objection that the research cannot be conducted in that form and needs to be modified to reduce the risks to which participants will be exposed.

The principle also informs the judgement of whether a human research project will have benefits, either for the participants, a defined community, or for the greater good of society generally. In this role, the principle carries the broader, charitable meaning. In conventional biomedical human research, the nature and scope of benefits can usually be readily defined by reference to a particular condition or an affected population, and the notion of benefit is of the improved well-being of that defined population.

In biomedical research involving disadvantaged communities, for example, among indigenous communities in developed countries, the principle of beneficence has been invoked to mandate that any research involving these populations generates benefits for the community – often benefits that are beyond immediate outcomes of the research, for example, benefits where the inclusion of community members in the design and conduct of the research develops individual and community skills. In human research in social sciences, the principle has been called on to justify research that deliberately seeks to emancipate disadvantaged communities, in ways that are beyond the immediate benefits of the research (Oliver 1992).

Here, beneficence is given a meaning and function beyond merely justifying the risks to which participants will be exposed. Instead, the principle is used in its original sense as a beneficial action that goes beyond the obligations of researchers for the welfare of research participants or the justification of risks to them.

## The Conceptual Contexts of Beneficence

### Obligations and Virtues

In clinical health practice, there has been much emphasis on the conduct of individuals,

especially where there exist clear professional or moral obligations to others. A common example of where the ethical obligations of health practitioners form a touchstone for distinguishing conduct which merely fulfills those obligations from conduct which goes beyond them (and is accordingly beneficent) is where health practitioners offer help in emergencies to people not their patients.

In medical ethics, analysis by reference to the virtues preferred in professional conduct has provided alternative ways of describing beneficent conduct by focusing on the disposition or character of the professional rather than a character of the professional act. For example, desired virtues are said to include fidelity to trust, compassion, justice, fortitude or courage, temperance, and self-effacement (Pellegrino and Thomasma 1993). However, such equation does not reflect the established understanding of beneficence as describing conduct rather than character.

### Paternalism and Autonomy

In medical ethics, beneficence was sometimes equated with an unacceptable level of paternalism. This was the result of the practice of some health professionals, in their application of beneficence in its guise as the principle of utility, of determining for others which consequences were good and therefore beneficent and which were not. Sometimes, these determinations were made by reference only to a professional view or opinion of what constituted good outcomes or good professional conduct. There is an implicit recognition, but often a discounting, of detrimental consequences for patients. The now discarded aphorism “doctor knows best” was a popular description of this practice.

Since the 1970s, there has been an increasing recognition of the ethical obligation of health professionals to respect the capacity of patients to make their own decisions about their health care. Implicit in this respect for autonomy is the acceptance that it will be the patient who decides which outcomes are good for her and which are not. This has compelled a change in the criteria that are used

to decide which outcomes are beneficent and which are not. Similar moves have occurred in other professions.

### Justice and the Complexities of Social Consequences

When the context more closely resembles public health than clinical health practice, some members of a community may be positively affected by an action while others are disadvantaged. In such a context, a utilitarian calculus helps identify the decision that will result in the greater good for the greater number.

Some care may be needed to make clear that such an outcome is a failure to act beneficently and not an injustice. Acting unjustly involves the denial of rights, whereas, by contrast, as noted at the outset of this chapter, beneficent conduct is voluntary and not in response to or in recognition of rights.

The context of a business decision, particularly, by a corporation, is likely to generate similar considerations. The important starting point for such an ethical assessment will be the obligations that the corporation owes to its stakeholders, who have a right to their interest being preferred, as well as to broader communities and the environment.

## Big 5 Personality Types and Willingness to Justify Unethical Behavior

Aditya Simha and K. Praveen Parboteeah  
University of Wisconsin – Whitewater,  
Whitewater, WI, USA

### Introduction

Personality research is robust and published across national and cross-national contexts. There are a plethora of articles, books, and monographs that deal with the broad subject of personality. There are several journals that focus entirely on publishing personality-based research – this includes many reputed journals such as *Journal of Personality*, *Journal of Personality and Social Psychology*, *Personality and Individual Differences*, *Journal of Research in Personality*, and *Journal of Personality Assessment*. Personality also happens to be a multidisciplinary area of research, with a lot of the research on it coming from anthropology, criminology, business administration, psychology, sociology, and education, among other disciplines.

There are several frameworks for studying and researching personality; however, the most prominent and popular one among the lot is the Big 5 Personality Type framework (e.g., Azucar et al. 2018; Holman and Hughes 2021; Judge et al. 2002; Wall et al. 2019). The body of research and literature base consisting of the Big 5 Personality Typology is especially abundant. The various personality types from this framework are used independently in studying workplace outcomes such as job attitudes, organizational commitment, and job satisfaction. They have also been used to study variables associated with business ethics variables, such as unethical behavior and ethical reasoning. One commonly studied variable in ethical reasoning is willingness to justify unethical behavior, and Simha and Parboteeah (2020) investigated the relationship between personality and willingness to justify unethical behavior. Willingness to

justify unethical behavior is a measure that captures the extent to which individuals justify behaviors that are ethically suspect. This includes items like “willingness to accept bribes” and “stealing property.” This encyclopedia entry succinctly presents the findings from the Simha and Parboteeah article (2020).

### Big 5 Personality Types and Willingness to Justify Unethical Behavior

The Big 5 Personality Type framework consists of five different components, namely, Openness to Experience, Conscientiousness, Extraversion, Agreeableness, and Neuroticism. A popular acronym used to denote this framework is OCEAN, where the first letters of the five types make up the acronym. Openness to experience refers to an individual’s disposition to actively seek out novel experiences, and seek out and implement new ideas and new methods. Conscientiousness refers to an individual’s disposition to be reliable, organized, and goal-oriented. Extraversion refers to an individual’s disposition to be outgoing and social with other individuals. Agreeableness refers to an individual’s disposition to be kind, generous, and approachable with others in interpersonal relationships and interactions. Neuroticism refers to an individual’s tendency to brood and be emotionally unstable.

Individuals can have a range of scores on all of these five dimensions. Some can be highly extroverted and low on conscientiousness, while others can be disagreeable yet highly open to experience. These various dimensions all go together in forming the personality of individuals, and influence how those individuals react to various situations and stimuli. Simha and Parboteeah (2020) examined how the Big 5 personality dimensions are associated with willingness to justify unethical behavior. They only considered three of the personality dimensions, in particular, conscientiousness, agreeableness, and openness to new experience. This was done in order to preserve model parsimony, especially because their model involved moderating effects of national culture.

## Main Effect and Moderated Hypotheses

The main effect hypotheses proposed that conscientiousness and agreeableness would be both negatively associated with willingness to justify unethical behavior, while openness to experience would be positively associated with willingness to justify unethical behavior. Additionally, several moderating hypotheses were proposed, which suggested that national culture dimensions such as assertiveness, performance orientation, institutional collectivism, and humane orientation would all moderate the overall main hypotheses.

Assertiveness is a national culture dimension which reflects beliefs that individuals in a society must be assertive and tough in their interactions with others. Institutional collectivism is a national culture dimension which reflects beliefs that individuals must take actions that are best for their social group. Humane orientation is a national culture dimension which reflects the degree to which societies emphasize and reward generosity and kindness in individuals. Performance orientation is a national culture dimension which refers to the extent that individuals in society encourage innovation and improvement in performance (e.g., Bame-Aldred et al. 2013; Cullen et al. 2004; Simha and Parboteeah 2020).

Essentially, humane orientation and institutional collectivism were hypothesized to strengthen the negative associations between personality and willingness to justify unethical behavior; whereas assertiveness and performance orientation were hypothesized to strengthen the positive associations between personality and willingness to justify unethical behavior. It was possible for the authors to examine these moderating effects, because of the nature of the dataset itself, which included data collected from respondents from many countries.

## Methods, Analysis, and Findings

The data used for testing the various hypotheses pertaining to the research model was collected from the World Values Survey's national probability sample, and the national culture dimension

values was obtained from the GLOBE study. The final sample tested included over 38,000 individuals from 23 countries, including countries like Algeria, Hong Kong, and South Africa. The initial sample had data from over 60 countries; however, the data pertinent to personality was only available for 23 countries. The analysis used to test the various hypotheses of the study was Hierarchical Linear Modeling, because the data were at different levels of analysis. For instance, the moderating variables were at the national level of analysis, but the independent and dependent variables were both at the individual levels of analysis.

The findings in Simha and Parboteeah's article indicated that two of the main effect hypotheses were supported. The results indicated that both conscientiousness and agreeableness were negatively associated with willingness to justify unethical behavior. There was no support for the hypothesis suggesting the positive association between openness to experience and willingness to justify unethical behavior.

With regard to the moderated hypotheses, some of the hypotheses were supported in a direction contrary to the original theorizing. For instance, the hypotheses with collectivism as a moderator had an unexpected finding. The study found that the positive relationship between openness to experience and willingness to justify unethical behavior was stronger in high collectivistic societies, contrary to what was proposed. The original hypothesis pertaining to conscientiousness and willingness to justify unethical behavior was supported. Another counterintuitive finding was found where the relationship between openness to experience and justification of unethical behavior was stronger in higher humane orientation societies. However, the other hypotheses pertinent to conscientiousness and agreeableness were supported in the case of humane orientation.

There was another unexpected finding pertaining to performance orientation. It was found that the relationship between agreeableness and willingness to justify unethical behavior was stronger in societies with high performance orientation. The hypothesis pertaining to openness to experience was supported though, where the relationship was stronger in high performance

orientation societies. Similarly, there was an unexpected result for assertiveness, where it was found that the relationships between conscientiousness, agreeableness, and willingness to justify unethical behavior were stronger in societies with high performance orientation. However, the other hypotheses were supported in the direction that they were hypothesized in. These counterintuitive findings suggest that sometimes national cultural dimensions affect personality types in unfathomed ways.

## Implications

There are several useful implications from the Simha and Parboteeah (2020) article. One of the biggest practical implications is that managers should invest time to assess the personality of their employees. Personality has interesting ramifications for workplaces and leadership, and in particular, conscientiousness is a variable that almost always has universal positive outcomes. In particular, managers of organizations operating in different countries should pay heed to how the national cultural dimensions of various countries affect personality's relationship with ethical reasoning.

## Introduction

The gathering, use, and analysis of data has become a huge enterprise, with every field benefiting from the identification of key patterns, providing recommendations, and pioneering innovations, that would not have been possible, otherwise. As a result, the value of data has been heralded as the new oil and the data industry is set to continue growing into the future. This has come from larger, richer, faster, and more effective

forms of data and the tools that we have at hand to analyze it. This transformation has taken place, whereby we can capitalize on the massive amounts of data generated by new technologies like smartphones, CCTVs, social media platforms, and smartwatches. This has been named the “Big Data Revolution” (Richards and King 2014), or more skeptically, “the surveillance economy” (Zuboff 2015). It has brought innovative advantages, such as being able to receive personal offers based on our interests, track health conditions through wearables, study the spread of viruses by tracking users’ locations, or search for terrorists through facial recognition. There are also many competitive advantages for business, for instance analyzing consumer shopping habits can optimize efficiency and improve customer engagement. All of this is fundamentally supported by the large swathes of data that underpin these technologies, often referred to as “Big Data” to differentiate it from nondigital data or digital data of very limited range, size, or ability.

While the Big Data Revolution brings a vast wealth of advantages, it has become a powerful tool that can also harm and limit many aspects of people’s lives, and these issues require ethical analysis. With the massive gathering of people’s data, it also generates privacy scandals and surveillance activities that can be harmful to citizens (for example, the Ashley Madison data leak that revealed the identities of its users, and thus their infidelities). Facial recognition, AI, deep learning, and voice recognition also create a “chilling effect”<sup>1</sup> that many people started to experience. The scandals of Facebook-Cambridge Analytica and Snowden revelations are excellent examples of that. In 2013 Snowden showed the world how governments and security agencies can surveil all citizens from an entire country as the National Security Agency (NSA) was surveilling American citizens’ (and political leaders, for instance, Angela Merkel) calls and other forms of online communications like emails or social networks

(Lyon 2014). Cambridge Analytica’s company demonstrated the possibility to change entire elections results by manipulating people’s voting choices through Facebook data and Big Data analysis.

## Big Data Analysis

Big Data is often defined with the famous 3 Vs (volume, velocity, and variety). It must contain specific technical properties, such as up to 10x the quantity of data about an individual transaction collected (*volume*), an increased point-of-interaction speed (*velocity*), and incompatible data formats (*variety*) (Idem). Nonetheless, the processing of large volumes of data remains simply a technical capability if it is not related to goals or objectives. In contrast, the capacity to gather Big Data goes together with technologies that can *analyze* high volumes of data mainly in an automatic manner, which is too big for human beings to process, such as machine learning (ML) and artificial intelligence (AI). For example, Netflix’s algorithms decide the order in which films appear to the users (depending on the decisions taken from thousands of variables – data – to calculate their relevance), and Uber uses ML (pricing algorithms) to make autonomous decisions to determine the price of a trip from many different data points.<sup>2</sup>

While Big Data refers to the technical 3Vs, its relevance lies in the analysis, and it is defined as “the capacity to search, aggregate and cross-reference large data sets” (Boyd and Crawford 2012). Big Data appears with “Big Data analytics,” “data mining,” or “metadata.” Data mining refers to the disclosure of patterns within the data without previous intent, while data analytics contains hypotheses and develops models using analytical methods. Data mining can sometimes be part of data analytics, and both derive “metadata,” which refers to new data that can be subtracted

<sup>1</sup>“Chilling effect” here refers to a negative feeling that a person experience when being watched or surveilled. It can involve self-censorship, self-restraint, or silence effects to the people experiencing it.

<sup>2</sup>Uber uses information about your battery status, weather, day (holidays), history, location, time of day, or how much rush are you in (if an individual can wait around 15 minutes the price can be lower).

from previous datasets, and provides additional information, e.g., an Instagram picture has geolocation data attached, or from the faces can be gathered micro-expressions that can derive psychological insights.

However, not everything is advantageous in terms of Big Data, and there have been many nefarious and unethical consequences in recent years. Data can bring a *lack of personal freedom* because of how much companies know from their users. Several authors have questioned these techniques, such as Boyd and Crawford (2012) asked:

*Will large-scale search data help us create better tools, services, and public goods? Or will it usher in a new wave of privacy incursions and invasive marketing? Will data analytics help us understand online communities and political movements? Or will it be used to track protesters and suppress speech?*

Different authors address the challenges that raise several difficult ethical issues for researchers and industry regulation. For example, one needs to identify what types of additional information is provided by metadata, who controls it, and what is it being used for. The ethics of Big Data emerged as an area of research that questions the problems associated with Big Data and proposes values and norms that will guide its use.

## Big Data Ethics

Big Data ethics<sup>3</sup> informs about how data can be used ethically and gives principles and values to decide how to use it. The values and norms proposed within this area of research aim to influence laws and guide the use of data. The field of Big Data ethics is expanding with new digital technologies and applications, such as the creation of smart cities, robots, or biometric technology, where data fuels their development and innovation. Thus, this field relates to other ethics' fields – bioethics, ethics of AI, business ethics, Internet ethics, or the ethics of robots. This section has been evaluated through an extensive literature in

Big Data ethics (Richards and King 2014) (Boyd and Crawford 2012) (Diaz and Gürses 2012) (Chen and Quan-Haase 2020) (SHERPA 2019) to present a list of the most significant issues in this field.

**Privacy:** Privacy is a fundamental human right that plays an important role in human life. It has become a tool to balance and limit the analysis of Big Data in a surveillance economy (Zuboff 2015). Although it is a broad concept that has been first defined as the right to be left alone, privacy can be understood as a protection against abusive practices and harms to individuals from industries, governments, and other people (e.g., hackers). It receives different interpretations such as: property, confidentiality, control over individual information, or interpreted as someone's ability to access their data (Diaz and Gürses 2012). There is a tension between individual and group privacy, current regulations (GDPR) protect personal data (individual) but allow for large-scale analysis if it does not contain personal information (groups), such as if data is anonymized. Individuals are at the center of privacy concerns, ignoring the impact on groups. However, even if anonymized, data can be traced back to an individual by techniques of reidentification, which pose a threat to (individual) privacy. Similarly, the creation of group's profiles is also a threat to privacy, when the goal is to know information about groups which individuals belong to "often-times it is not the individual that is of interest, but the group to which that individual belongs" (SHERPA 2019, p. 45). This allows organizations to make inferences about people's genders, sexual orientations, economic backgrounds, etc., making possible to conduct research about how to manipulate people's emotional states (e.g., see the Facebook contagion study), thus reducing privacy (understood as control) (Marabelli and Markus 2017). *Informed consent* is one of the tools offered by the GDPR that protects privacy; it is a method to ensure that users know about how their data will be used. It is especially important for researchers that access public data without previous authorization, however sometimes individuals are not provided *clear information*, hidden under long and incomprehensive privacy policies.

<sup>3</sup> Sometimes also simply referred to as "data ethics," or broadly categorized as a form of information ethics.

**Biases and discrimination:** Big Data is far from neutral, and contains issues within the data regarding objectivity, accuracy, inclusiveness, and veracity (Chen and Quan-Haase 2020). Big Data, often autonomously, reproduce these biases. O’Neil (2016) explains how it contains *human biases and injustices*, such as the ones in the production of “risk scores” in crime detection, where low-income people get longer jail sentences because they have higher risk scores due to living in poorer areas, which perpetuates social discrimination, and damage their lives. Gender biases are also found in the data, it was demonstrated that men receive more ads of woman portrayed in a sexualized manner than the other way around, or Google show men more advertisements for higher-paying jobs. Studies conducted in politics have shown that individuals with better socioeconomic status are better represented in social networks disregarding the less privileged, and thus it is the data that are retrieved from them (Idem). Thus, Big Data systems require researchers or individuals that can analyze the data to search for biases “Making statistical claims about datasets relies on knowing where the data is coming from, accounting for weaknesses in the datasets” (SHERPA 2019, p. 31).

**Transparency:** Transparency refers to the capacity to explain technological processes, information about datasets, uses of Big Data, and the willingness to do so. Transparency instills a form of *accountability* as it opens about what a company or government is doing with that data, and whether this abides by ethical norms and law. It also helps to *inform* about the analysis and types of datasets used in the process, and helps to gain *trust* from individuals. It can show and thus improve *environmental issues* with the costs of electricity and carbon emissions used to store and process the data. Transparency has also led to tensions between openness and secrecy within corporations because data is an asset, and often a form of *intellectual property*, which organizations do not want to reveal to competitors, regulators, or free riders of their research. Furthermore, transparency of data may also violate on the end user’s privacy, revealing private information, or data that

can be deanonymized to identify them. Other problems deal with the “black box” of complex analysis that are too difficult for humans (and nontechnical individuals) to understand, thus transparency becomes difficult, if not impossible, in practice.

There is a tension within the literature about how much transparency is sufficient, in what contexts, and how to determine between an “obligation” and “request” for transparency. For example, there has been much controversy in recent years about the level of data that Internet service providers (ISPs) should provide about their citizens. In China, ISPs are required to provide user data to the government for searches, posts, and information that contravenes state policy, while also implementing strict censorship policies. However, much of this policy is in stark contrast to freedoms respected in the Western world (e.g., a search about a historical event, such as the “Tiananmen Square Massacre”), which has led to animosity as Google refused to give information to the Chinese authorities to punish and jail such citizens. Private organizations are left with the challenge of respecting citizens’ freedoms and privacy or abiding by legislation in countries requiring the transparency and use of their data.

**Power asymmetries:** Power imbalances increase with mass surveillance and manipulation through invasive marketing practices (and with generation of metadata which users do not know or can predict). This was visible with Cambridge Analytica scandal, where the abusive power (without consent) by the company allowed to influence not only individuals, but entire elections’ results. There is often a tension of power between traditional actors (states) and more powerful actors (such as the “big five” IT companies). Big Data is being used as a political tool, both as a surveillance tool by traditional political actors, but also as a means of negotiation power by new actors, such as Google. There is a clear tension between whether large ICT companies should abide by all national policy of the country they are based or whether they have a legitimate say in how they should respond to that country, e.g., in 2020 Twitter banned the former president Trump and develop a discussion about the power and

influence of social networks in free speech and politics.

**Identity:** Identity refers to the possibility to define “who you are,” but the type of information that one receives and believes has a strong influence over one’s self-identity, choices, freedoms, and individual autonomy. Big Data influences what an individual sees, reads, and interacts with, and because the data is becoming more personalized, there is the potential to influence individuals’ beliefs and decisions. For example, in advertisement, Big Data analytics decides what types of ads will be displayed, and can be used to coerce people into buying certain products. It is called a “filter bubble” (Pariser 2011) when previous behaviors determine the information an individual will receive, which denies them to see different types of information, such as in politics to hear different political parties’ opinions and contrast information. This bubble influence people’s information and thus their decisions and identities. Particularly, Facebook can derive feelings and emotions from the data retrieved to influence its users, even to the point to know when a person needs a “confidence boost,” where one is more vulnerable to the influence of ads. Facebook also has a service called “loyalty prediction,” which finds users who will change brand “alliances” and alerts advertisers to step in with messages to keep their customers.

**Trust:** Trust refers to the (good) relationship between the end users and the company or group in charge of data. There have been recent scandals where people protested linking WhatsApp users’ data to Facebook. It received a great deal of attention, with many other messaging services, such as Telegram and Signal, witnessing a huge surge in downloads. However, what most people were unaware of was that WhatsApp has been sharing data with Facebook since 2016 by default. There is a growing mistrust around surveillance, and the integrity of public bodies and companies has been damaged from recent data scandals. After the Snowden revelations, there were several protests and slogans such as “Yes, We Scan,” where people did not trust governments. This has only increased with new rights in data protection, and the obligation of notify leaks and hacked accounts

which made it more obvious. In recent years, companies have tried to repair some of this damage by implementing privacy by design techniques to support trust.

**Responsibility:** Responsibility is a complex value due to the problem of “many hands,” in which the complexity of Big Data practices and the variety of analysis, algorithms, companies, engineers, and the global nature of Big Data makes it difficult to find someone responsible. In addition, data analysis is often done in a “black box,” where it is unclear the process or reasoning behind autonomous decision-making. This creates an “accountability gap,” where it becomes difficult to identify who is responsible for the decisions being made by the autonomous system, a question that will be further elaborated upon in the “Artificial Intelligence Ethics” chapter of this book.

## Bioethics

Rebecca S. Feinberg and Craig M. Klugman  
Department of Health Sciences, DePaul  
University, Chicago, IL, USA

## Synonyms

Bioethics; Biomedical ethics; Medical ethics

## Introduction

Bioethics is the study of moral issues in the life sciences including medicine, nursing, research, biotechnology, public health, health policy and health law. Historically, the term was coined in 1926–1927 by German philosopher Fritz Jahr, who wrote about *Bio-Ethik* as the moral obligations between humans and nonhuman forms of life. In 1971 the American chemist Van Rensselaer Potter independently created the term “bioethics” to refer to the moral relationships between human beings and the environment. However, the word bioethics was usurped by American scholars and the Institute for Society, Ethics, and the Life Science (now known as The Hastings Center; founded 1969) and the Joseph and Rose Kennedy Institute of Ethics (founded

1971), who were interested in a broader view of medical ethics.

## History

Modern bioethics burst onto the international stage during the 1947 Nuremberg Trials of Nazi doctors. These trials provided the scientific community and world-at-large with detailed retellings of the atrocities performed under the label of *research*. Prisoners were used as study subjects, without their consent, for a variety of horrific investigations that amounted to torture. The resulting Nuremberg Code lists ten ethical precepts for conducting human subjects research, including the essential priority of protecting human subjects and ensuring that their participation is voluntary. This code was followed in 1964 by the Declaration of Helsinki, an international document focused on respect for the individual in the context of human subjects research. In 1966, Harvard anesthesiologist Henry Beecher published an article on the 25 most egregious examples of human subjects research abuse, followed 5 years later by journalist Jean Heller’s Associated Press article revealing the *U.S. Tuskegee Study of Untreated Syphilis in the Negro Male* to the general public. These abuses led to the 1979 publication in the Federal Register of *The Belmont Report: Ethical Principles and Guidelines for the Protection of Human Subjects of Research*, *Report of the National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research*. Known as “The Belmont Report,” the authors outlined three principles for conducting ethical human subjects research: respect for persons, beneficence, and justice.

Beyond research ethics, the initial focus of the field of bioethics was on medical ethics, particularly in the United States and United Kingdom. Drawing on the traditions of the Hippocratic Oath and the works of Moses Maimonides, Abūbakr Mohammad-e Zakariyā-ye Rāzī, John Gregory, and Thomas Percival, early bioethics was concerned with the fiduciary physician-patient relationship, including the obligations and duties

of confidentiality, truth-telling, and informed consent. This integration of medical ethics into bioethics was part of a patients-rights movement that sought to limit the paternalistic power of doctors and make patients a partner in their medical decisions. Thus, modern bioethics strongly emphasizes *autonomy* (i.e., self-governance).

## Principlism

In 1979, philosopher Tom Beauchamp and religious studies scholar Dan Childress published *The Principles of Biomedical Ethics*. Drawing on what they called “mid-level common sense principles,” they established autonomy, beneficence, non-maleficence, and justice as the core of U.S. bioethics, a concept exported to much of the world. In Asia, the Confucian tradition adds a fifth principle, *compassion*—love of others (Tai and Lin 2001). In Europe, a larger emphasis has been placed on the idea of *solidarity*—membership in a community or group with shared interests (Prainsack and Buyx 2011). The trend outside of the USA is to focus on more communitarian rather than purely individualistic approaches to bioethics.

The rise of new technologies expanded the application of bioethics. Organ transplants, artificial kidneys, ventilators, and molecular biology (including genetics and assisted reproduction) offered promise but also peril. Who gets access? Who pays for it? Are there limits to how and when they should be used? Scholars of bioethics brought the knowledge and skills to help make these challenging bedside and policy decisions.

## International Context

The formal establishment of a bioethics infrastructure led to national commissions, academic centers, journals, and professional associations. In the United States, the creation of the Society for Health & Human Values (1969; now part of the American Society for Bioethics & Humanities) standardized the field. While bioethics began in

the United States, it has spread around the world, often through deliberative efforts (e.g., U.S. Fogarty Program in Eastern Europe, the Caribbean, Latin American, Africa), attempts to attract foreign investment and collaboration (Singapore), or home grown (South Africa, UK, Western Europe).

This international movement found its fullest expression in the 2005 UNESCO Declaration on Bioethics and Human Rights which goes beyond medical ethics to include protection for future generations, the environment and the biosphere, echoing Jahr’s original vision. Bioethics created an interdisciplinary and secular ethics for the life sciences based on humanistic moral philosophy (e.g., Aristotle, Kant, Bentham, Mill, MacIntyre, Noddings) rather than appealing solely on religious grounds. While bioethics begins in the 1960s with theologians, physicians, and lawyers, it quickly attracted philosophers, historians, literary scholars, other humanities professionals, and the social scientists.

### Introduction

Bitcoin and the underlying technology of *Distributed Ledger Technology* (DLT) also known as Blockchain first touched surface with a whitepaper authored under the pseudonym Satoshi Nakamoto (2008) regarding Bitcoin, the first and up-to-date most broadly known cryptocurrency. The current value of only the principal cryptocurrency Bitcoin has surpassed 1 trillion USD in February (Forbes 2021) and its exchange rate is characterized by risky volatilities allowing for extreme gains and losses, possibly also leading to macroeconomic instability.

Bitcoin has since been emulated by more than 4500 different cryptocurrencies or altcoins (Statista 2021). The groundbreaking novelty of blockchains consists in decentralized registers,

where every transaction is verified without a central authority and then saved on a “chain” of henceforth unmodifiable data blocks. Apart from cryptocurrencies and their employment for monetary transactions, blockchains are used for registries, smart contracts, identifiers for goods, or to bring more transparency to supply chain management, just to name a few applications (for an overview see Dierksmeier and Seele 2020).

The ethical implications of blockchain technology are still emergent as is the technology itself. The current pace of development is particularly relevant for ethical assessments, as it allows free riders to take advantage of unregulated territories and legal gray zones – or the dark net, where not only unethical but downright criminal transactions are paid for by cryptocurrencies. Apart from obvious regulatory questions, the technology also imposes new questions regarding the societal management of trust. By obviating the need for conventional intermediaries, blockchains’ decentralized transactions create novel environments where relations of personal or institutional trust are no longer needed nor supported. A direct implication is the impact on jobs and welfare: Many pundits prognosticate job losses, as – from a merely technological viewpoint – traditional intermediaries are to become less and less necessary to safeguard business transactions. Consequently, a reflection from a business ethics point of view is overdue, which tries to identify both pro-social potentials and potentially harmful implications. Below, we take a first step in that direction, first with a view to blockchains in general and then targeting cryptocurrencies in particular.

### Blockchain and Distributed Ledger Technology

Technically the most important feature of a blockchain is that it is close to impossible to alter its ledger in which specific transaction data are stored combined with a timestamp. Once a block has been saved on the blockchain, its alteration would require that all other blocks would have to be changed as well, which is extremely

difficult given the decentralized peer-to-peer authentication process and the cryptographic safeguards in place. Consequently, a central authority or entity cannot dominate the blockchain easily.

The major advantage stemming from blockchain technology is increased transparency and exactitude challenging existing, human transaction-based verification and business models (Kuebler 2018), which are subject to manipulation, fraud, and other unethical activities. Furthermore, through automated and trustworthy registries transaction costs may be reduced drastically. Accordingly, wild hopes and speculations, all the way from libertarian and even anarchist thinkers up to staid investment bankers, have been triggered by this new technology.

Some use cases and applications may elucidate the propensities of the technology at large<sup>1</sup>:

One application context highly relevant for business ethics is supply chain management, particularly when each item moving along the supply chain is connected to the internet-of-things via identifiers and sensors. Rendering the long chain of transactions from resource to consumer product transparent via openly legible blockchain protocols, efforts in sustainable sourcing and corporate responsibility gain more credibility. Such corroboration techniques can be found in blockchains issued by VeChain in tandem with PwC or in similar products proffered by IBM or Circular, just to name a few (Ng 2018). Generally, we may distinguish between open platforms such as VeChain and closed ones where companies advance their own proprietary supply chain monitoring systems, as is the case mostly in the luxury sector for products like diamonds with a unique molecular structure, unique pieces of art, or products with unique identifiers like cars (Dierksmeier and Seele 2020: 352). Ethically favorable effects in train are the prevention of theft and counterfeit products, plus full disclosure of the supply chain – as in the case of diamonds – when it comes to compliance with ethical standards regarding

environmental or societal issues (like human rights and the prevention of child labor).

Where some such blockchain applications thus promote social responsibility and sustainability, other use cases of the technology are clearly unethical and/or criminal. Blockchain technology enables crimes hitherto impossible. In the case of “cryptojacking” computers are infected with a software that, unbeknownst to the owner of the system, engage in the mining of cryptocurrencies. Such “cryptojacking” can lead to systems failure and, in consequence, impair critical infrastructure, for example, in the energy or security sector. Similarly, supercomputers are often held at ransom or entirely shut down as acts of terrorism or war. Cryptojacking thus exemplifies how blockchain technology facilitates highly unethical and outright criminal activities.

A more ambiguous phenomenon is the effect of DLT on trust. As blockchain-based smart contracts allow for decentralized and cost neutral transactions in real time, many conventional intermediaries and third-party assurers such as banks or notaries may become obsolete. On one hand, technologically enabled “trustless trust” solutions are considered not only as more economical, but also as more equitable: With power comes the potential for its misuse through dominating behavior and a reckless pursuit of self-interest. Blockchain technology promises to dissipate power concentrations due to its decentralized nature. Combined with the lower threshold of participating in formalized transactions like notaries, when cost is close to zero, DLT may be seen as democratizing economic activities and boost commercial activities at the base of the pyramid. On the other hand, the advance of such impersonal verification processes may, in the long run, change our overall perception of trust and human interactions altogether – with as yet unforeseeable consequences for society at large (Drescher 2017).

A last macro-ethical context of concern is the potential for the centralized governance of blockchain technology, as currently under foot in China as part and parcel of the “Belt and Road Initiative” (BRI), connecting Asia, Africa, and Europe. Whereas ethicists have thus far greeted

<sup>1</sup> The examples in this entry are summaries of Dierksmeier and Seele (2020), where also other examples and more details are presented.

blockchain technology as a harbinger of a future democratic and participatory digital infrastructure for the entire world, some pundits think that China's state-backed blockchain service network has countervailing objectives, having been designed rather to become the "one and only infrastructure provider for blockchain firms around the world" (Pan 2020), thus eviscerating the libertarian charm the technology initially exuded.

## Cryptocurrencies

Bitcoin is a first-generation cryptocurrency. Unlike Bitcoin, more recent cryptos enable "smart contracts" (second generation) and also typically separate platforms from "tokens" (third generation). Furthermore, some are even jettisoning the original blockchain principle and working with alternative software models (such as "directed acyclical graphs" (DAG), the so-called "tangles") (Swan 2018). These differentiations matter for the ethical evaluation of cryptocurrencies. Many of the shortcomings of digital currencies (such as high energy costs) are typical for first-generation cryptocurrencies, especially Bitcoin, while, conversely, much of what defenders of blockchain technology hails as its moral potentials can only be realized with second- and third-generation currencies (Dierksmeier and Seele 2018). Today, for example, there are currencies such as SolarCoin, whose allocation is not associated with energy consumption but with the supply of additional alternative forms of energy, and several others whose transaction times and costs converge toward zero.

But there are not only abstract-general benefits, but also concrete, previously disadvantaged groups of people who might be better off as a result of cryptocurrencies. After cryptocurrencies could be exchanged on cell phones, such as Bitcoin via the M-Pesa system in Kenya, the prices for sending remittances dropped dramatically (Dierksmeier and Seele 2018). At the same time, the anonymity and fraud-proofing of digital portfolios helps many people accumulate smaller assets for consumption or investment purposes

who previously had to forgo the security of their own account management, either because they were unbanked or because access to their services was hampered by corruption or discrimination. In particular, women, who are still denied financial autonomy in many societies, are among the most eager users of these new options to independently access and dispose of their earned wealth as they see fit (Tapscott and Tapscott 2016).

Replacing trust with transparency, or personal contacts with network control, the use of cryptocurrencies does not only eliminate the need for intermediaries (such as middlemen, banks, notaries, or confidants), there is also no risk that these intermediary individuals or institutions will charge unduly for their services or, worse, abuse the trust placed in them. As a consequence, the cost of commercial exchange among strangers decreases. This development, in turn, not only entails direct primary economic benefits, but also has indirect secondary social effects. If it is true that trade helps to balance out selfish passions through economic interests (Hirschman 1977; Asbach 2014), then the cheapening and acceleration of commercial transactions – and especially the integration of previously economically marginalized individuals and classes that they bring about – must be chalked up as moral gains.

Moreover, effects on the monetary system as a whole deserve attention. Before the age of cryptos, most people had little choice about which means of payment to use. They had to avail themselves of state-sanctioned and/or market money. In nondemocratic states, this completely deprived them of a say in monetary affairs, for instance, regarding the overall amount of liquidity. But even within democracies, political participation in monetary decisions has been substantially impaired by the fact that central banks, first, are often exempt from democratic influence and, second, affect only a fraction of the total amount of money in circulation, because a much larger share of liquidity is created by the private banking system. Add to this the financial competition among nations and things are not looking particularly good for the monetary

autonomy of citizens even in democratic states (Felber and Gupta 2014).

Not surprisingly, then, more and more people are shifting savings into cryptocurrencies. It is not just the plight of the destitute and the greed of speculators at work here. Much of the force of this movement comes out of the middle of society (Lee and Low 2018). Since cryptocurrencies are deliberate creations of their programmers, who, out of a competition for users, are engaging in a contest of ideas, suddenly citizens get to both ask and answer the question what characteristics their money ought to obtain: Should it be protected from inflation by a preprogrammed spending maximum? Must similar protection against deflation also be provided? Should the payments and their transaction history be anonymous or transparent? Or would a happy medium be best, for instance, via pseudonymity or a partial exposure of the transaction chain? By what means shall the currency be generated or “mined,” including through ecologically or socially questionable processes? Is the cryptocurrency solely for payments or ought it also allow for the arranging and settling of mutually conditional services by way of automated “smart contracts”? Is the code of the respective crypto fixed once and for all, or should the user community be able to alter it, and, if so, in which aspects? Should possibilities for codesign be reserved for certain user groups? Would a “one member, one vote” principle be appropriate, or rather a hierarchy of participation based on proof of work, proof of stake, or proof of cooperation?

Today, people from all around the world decide all of these questions by acquiring certain cryptocurrencies rather than others. Thus, use is design. Every use of a cryptocurrency contributes to a selection process in which, in the long run, those digital monies that most reliably meet the expectations of the most customers will prevail. Over time, and through this very process of winnowing, the extreme volatility in the crypto scene can be expected to diminish and give way to some largely stable currencies as market leaders, which will perdure until their services are either no longer needed or are provided by more attractive competitors (Hoberman 2018).

For the first time in history, a broad range of global citizens can nowadays withdraw portions of their wealth from the risks of their national governments’ monetary policies or the equally risky liquidity enhancement by commercial banks. In this way, they reduce the power of politics and vested financial interests, which may be welcomed or deplored, depending on one’s point of view. In any case, however, this third alternative increases the resilience of the global financial system; standing on significantly more feet, this system will emerge more resistant to crises in certain reserve currencies such as the dollar.

What citizens give up (or, rather, have long since lost) in terms of *direct* political power to shape monetary policy may be regained *indirectly*: by fleeing a private or state currency management that they deem unfavorable. This will set effective impulses for change. As states and banks cannot function without the money of their citizens and customers, they must sooner or later react to those evasive movements in much the same way as transfer banks had to react to the decline in remittance payments: by better meeting the demands of their respective clientele (Dierksmeier and Seele 2018). The competition that cryptocurrencies pose to the *status quo* is thus presently having the very effect that the pioneers of the social market economy envisioned for the salutary effect of free competition in the first place: as an instrument of disempowerment (Eucken 1952); the digital currency market is acting as a “discovery process” (von Hayek 1968) for monetarist preferences in a globalized world.

## Closing Remarks and Future Topics

Since blockchain technology and its most relevant application cryptocurrencies are relatively recent phenomena, there are still many open questions and, for the time being, we will face ongoing innovations, which are likely to pose new ethical challenges. Regulatory efforts to govern this novel, disruptive technology are required, as blockchain and cryptocurrencies are frequently

used in manifold criminal and unethical activities (Seele 2018). Governmental action should be informed, though, by recent academic research so as neither to be remiss of their protective function nor proceed as bluntly as banning cryptocurrencies in general, as Turkey did in spring 2021 when it altogether interdicted the use of cryptocurrencies as payments. Since the full range of both the favorable and the less favorable ethical potentials of DLT is yet to be uncovered, further research from a business ethics perspective is to be called for.

## Boycotting as a Social Movement

Mark C. Vopat and Alan E. Tomhave  
Department of Philosophy and Religious Studies,  
Youngstown State University, Youngstown,  
OH, USA

## Synonyms

Blackball; Exclude; Ostracize; Sanction; Shun

## Introduction

The term “boycott” was coined in Ireland in the late 1880s. However, boycotts had been used as a vehicle for social protest and change long before

that. A boycott is variously defined as the withholding of certain types of social or commercial interactions with another person, business, corporation, organization, or nation. The reason for this withholding varies, but it generally expresses disapproval, is intended as a form of punishment, or is used as a means of forcing acceptance of certain terms.

One early American example of an effective boycott was that surrounding the protest of the Stamp Act passed by the British Parliament in 1765. The tax required that the colonists pay a tax on every piece of paper that they used. This included all paper used for ship manifests, legal documents, newspapers, and the like. In response to this tax, the American colonists engaged in a boycott of all British goods. The result of this boycott was the repeal of the tax after members of the parliament received numerous complaints by British merchants who were losing significant amounts of money.

## Who Boycotts

Boycotting has been utilized by a diverse number of groups as a way of promoting their cause. Some of the groups that have engaged in boycotts include African Americans, Mexican Americans, Chinese Americans, Jewish Americans, labor organizations, and religious groups, along with activists for animal rights, environmental rights, women's rights, and LGBTQ rights. The reasons for engaging in a boycott are as varied as the groups supporting them: social justice, fair wages or working conditions, fair prices, and the upholding of purported societal values have all been used as the basis for collective action. Whether these reasons for engaging in a boycott are sufficient to ground a moral justification for any particular boycott is an open question. Boycotts may be effective at achieving some desired end, but effectiveness is not synonymous with the moral appropriateness of the ends sought.

## Effectiveness of Boycotts

Boycotts have had varying degrees of effectiveness – though determining whether a boycott has been effective raises numerous philosophical questions. Effectiveness depends in part on what those engaging in the boycott express as their desired ends. If the end is a change in the policies, practices, or actions of a business, corporation, or state, then there is a measurable outcome. For example, if the purpose of the outcome is to force a business to stop selling clothing produced using child labor, then it is possible to determine whether they have complied. Groups such as the Human Rights Watch and the Interfaith Center on Corporate Responsibility (among others) provide up-to-date information on subjects such as child labor. On the other hand, determining whether the boycott has changed the attitudes or beliefs of the target of a boycott is more problematic. Those boycotted may change their actions or policies but may do so for less than moral reasons. It may be that a boycott protesting unequal pay for women employees may result in a consciousness-raising moment wherein an employer sees the inherent unfairness of his actions and revises company policy to address the issue. It is far more likely that some combination of cost in terms of customers, public image, or profits is the real motivation for the change. Consequently, the effectiveness of a boycott depends on the chosen goal of the boycotters. Consequently, it is possible that a boycott may have good consequences without actually being a “success.” The target of a boycott may change their policies without engaging in a corresponding change in beliefs. It is also possible that a boycott could never end if the views of the target never change.

If we define the effectiveness or success of a boycott in terms of a specified outcome (e.g., a change in policy or a reduction in the price of a good), then boycotts have often proven effective. There are numerous examples of boycotts that have resulted in both short-term and long-term success. Of course, whether a boycott's success

is ultimately a good thing depends on one's perspective as well as the moral justification used to support the boycott.

One of the areas where boycotts have had long-term success is the call for social change. Some of these include the bus boycotts of the 1950s that took place in Louisiana, Alabama, and Florida, which were successful at putting economic pressure on the bus companies. This pressure eventually led to permanent changes in seating policies for African Americans.

Internationally, boycotts have been used to affect social change through economic pressure. The salt boycotts of India and the boycott of South Africa were both utilized to end the social injustice found in those countries. Economic pressure was used to effect social change and has been seen by many as an important element in the eventual change that occurred.

Unlike boycotts targeting social injustice, those seeking economic fairness, namely, consumer boycotts, have been less permanently effective. These types of boycotts – known as commodity boycotts – target a particular good, e.g., milk or sugar, irrespective of who sells the good. Meat boycotts organized between 1902 and 1946 were successful in bringing down prices. In the 1970s there were several food commodity boycotts. Commodity boycotts targeted particular foods rather than any particular business that sold the commodity. Boycotts of meat, milk, sugar, and coffee were a response to perceived unfairness in the pricing of these goods. These later boycotts were successful at temporarily lowering prices so long as the boycott continued. Once the boycott ended, prices would slowly return to their pre-boycott levels.

One set of boycotts that has enjoyed particularly long-term success has been religiously based boycotts. In the late 1920s, the National Legion of Decency (NLD) was established by Catholic bishops to boycott films that violated the Motion Picture Production Code (MPPC) otherwise known as the Hays Code. Prior to 1934, most studios had adopted but rarely enforced the code.

Similar results were realized when the television industry was targeted by the National Federation for Decency after it had joined with Jerry Falwell's Moral Majority in the early 1980s to form the Coalition for Better Television (CBTV). The CBTV organized boycotts that were successful at getting corporations such as Procter & Gamble to pull out 50 network television programs. Such boycotts also affected the editing and programming on networks such as ABC.

## Bribery

Laurence Cockcroft

Transparency International (UK), London, UK

## Synonyms

Corruption; Extortion; Graft; Subornation

## Definition

A useful definition of bribery is “an inducement improperly to influence the performance of a public function meant to be gratuitously exercised” (Noonan (1984) points out that the meanings of the components of this definition vary with cultures and over time.).

Broadly speaking, each of the main religious traditions have condemned bribery as an integral part of corruption as readings from Judaism, the Bible, Islam, the Hindu Scriptures, and Confucius confirm (Cockcroft 2012). Each of these traditions are especially clear on the bribing of judges which societies across the world have always condemned with varying degrees of effectiveness. More contentious has been the allocation of a public office which has more often than not been subject to forms of bribery. In most of western Europe, the USA and Canada only in the nineteenth century did bribery come to be rejected on a scale which warranted legislation (and with conspicuous exceptions, particularly in the political arena). This change of attitude was in part the result of rising middle class prosperity and a sense that the public good was being undermined by corruption of which bribery was a constituent part.

Although this legislative action is less than 150 years old, there had been important cases of bribery causing degrees of public outcry over a far longer period. The Roman Republic struggled with the question of the bribery of its all-Italy electorate in legislation which spanned a century

(between 181 and 81 BC) and which set limits to the total level of “bribes” which could be paid – in both cash terms and in terms of the special allocation of seats at public events. In England, the offence of bribery was first investigated by a Royal Commission and identified and made the subject of legislation in the reign of Edward I in 1285 (Ref. the Second Statute of Westminster 1285; described in *Studies in the Hundred Rolls*, Cam (1921). See also John T. Noonan, op. cit, pp. 231–237). The year 1621 saw the full drama of the Lord Chief Justice of England, Francis Bacon, brought low on the charge – to which he pleaded guilty – of accepting huge bribes to fix judgments. The diarist Samuel Pepys, Secretary to the English Navy from 1639–1645, recorded the bribes he had received to award contracts for the rigging of ships. The framers of the US Constitution in 1787 were adamant in their desire to avoid the bribery of MPs by the government of the day which characterized the British Parliament. In the American Civil War, contracts were so susceptible to bribery that the “Lincoln Act” was passed which awarded to whistleblowers 10% of a contract found to contain fraud and repaid to government. It was only under the Pendleton Act of 1883 that the “spoils system” of the USA which had enabled politically appointed civil servants to profit from the award of contracts was finally outlawed. These cases all involved payments to affect the allocation of public resources. The question of “private to private” bribery (or the secret payment by the executive of one company to sway the decision of the executive of another) was addressed in the UK by the “Secret Commissions and Bribery Prevention League,” a civil society group, which achieved legislation outlawing such payments in 1906 and whose work was matched in Germany by the “Society Against the Abuse of Bribery” (Verein gegen das Bestechungsunwesen.) which was active from 1913 to 1935. In the UK, the 1906 legislation unleashed more than a hundred cases in the courts (Crew 1913) which showed the extent to which bribery had come to be used as an intercorporate weapon. The legislation in Germany had led to a large number of cases in the courts by 1913.

After World War II, the rapid expansion of western companies in many parts of the developing world led to an unprecedented surge in the use of bribes to obtain contracts awarded by the public sector. This “extraterritorial” bribery was not covered effectively by existing anti bribery legislation. Its extent was revealed in hearings held by the Senate Subcommittee on Multinational Corporations in 1975 chaired by Senator Frank Church in hearings which were triggered by the Watergate scandal and in parallel investigations by the Securities and Exchange Commission. The SEC investigation found that more than 400 US companies maintained overseas accounts for the purpose of paying bribes. The Foreign Corrupt Practices Act (FCPA) which resulted from these hearings was the first attempt to criminalize bribes paid overseas to foreign public officials by US companies, an initiative only followed in the remainder of the OECD in 1997 (and even later in the legislation of most member states). Today, the 35 member states of the OECD (and six other signatories) have legislation which varies in its formulation criminalizing the bribery of foreign public officials. This legislation has proved to be only partly effective and has not led to enforcement across the range of participating countries.

International surveys – such as the Global Corruption Barometer coordinated by Transparency International – confirm that bribery is a reality in the everyday lives of more than half the population of the world. Most significantly, it is the key to access many public services designed to be free but for which gatekeepers charge a fee. This may extend to policemen, the medical profession, and teachers, as well as to local councillors and politicians. For example, in Pakistan, in 2010, 43% of those surveyed by the national chapter of TI reported that they faced a demand for bribes when interacting with local government and 69% when dealing with the judiciary. A 2010 survey in Kenya found that urban citizens dealing with government expected to have to pay a bribe in 40% of cases (Cockcroft, *ibid.*, pp. 61–62.). Such payments are often deemed to be in the category of “petty bribery” but in fact their cumulative cost can amount to more than 15% of an urban dwellers income with a disastrous impact

on the welfare of households and families. Payments of this kind may be demanded on an “ad hoc” basis by the officials concerned or they may be part of an organized “scam.” Where such scams exist, it is particularly difficult to break the system, given the strength of vested interests from the top.

In shaping measures to combat bribery, there remain significant gray areas. These range from the practice of “trading in influence” (the selling of government contacts by elected politicians) to the “revolving door” (where those in elected or appointed government jobs may favor a company which later gives them a job). They extend to the question of sexual favors where these are provided by an individual hired or acting for the bribe payer. “Trading in influence” is covered by the UN Convention on Corruption of 2003 but has not been translated into the legislation of many member states. The “Revolving Door” issue is the subject of legislation in several national contexts – including the Honest Government and Open Leadership Act (Jointly sponsored by Senator John McCain and (then) Senator Obama in 2006.) in the USA – but remains a widespread abuse.

A separate but contentious issue is the question of “facilitation” or “grease payments” where these are made to speed up an action (such as access to public records or clearing a container at a port) rather than to trigger it. The FCPA allows such payments but more than half of the OECD members’ legislation disallows them. There are, however, very few cases in which such payments have been prosecuted in any OECD country.

In response to the changing substance of legislation in relation to bribery (and other forms of corruption), the international corporate sector has responded with specific codes of conduct designed to ensure that staff of companies are well aware of the potential penalties involved. These have included the “Rules of Conduct” of the International Chamber of Commerce (1996), the “TI Principles for Countering Bribery” (2003), and the Partnering Against Corruption Initiative (PACI) of the World Economic Forum (2005). Codes based on these templates have been adopted by many quoted companies, so that where bribes are still paid, it is a conscious

decision to take the risk of detection. These initiatives have been matched by moves by the regional International Financial Institutions (IFIs) to ensure that the award of contracts which they finance is not subject to bribery. The World Bank (WB) initiated this process in 1997 quickly moving to a regime of “black listing” by which offending companies can be prevented from bidding on contracts funded by the WB either for a specific term or indefinitely. This system has now been adopted by all the regional IFIs which accept the “black lists” of each other. However, the number of cases where bribes have been paid involving blue chip companies since the OECD Convention was signed in 1997 (Including Siemens, BAE Systems, Walmart, and GSK) confirm the difficulty of erasing corporate bribery.

Organized crime merits specific consideration in the context of bribery. Long-established operations by organized crime include both protection rackets (where for example shopkeepers are offered “protection” for a fee) and control of parts of the construction industry (where contracts are allocated to a limited list of contractors who pay off criminal organizations like the mafia). Payments made to such criminal organizations can be construed as a continuous stream of bribes, enforced by the threat of physical violence including murder. The bribery of politicians by organized crime is very well-established and has existed for more than 150 years in Sicily but is now also prevalent practice in cities as geographically distinct as Mumbai and Buenos Aires and characterizes the relations between drug cartels in Mexico and local Mayors and police chiefs.

“Modern” bribery is not different in nature to bribery recorded in classical times, but its scale and sophistication continues to grow and evolve. At its heart, however, it still triggers action which enrich the individual (either in kind or cash) but undermines the public good.

## Introduction

The concept of bribery is important to our thinking about ethics, especially in professional contexts. This is in no small part due to the thought that, as Seamus Miller has put it, bribery is “a paradigm of corruption” (Miller 2018, pp. 4–5). Business persons and corporate entities are often evaluated by how well they remain free from, root out, and punish corruption – especially in democratic societies. It is a common thought, for example, that a democratic institution ought to be free from corruption. Since bribery is often thought a form – perhaps the *paradigmatic* form – of corruption, bribery, too, serves as a central concept in our evaluations of business persons and corporate entities.

Although there is no consensus as to what *exactly* constitutes bribery, theorists have at least converged on some common elements of bribery. This article will lay out three common elements which together are characteristics of bribery (payment, intention, and wrongdoing), and then briefly illustrate how this conjunction of elements allows for distinguishing between bribery and two other questionable acts often examined in the context of business (grease payment and extortion). It is worth clarifying up front that this article concerns the *ethical*, rather than *legal*, notion of bribery.

## Elements of Bribery

Paradigmatic cases of bribery involve, in some way, *payment*. As noted by John Douglas Bishop (2004, p. 3), the “classic case of bribery” involves giving “money to any person with the intention of encouraging that person. . . to violate any legitimate moral obligation.” Paradigmatic though such cases may be, bribery clearly need not involve money. As John Danley (1983, p. 22) observes, it is clear upon reflection that more or less *anything of value* may serve as a bribe. Suppose a business person offers free and specialized consulting to a democratically elected politician in exchange for altered voting behavior. Though such an arrangement involves no promise or exchange of money, it is a clear case of bribery.

Although theorists have tended to converge around an element of payment as crucial to bribery, it is clear that one need not actually *make* any payment (or materially *transfer* anything of value) in order to be engaged in an act of bribery. In the above example, the mere act of *offering* the consulting services seems sufficient for being engaged in an act of bribing. This is why many have, like Danley, provided the disjunctive condition of bribery, as requiring the giving *or* offering of something of value. It is in this more general sense that bribery is universally thought to include an element of payment.

In addition to the element of *payment*, bribery necessarily involves an element of *intentionality*. Of course, not just any payment or offering value

to another person constitutes bribery; instead, a bribe is a *payment with a purpose*. While the specific nature or content of that purpose (or *intention*) is the subject of controversy, all analyses have in common some connection to *wrongdoing* (the third basic element of bribery).

Some, like Bishop (2004), D’Andrade (1985, p. 329), and Turow (1985), hold that bribing someone is intended to “induce that person to commit an improper act.” On this view, the wrongdoing which the act of bribing is intended to produce need not have any particular nature; so long as someone is by prospect of value intentionally induced to do *something* wrong, bribery is afoot.

Others, like James, Jr. (2002, p. 71), hold that bribery is intended to induce an *agent* of a principal to do something contrary to their duty *qua agent of principal*, and therefore also to do something which is not in the interest of the principal. On this view, bribery is only possible within the context of an agent-principal relationship.

Others still, like Danley (1983), Carson (1985, p. 71), Noonan (1984), Philips (1984), and Pritchard (1998), hold that a bribe must be exchanged for something which would be “incompatible with the duties of the office, position, or role” of the bribee. On this view, the wrongdoing elicited by an act of bribing is neither completely general nor limited to agent-principal relationships. Instead, the wrongdoing takes the form of *abandoning the duties of one’s station*, as it were – violating duties specific to a role occupied by the bribee.

Unsettled controversy aside, notice that, on any of these three characterizations, an act does not count as an act of bribing if the incentivized action *merely happens* to be wrong. Rather, the bribe must be intended to produce the wrongdoing, and so the briber in some sense must be *aware* that the act they hope to induce would be wrong.

Putting these three elements together, bribery may be specially, even if generally and not finally, characterized as an *exchange* involving a *briber*, who *gives* or *offers* something of value to some other person (the *bribee*) with the intent that the bribee does some act which would be wrong –

either by its general nature, or due to the specific role that the bribee occupies.

This provides some hint as to *why* it is that bribery is (usually) wrong. One who *offers* a bribe performs an action intending that that action will result in wrongdoing. Plausibly, it is generally wrong to intend to induce others to do wrong. One who *accepts* a bribe either (i) does indeed perform the wrong act which the bribe is intended to induce or (ii) at least implicitly agrees to perform that wrong act. It is self-evident that cases of the first type involve wrongdoing. With respect to cases of the second type, we may observe the plausibility of the thought that it is generally wrong to (genuinely) agree to do wrong.

## Bribery and Other Business

Any satisfactory account of bribery must be able to answer the question as to what distinguishes *bribery* from two other phenomena related to and sometimes confused with bribery: *grease payment* and *extortion*. The above analysis of bribery allows for just that.

As Carson (1985, pp. 68, 79–80) notes, *grease payments* are payments made in order to *facilitate* or *expedite* routine or *normal* processes, events, or services. For example, a payment may be made in order to hasten the passage of goods through customs. Note that such a payment is not made in order to *obtain* passage of goods through customs – goods which would otherwise not be passed through. Assuming that the goods *should* be passed through customs, the grease payment is made to *facilitate* or *expedite* that *permissible process*. In other words, the grease payment provides incentive for the customs officials to *perform* their professional duties. This is exactly the opposite of the intended effect of a bribe, which is to incentivize *nonperformance* of duties. The fundamental distinction between *bribery* and *grease payment*, then, is made in the element of *intentionality*: whereas bribes are intended to produce wrongdoing, grease payments are not.

Extortion differs from bribery in at least two important aspects. Consider a paradigmatic example of extortion: a local mafioso enters your corner

store and threatens to destroy the place unless you pay him for “protection.” Clearly, the mafioso extorts you; but his action lacks the crucial elements of bribery discussed above. First, the mafioso does not necessarily offer you something of value; instead, he *threatens* you. Second, the mafioso need not intend to induce wrongdoing on your part; instead, he intends merely to extract from you *something* of value (money). If we can roughly (even if not definitively) characterize extorting as *using threat to improperly extract something of value*, it clearly diverges from bribery in the elements of payment and intent: while the briber offers something of value in exchange for some perceived wrongdoing, the extortionist threatens disvalue unless something of value is given.

There are of course other significant metaphysical, ethical, and legal questions related to bribery, which this article has not touched on or settled; for example, what is the precise nature of the wrongdoing involved in bribery, the moral status of making grease payments or extortion payments, and what corporate or public policies should be enacted to manage such things.

## Synonyms

Faith; Transcendence

## Definition

Buddhism is a religion that believes that everyone can transcend suffering and become buddha through devoutness. It is composed of beliefs, values, and practices, represented by Nirvana (liberation), Buddhahood, sutras, and commandments (Schein 1990). Buddhism is known for its four noble truths about suffering and three universal truths, which provide the criteria for justifying Buddhist thought. To be specific, Buddhism focuses on suffering's definition, reason, transcendence, method, and impermanence. In order to promote the universal salvation of human beings in physical world, Buddhist organizations concentrate on suffering, impermanence, restraint, mercy, retribution, and timeliness (Pan et al. 2012). Buddhism has infiltrated the traditional cultures of many countries, such as India, China, Japan, Singapore, Sri Lanka, Thailand,

Cambodia, Laos, and so on. Buddhism is often regarded as a social buffer or analgesic.

## Description

Buddhism was founded by Siddhartha Gautama, the prince of a small Indian province, between 565 and 486 BC. Due to the frequent wars, hierarchical caste system, and diversified thinking, Siddhartha Gautama wished to save his people from suffering. Specifically, the little prince attempted to help his subjects to transcend death, illness, and old age to achieve rebirth; in other words, liberation. After 6 years of trial and error, he suddenly found a solution under a pipal tree and became the first awakened person: the buddha. Finally, the buddha and his solutions attracted many followers, leading to the formation of Buddhism.

The Buddhist solutions to transcending physical suffering consist of four noble truths and three universal truths. On the one hand, the four noble truths refer to suffering, the root of suffering, the end of suffering (liberation), and the path to liberation. First, suffering (*dukkha*) is regarded as the essence of life, conveying the contradiction between struggle (pursue, desire) and failure. Second, the root of suffering (*samudaya*) is the endless cycle above contradiction, i.e., causality across lives. Third, the end of suffering (*nirodha*) involves transcending suffering at a spiritual level, which achieves the goal of liberation (Nirvana). Fourth, the path to liberation (*maggā*) is diversified, and the struggle must be correctly guided by sutras, commandments, and monks. Therefore, the four noble truths focus on the definition and reasons for suffering as well as the goal and path of transcending suffering.

On the other hand, the three universal truths form the core criteria for justifying the correctness of Buddhist thought, because Buddhists learn from the religious laws rather than specific people. First, the impermanence of everything is correct. Second, the interdependence and invariance of anything do not exist. In short, the above two points are two sides of the same coin. Third, the ultimate aim of Buddhism is to pursue liberation

(Nirvana) from suffering. Combined, the four noble truths and three universal truths constitute the beliefs and values of Buddhism.

However, the pursuit of liberation (Nirvana) from suffering is also a kind of struggle and can fail many times, which is inconsistent with Buddhism. There is a conflict in Buddhism regarding the struggle to pursue liberation. Although conflict exists, Buddhism helps us to view the world around us, and its beliefs and values become part of different national cultures, which boosts diversified practices, such as the arts and literature:

- *India* – India is the cradle of Buddhism. Buddhism spread across India in four stages. To start with, the first stage occurred between the sixth and the mid-fourth centuries BC and is called Original Buddhism. Buddhists spread Buddhism across India by Indian dialect. The second stage occurred from the mid-fourth to the first century BC and is named Sectarian Buddhism. Buddhism is divided into the west and east sectors. The former treats Siddhartha Gautama (the founder of Buddhism) as a human, while the latter considers him immortal. Thus, they gathered for the second council where they revised the commandments of Buddhism. Furthermore, the third stage occurred between the first and seventh centuries AD and is called Mahayana Buddhism. This type of Buddhism focuses on helping others to transcend suffering, while Theravada Buddhism concentrates on overcoming one's own suffering. Finally, the fourth stage was introduced between the seventh and thirteenth centuries and is called Secret Mahayana Buddhism. This was created to rival the other Indian religion, Brahman, which emphasizes physical action and obscuring words. After the invasion by Afghanistan at the end of the thirteenth century, Buddhism was replaced by Islam in India.
  - *China* – Buddhism spread to China by the Silk Road and foreign trade in the first century and was adapted to suit the Chinese context through localization. Due to the conflict with traditional Chinese Confucianism, Buddhism adheres to Taoism and Metaphysics by the way of Non-Action (WuWei) and being immortal at the beginning. Moreover, the appearance of eminent Chinese monks helped Buddhism strategically to compromise with both Confucianism and the imperial power; for instance, Chinese monks created new Buddhist sutras to illustrate filial piety, which is consistent with Confucianism, and also omitted certain inappropriate descriptions of women when translating sutras, deliberately to cater to Confucianism. Compared with Buddhism's spread in India, Buddhism in China was focused on the role of the emperor. Specifically, Chinese Buddhism emphasizes its role as a buffer and analgesic. Furthermore, the Chan Sect represents the emergence of localized Buddhism, with relative interdependence. During the Song dynasty (960–1279 CE), Buddhism becomes one of the mainstream aspects of traditional Chinese culture.
  - *Japan* – Buddhism spread to Japan from China in 552 CE and was adapted to the Japan context through localization. Many Japanese people participate in Buddhist rituals, even though they do not believe in Buddhism. Specifically, following the Meiji Reform, Japanese Buddhism abandoned many inappropriate rituals in Japan, such as the Buddhists' ban on marriage and meat. Although Japan does not focus on carrying out concrete Buddhism rituals, it has built up Buddhist schools and discusses Buddhist thought; for example, Chan Sect (Zen) is regarded as part of Japanese culture after World War II.
  - *Singapore* – Buddhism spread to Singapore through immigration, which was impacted by China and Japan. Moreover, Buddhism influenced immigrants, and so the residents of Singapore began with belief in Buddhism gradually. Buddhism is now considered the first religion in Singapore by a number of Buddhists.
- In order to infiltrate the culture of each unique country, Buddhism is transformed by the local people, such as monks and emperors. However, different countries choose different aspects of

Buddhism; for example, China finds a deep synergy between Buddhism and Confucianism at the level of belief, value, and practices, while Japan tends to accept rituals (practice level) as well as Zen (a sub-branch of Buddhism).

The localization of Buddhism developed in the previous centuries. At the end of the thirteenth century, the cradle of Buddhism was conquered by Islam, but Buddhism survives in other countries, such as China and Japan. Furthermore, localized practices have added new philosophies, commandments, and rituals to Buddhists' beliefs, values, and practices. The appearance of the Chan Sect (Zen) represents an eastern expression of Buddhism, which gives a fresh impetus to original Buddhism.

On the one hand, the deep communication between Buddhism and diverse national cultures produced a vast quantity of work in the fields of philosophy, art, and literature. In various countries, Buddhism became a source of wisdom and also the basis for a request for reform. The multinationalization of Buddhism saves people worldwide from suffering in the physical world and enables them to achieve liberation (Nirvana).

On the other hand, there is an increasing convergence between Buddhism and business practice by virtue of Buddhist businessmen (Foshang in Chinese). In the aspect of beliefs and values, Buddhist businessmen do not jockey for profits due to causality, restraint, and mercy from Buddhism (Pan et al. 2012). For example, Yang Xun, the chairman of board in Jeanswest International (Hong Kong), believes in Buddhist view of causality and mercy; thus he donates money and joins in social welfare activities rather than advertising for firm reputation. In the aspect of practice, Buddhist wisdom helps businessmen solve specific management problems. For instance, Wang Hai, the CEO of Doublestar Group, was once troubled by the higher failure rate of products. His employees merely worked for money regardless of higher product quality due to their limited economic and educational backgrounds. However, Wang Hai persuades his employees from Buddhist view of mercy and causality. His employees gradually believe in the opinion that improving product quality is one kind of mercy

for workers, which will benefit themselves in the future. Therefore, his employees pursue higher product quality gradually, and the normal pass rate of product in Doublestar is higher than 99%. As a result, Buddhist businessmen integrate Buddhist thoughts into ethical practice, which then boosts sustainable development of business.

## Buddhism and Business Ethics

Joan Marques

Woodbury University, Burbank, CA, USA

## Synonyms

Buddhist philosophy; Buddhist psychology; Moral behavior

## Introduction

As humanity gets confronted in ever-greater abundance with global trends and concerns, interest in spiritual practices is also increasing. Some relate these spiritual practices to religious foundations, while others prefer to keep the two phenomena – religion and spirituality – separate. Regardless of one's preferences, there has been

an overall growing fascination with Eastern traditions, whereby Buddhism could be considered the most prominent. The influence of Buddhism has particularly risen in recent decades due to an increasingly fertile climate toward change (Marques 2010).

## Buddhism: A Snapshot

Buddhism is, for many of its practitioners, not considered a religion, but more a philosophy or psychological stance. Yeshe (1998) phrased it this way:

When we study Buddhism, we are studying ourselves, the nature of our own minds. Instead of focusing on a supreme being, Buddhism emphasizes more practical matter, such as how to lead our lives, how to integrate our minds, and how to keep our everyday lives peaceful and healthy. In other words, Buddhism always accentuates experiential knowledge-wisdom, rather than some dogmatic view. In fact, we don't even consider Buddhism to be a religion in the usual sense of the term. From the lamas' point of view, Buddhist teachings are more in the realm of philosophy, science, or psychology. (p. 5)

Indeed, Buddhism is non-theocratic, and the Buddha is considered an enlightened teacher rather than a god (Johansen and Gopalakrishna 2006). Because Buddhism offers its followers a worldview aimed at understanding, happiness, and development, Johansen and Gopalakrishna prefer to label it as “a moral, ethical, value-based, scientific, educational system, the goal of which is to allow the individual to discover the true nature of things (becoming enlightened) and, in so doing, escape from suffering and attain happiness-not only for oneself but for all sentient beings” (p. 238).

The individual generally revered as “the Buddha” was an Indian man by the name of Siddhartha Gautama, born in affluence, and raised in blissful ignorance until he got confronted by happenstance with illness, old age, and death. Having been withheld these facts of life while growing up, Siddhartha set out to learn more about the world. He first lived for several years as a recluse but at a certain point obtained

enlightenment through insight meditation (Vipassana). Based on the insights Siddhartha attained during his meditative state, he finally realized the illusion behind ego, or “I,” and the fact that without an “I” everything becomes one (Snelling 1991). Once enlightened, he changed his name to Buddha, which means “The Awakened One,” and became a popular teacher with many followers (Marques 2012).

## The Need for a Firmer Ethical Stance in Business

It is generally accepted that the twenty-first century brought new standards and emphasized the need for more morally sound ways of doing business. The assumptions under which business was practiced in the twentieth century, whereby mass production was justified and profit was the only aim in business dealings, have run their course (Gupta 2017). They are now obsolete and in desperate need for a more enlightened narrative, validated by two simultaneous trends: (1) increased collective awareness and (2) a dire need to shift away from an inappropriate way of performing (also see chapters ► “Corporate Psychopaths” by C. R. Boddy and ► “Narcissistic Leadership” by C. R. Boddy in Encyclopedia of Business and Professional Ethics). These two trends are actually interrelated: *because* of our increased awareness, sharpened by the rampant availability of information and communication streams, we realize the error in our prior notions about business and its purpose. The call for more conscious leaders should also not be underestimated within this context as a result of our increased collective awareness. Today's employees yearn for leaders that are receptive to giving back to their communities and elevate their conduct beyond self-interest (Kemavuthanon and Duberley 2009). The time has arrived to shift our paradigms from growth prioritization to a focus on cultivation of life-sustaining resources. Profits are an important strategy for corporate evolution, but in our day and age, another evolution requires more attention: the evolution of life and, therewith, the safeguarding and restoration of critical

resources, along with a focus on initiatives and actions that promote a better quality of life for all occupants of planet earth (Marques 2017).

It is most likely the increase in collective awareness that has served as a catalyst toward the growing interest in Buddhism, since Buddhism is very focused on consciousness and the transformation this can bring to one's understanding and behavior. The overarching focus in Buddhism is to convert ignorance and mindlessness into empathy and mindful practice. Thich Nhat Hanh (1998), a globally renowned Buddhist leader, explains that transforming our ignorance through consciousness leads to wisdom.

## Buddhism and Business Ethics

Explaining the intersection of Buddhism and business ethics is easy and difficult at the same time. Easy, because there are so many grounds on which this intersection is justified, and hard, because space for explaining and analyzing all these grounds is limited. Within this chapter, the justification for adhering to Buddhist psychology in business will therefore be limited to four perspectives:

### – *Accepting personal responsibility for actions*

Buddhism strongly emphasizes the concept of cause and effect, explaining that our current circumstances are a result of prior decisions and actions. In popular terms, this concept is also referred to as karma. Because karma is considered factual, followers of the Buddhist psychology or philosophy will be mindful of their actions (Thondup 1995). It is therefore also more likely that adherence to the Buddhist mindset will discourage mean-spirited and predatory actions.

### – *Understanding the importance of healthy detachment*

Detachment is yet another strong virtue in Buddhist practice. This entails that a business practitioner following this mental model will understand the fleeting nature of everything in life and work and will have less control issues,

power hunger, or profit insatiability. Such a person will refrain from defining himself or herself through positions, titles, or possessions, knowing that they are all impermanent. As can be gathered, the foundational principle behind detachment is the fact that its opposite, attachment, is the main reason for much suffering among humans (Metcalf and Hatley 2001).

### – *Nurturing the will to collaborate with others*

It may be its origins in a collectivist tradition that encourage Buddhist practitioners to open themselves for greater collaboration and less selfishness. It may also be the foundational realization of the ego as a barrier toward interconnectivity (an important insight shared by the Buddha), which drives this mindset. Additionally, the understanding of karma as a driver toward doing the right thing should not be underestimated. At any rate, today's business environments call for heightened levels of collaboration, which further increase the appeal that Buddhist psychology has on twenty-first-century performance.

### – *Practicing right livelihood*

Right livelihood is one of the elements of the "Noble Eightfold Path," in Buddhism also known as the "Fourth Noble Truth." The four noble truths are foundational in Buddhism and basically entail that suffering exists (first Noble Truth), suffering has a cause (second Noble Truth), suffering can be ended (third Noble Truth), and the way to end suffering is through the Noble Eightfold Path (fourth Noble Truth). The Noble Eightfold Path encompasses the following practices or insights: Right View; Right Intention; Right Speech; Right Action; Right Livelihood; Right Effort; Right Mindfulness; and Right Concentration. There is no specific sequence in this set of insights, because they are interrelated (Marques 2017).

A Buddhist practitioner will refrain from wrong livelihood, which means not being engaged in destructive practices, or those that can lead to harmful outcomes. Consequently, engaging in Right Livelihood means that one has

**Buddhism and Business Ethics, Fig. 1** Buddhist psychology as a foundation for business ethics

to think deeply and broadly about one’s professional performance and consider the effects of this performance onto other living beings, human and nonhuman, on the short and long term (see also chapter ► “[Meaningful Work](#)” by A. Veltman in Encyclopedia of Business and Professional Ethics).

Figure 1 depicts the four perspectives on which we justify Buddhist psychology as a suitable way toward increased business ethics in this chapter. The figure also captures the considerations that support our notion that the business world may be ready for such a consciousness-based moral mindset.

## Concluding Thoughts

The Dalai Lama (2005) affirms that the highest spiritual ideal in Buddhism is to foster empathy for all living beings and contribute toward their well-being as much as possible. We have no shortage of challenges in the world today: starvation, illness, war, discrimination, abuse, rejection, and greed – the list is expansive and disheartening. Turning these challenges into virtues can only happen through enhanced collective awareness and mindful performance. Yet, a collective movement can only happen when each participating individual makes it a point to engage in the right conduct. Business, as the most powerful entity

worldwide, is in need for a narrative that supports personal responsibility, healthy detachment, collaboration, and the practice of right livelihood, as explained above. Given the development it can bring, business has the advantage to penetrate in the furthest corners of the globe. Considering the practice of Buddhist, psychology may instigate a long-overdue breakthrough in the way we perform in business, reduce the existing suffering, and make earth the respectful, compassionate, and ethically sound habitat that only we can make it.

## Business and Ethics of Capital Punishment

J. Angelo Corlett

Philosophy & Ethics, San Diego State University, San Diego, CA, USA

## Synonyms

Criminal execution; Death penalty

## Introduction

Capital punishment is the state’s purposeful execution of a legal offender according to due process of law. Depending on the jurisdiction, it might involve lethal injection, electrocution, firing squad, hanging, etc. The business of capital punishment concerns the everyday manner in which the system of capital punishment functions, while the ethics of capital punishment concerns the normative justificatory status of both the institution and practice of capital punishment. The institution of capital punishment includes the rules and regulations which govern its practice, which is the carrying out of the death sentence on duly convicted first-degree murderers, certain war criminals, and others strongly responsible for such crimes deserving of execution. Among other things, the business of capital punishment concerns itself with the practical viability of capital punishment, that is, the extent to which the institution and/or practice of it is economically feasible. On the other hand, the ethics of capital punishment concerns the extent to which the institution and/or practice of capital punishment ought to become legal. The business and ethics of capital punishment converge rather well when considerations of justice and economics are taken seriously. And one context in which this has come to light is in the State of California wherein in November of 2016 the institution and practice of capital punishment was re-approved by popular vote, while another proposition was approved that will, it is promised, bring substantial changes to the manner in which capital punishment will be

administered. This coincides rather well with a newly developed philosophical theory of capital punishment which directly addresses the business and ethics of capital punishment.

### Views About the Moral Justification of Capital Punishment

There are numerous views on the moral justification of both the institution and practice of capital punishment. First, there is capital punishment retentionism, according to which the institution and/or practice of capital punishment is morally justified as each exists currently, say, in a particular society and under a particular legal system. One concern with this view is that capital punishment is sometimes administered unfairly with innocents being either executed or offenders being over-sentenced. Another concern is that the practice of capital punishment costs the state too much in that inmates often wait decades until the final disposition of their cases, thereby violating, in the United States, the federal constitutional right to speedy due process. It is difficult, then, to remain a capital punishment retentionist in light of such difficulties.

The polar opposite view from that of capital punishment retentionism is capital punishment abolitionism, a view which denies that capital punishment is ever morally justified and that it can ever be made to function well economically. But this view also faces difficulties, namely, because it often relies heavily on the unproven assumption that there is an absolute and non-conflictible human right to life. This view often also assumes that the practice of capital punishment is “uncivilized” (Reiman 1985). There are, of course, counterexamples to the claim that no one deserves to be executed for even the most heinous offenses: former US president Andrew Jackson for his primary policy-making role in the genocide of American Indians, former US president George W. Bush for his causing the unjust military invasion and occupation of Iraq, David Westerfield for the first-degree murder of Danielle van Dam wherein there was much clear evidence and absent mitigating circumstances (see *California v. Westerfield*), etc.

Moreover, it states, because sometimes innocents are executed, the very institution of capital punishment ought to be abolished. However, that some innocents are executed is not a sufficiently good reason to defeat the claim that those who deserve (satisfy strongly the conditions of liability responsibility for the crime of genocide, first-degree murder, etc.) to be executed should be executed. Finally, for those who assert that those legal systems which employ capital punishment are uncivilized, one must recall that name-calling constitutes an ad hominem fallacy.

Capital punishment suspensionism is a newly developed and defended position on capital punishment which states that the institution of capital punishment is morally justified, but that the practice of capital punishment ought to be suspended until certain important reforms have been made to the institution and practice of executing the most serious offenders (Corlett 2014: Chap. 9). It recognizes that some cases of capital punishment are very easily identifiable, such as the ones mentioned in the previous paragraph. And this is all that is needed to justify the institution of capital punishment. Moreover, in such cases, the practice of capital punishment is most definitely justified due to the heinous natures of the crimes committed (i.e., genocide, starting an unjust war, first-degree murder). For one to deny (rather than prove) that capital punishment could ever be morally justified would be to deny any plausible principle of proportionate punishment as well as to deny that criminals could ever qualify as responsible agents deserving of execution. Yet with the counterexamples just marshaled, such an abolitionist claim seems unfalsifiable and hence implausible. That capital punishment sometimes is or could be morally justified, then, implies the need for its being institutionalized by law. Yet this alone does not justify the practice of capital punishment, as that would occur only to the extent that certain individuals qualify for the death penalty. If none do, then capital punishment would not be justified. If some do, then capital punishment would be justified in those cases. But to decide a priori whether or not capital punishment is morally justified is hasty at best, as how does one know whether or not a most serious offended

deserves it, whether past, present, or future? Thus, the institution of capital punishment must stand as a legal apparatus just in case there are such qualified candidates for the death penalty.

So just as capital punishment retentionism is problematic in that it refuses to even suspend the practice of capital punishment until the system is changed in order to safeguard against injustices in the execution of the most serious offenders, capital punishment abolitionism is problematic in that it unfalsifiably denies that any person can genuinely qualify for the penalty of death and that because some innocents are executed that none should be – even those who are duly convicted! In light of the above considerations, then, capital punishment suspensionism is the most reasonable position to adopt with regard to the punishment of the most horrendous duly convicted legal offenders.

However, it is one thing to clarify which general position is the most reasonable, yet it is quite another to explicate that position in some detail. Capital punishment suspensionism is in need of further explication, and doing so in light of the business of capital punishment seems to be a promising manner in which to do so. What precisely is capital punishment suspensionism?<sup>1</sup>

## Capital Punishment Suspensionism

The economic objection to the practice of capital punishment links to the unfairness objection and states that insofar as the practice of capital punishment is economically problematic in costing the state too much of its budget to carry out such sentences, it is unfair to the state and to the inmates to continue to incarcerate them for such lengthy periods of time prior to their executions. The main reasons for such pre-execution wait times is because, as in the state of California, habeas corpus petitions and appeals can take more than 20 years to process due in part to the fact that there is a shortage of qualified capital punishment defense attorneys to handle them. There is also a glut

concerning the State of California's Supreme Court which is charged with handling such matters. Thus, the glut leads to the tremendous cost of capital cases to the State of California. So the State of California's failure to invest the resources necessary in order to efficiently process such cases costs the state dearly and leads to the unjust over-incarceration of inmates, violating their constitutional rights to speedy due process. One proposed solution to this complex problem is to either reform the system of capital punishment in California such that sufficient resources are allotted to the institution of capital punishment in order for it to carry out capital sentences within a timely fashion and accurately or abolish both the institution and practice of capital punishment (Alarcon and Paula 2011).

Corlett (2014: 164f.) answers that this proposed solution commits a bifurcation fallacy of the following kind: either properly reform the institution of capital punishment or abolish both the institution and practice of capital punishment. Since the defenders of this position insist that the institution of capital punishment in the State of California cannot be adequately reformed, they argue for the abolition of both the institution and practice of capital punishment. The reason why this constitutes a bifurcation fallacy is because capital punishment suspensionism represents a plausible attempt to suspend the practice of capital punishment (in the State of California) in order to reform the very institution of capital punishment (in the State of California) so that the practice of capital punishment in the State of California can resume with moral integrity and economic efficiency. Thus, capital punishment suspensionism represents a third viable view between the two extremes presented by the proposal mentioned above.

Capital punishment suspensionism has a three-pronged proposal to reform the system of capital punishment in the State of California. The first part of the proposal is the Law School Innocence Program, the second is the Inmate Worker Program, and the third involves the compensation of incarcerated innocents.

The Law School Innocence Program (LSIP). This would be a voluntary program for law school students to participate for course credit during their final term of study (10–20 h per week).

<sup>1</sup> (What follows is a brief summary of capital punishment suspensionism as it is found in Corlett (2014: 164f)).

Each of the accredited law schools would participate, and each would want to compete for the distinction of being the one that trains the finest LSIP team which participated in the exoneration or lowering of sentencing of the most death row inmates in the State of California. It would also create prospective careers for their graduates of the program. Once these students gain expert law professor-supervised expertise in capital cases, they would be encouraged to apply for a full-time salaried position in the Habeas Corpus Resource Center (HCRC) or the Office of the State Public Defender (OSPD). Only about 2% of all such law school graduates in the State of California each year would be needed for this program to have sufficient numbers of legal personnel. In order to ensure such participation at the said level of the LSIP, 6 years of full-time excellent quality service is required in order for such attorneys to receive full forgiveness of their law school tuition by the State of California. It is conservatively projected that the LSIP would provide at least 100 such trained experts in capital cases per year who would be qualified to serve in either the HCRC or the OSPD, thereby constituting an unprecedented team of experts critically examining the case file of each death row inmate in the State of California (currently of which there are about 800). Each death row inmate would have a team of two to three full-time expert attorneys working her case, thereby dramatically working through the backlog of death row inmate cases awaiting final dispositions. This provides better justice for the inmates, as each will either be exonerated more quickly than otherwise or be executed more quickly. In either case, speedier due process is achieved throughout the backlog of cases. But simultaneously, the cost of incarcerating such inmates reduces significantly as older cases are handled first, until the most recent death row case is disposed.

The LSIP would take about 20–25 years to work through the backlog of death row cases. In the meantime, the practice of capital punishment could be suspended for about 10–12 years until there is sufficient number of full-time attorneys in the HCRC and the OSPD to provide the unprecedented expert legal representation that each current

death row inmate deserves. The overall quality of legal representation in such cases is indeed unprecedented perhaps in the world. But it is what justice requires, especially in capital cases. Once the suspension period is over and the newly and dramatically reformed system is functioning well, then executions of those who did not earn exoneration can and should resume without apology. For the best expert representation in the United States would have been afforded such inmates – from the law school students to the expert attorneys at the HCRC, the OSPD, and the additional judges and staff provided at the Superior Court level to handle such cases instead of the Supreme Court of the State of California. It turns out that with the State of California investing a great deal of resources each year to fund the LSIP, it almost pays for itself in terms of how many years into the future (once the LSIP program begins after the first 3–4 years of its being established) that the state is not paying the cost of death row inmates which currently averages about 25 years before such cases reach final dispositions. Considering the average annual cost to incarcerate each death row inmate is about \$140,000, this represents a substantial savings for the State of California. After about 20–25 years of covering the current backlog of death row inmate cases in California, then each death row inmate after that would receive very speedy due process (about 5–6 years, after which time the State of California transfers the inmates to a federal facility wherein the federal government covers the cost of such incarceration) until the final disposition of their cases. Yet once the backlog of capital cases is disposed, then the law students in question, the attorneys at the HCRC, the OSPD, and the Superior Court can turn their attention to the oldest non-capital inmates and work through such case files to see if there are any innocents or over-sentenced inmates among them. Thus, the criminal justice system is crucially reformed and inmates of all levels and kinds receive speedy due process and unprecedented quality and quantity of legal representation. The LSIP addresses directly the concern that the system of capital punishment costs the state too much in terms of its constantly struggling budget. As has been demonstrated, the LSIP can eliminate the

backlog of death row inmate cases within 20–25 years, and it can almost pay for itself. Yet the LSIP, when coupled with the Inmate Worker Program, can not only generate millions of dollars so that the LSIP pay back the State of California for its investment in the LSIP, but it can generate excess revenue which can total about one billion dollars more.

The Inmate Worker Program. This program involves uncompensated penal labor in the form of hard agricultural work that is presently performed mostly by migrant workers. The State of California can contract with local agriculture owners, especially those with large farms so that inmate workers can be provided security, to provide legal labor at a cost at or just above what current farm workers earn. The benefit to the agriculture owners is that they are functioning legally, without fear of the law's interference with their production which sometimes leads to gaps in production when illegal farm workers are caught and deported. The benefit to the State of California is that earnings from a 40-h work week at said wage by each criminal inmate throughout the state is given directly to the state. Annually, the State of California will generate just over \$1 billion from this program. The inmate worker program, coupled with the LSIP, will generate about \$1 billion in revenue for the state. But some of this revenue should be used to both reasonably (relatively speaking) compensate the exonerated inmates from death row and otherwise and to better fund existing and create new viable social programs in order to prevent people from becoming criminals or becoming criminal recidivists.

Compensating the Incarcerated Innocents. Currently, the State of California allows for a *maximum* of \$100 per day for wrongful incarceration in one of its prisons wherein the former inmate can prove to the state that it had nothing to do with her conviction. But Capital punishment suspensionism would make \$100 a day the *minimum* that would be paid to such inmates. One reason for this is that some inmates, death row or not, were incarcerated at a time when their income was substantially greater than \$100 per day. Another is that time in prison for innocents amounts to a most heinous

wrongdoing and must be compensated in approximate proportion to the tremendous harm of unwarranted legal imprisonment.

But there is more to the business of capital punishment than even the foregoing. It is also important that the state implement viable and affordable social justice programs in order to combat the conditions that lead to criminal behavior in the first place. A reasonably just society would do well to use some of its inmate worker program revenue to fund such programs as it constitutes a wise investment in people who might be able to be assisted to live productive and meaningful lives. Along these lines, John Rawls' theory of justice has much to offer, especially in term of his difference principle according to which the least advantaged in society ought to benefit no matter which law or policy is instituted (Rawls 1971).

## Conclusion

Thus, it is clear that capital punishment suspensionism can work in the State of California and perhaps elsewhere. It creates hundreds of new and well-paying and permanent legal careers and jobs. It reduces tremendously the wait period of incarceration from sentencing until the final disposition of cases such that death row inmates received speedy due process. And it creates a revenue base for the State of California to generously compensate the wrongfully convicted and innocent inmates both on death row and throughout the criminal justice system. It strengthens considerably the business side of both the institution and practice of capital punishment, and in a manner which comports with genuine moral justification.

## Business and Human Rights

Hugh Breakey and Charles Sampford  
Institute for Ethics, Governance and Law, Law  
Futures Centre, Griffith University, Brisbane,  
QLD, Australia

### Synonyms

Moral rights; Natural rights

### Introduction

Only a few decades ago, the prospect of aligning business and human rights seemed unlikely. Businesses were widely seen as private enterprises whose goal was to make profits, while human rights were standards of international law imposing treaty-based obligations on state signatories.

Yet increasingly the interaction between human rights and business has strengthened. Community expectations for business continue to change, pressing towards a more ethical approach to profit-seeking. At the same time, the powers of businesses – especially large multinational corporations (MNCs) – have been expanding relative to states. Further, due to globalization, MNCs have begun major operations in countries where human rights of employees and local communities are not guaranteed, and can be negatively impacted by business activities (Sampford 2012). These ingredients of capability, proximity, and impact are common devices for attributing moral responsibility (Campbell 2006).

Nevertheless, there is significant contestation over what exactly human rights require of businesses. Despite important developments in settling and institutionalizing these requirements, controversy and fluidity remain.

Some of this fluidity stems from unresolved definitional and philosophical questions about human rights themselves. To be sure, many aspects of human rights are relatively settled. Historically, human rights developed out of natural rights thinking in the early enlightenment. These gave rise to the “rights of man” invoked in the French Revolution and the “unalienable rights” in the US Constitution. The expression *human rights* attained significance in the mid-twentieth century with their invocation in the 1945 Charter of the United Nations, and subsequently in major international treaties. Their legal status in multinational treaties and state constitutions, and their institutional status at the United Nations, gives human rights a claim to being the world’s ethical lingua franca – though other normative regimes like “human security” and the Sustainable Development Goals should be noted.

Substantively, contemporary business ethics accepts the received view that human rights are especially important inalienable rights held by all individuals equally on the basis of their common humanity (Brenkert 2016, 3). While the precise content of human rights is disputed, the touchstone remains the list of freedoms and protections found in the “international bill of rights,” consisting of the 1948 *Universal Declaration of Human Rights* and the major treaties on civil, political, economic, social, and cultural rights stemming from the *Declaration*. Nevertheless, because of the expansive entitlements these invoke, some ethicists argue for a narrower, more achievable list of human rights.

As well as controversies about the inclusions in a list of human rights, unresolved questions about human rights include whether they are specifically Western (a concern about relativism); whether they are inherently legal or ethical obligations; whether they are morally basic or arise from other devices (such as a social contract); whether they derive their ethical force from concerns with human dignity, autonomy, or some other quality;

and, whether human rights function as “trumps” or whether they can be weighed against other ethical values (such as democratic lawmaking). Answers to these general questions about human rights impact on how they should apply to business specifically (Brenkert 2016).

## Business and Human Rights

In the close of the twentieth century, the rise of globalization and capitalism shifted the balance between business and state, creating new “governance gaps” where serious wrongs (including complicity with armed factions and modern slavery) could be committed by corporations without effective sanction from either domestic or international law.

This gave rise to increasing calls to have ethical constraints – and perhaps ethical ideals – incorporated into business functioning. One promising avenue was to have corporations bound by human rights obligations. To be sure, despite their growth in power and resources, corporations differ greatly from nation states. Almost all commentators accept that the major differences between states and human rights mean that businesses must have a different array of obligations compared to states (e.g., Campbell 2006).

This opens the question of how human rights can be properly incorporated into business activities, perhaps using codes or other instruments of guidance. A baseline position holds that human rights are the primary responsibility of nation states, who are, after all, the signatories of treaties and therefore bound by international law. The moral minimum required of business is to respect the many ways states endeavor to promote human rights. As corporations are not humans, they have no human rights against being regulated for human rights purposes (Sampford 2012). States may implement laws to protect the human rights of both their own citizens and of any people impacted by corporations headquartered within their borders. Key areas of human rights concern on this basis include labor laws, non-discrimination laws, health and safety laws, and environmental laws.

If the minimum standard imposed by human rights is for businesses to respect the legal obligations imposed by rights-respecting governments, beyond this baseline there is a variety of views on the relationship between human rights and ethical business. Two main approaches are noted below, consisting of instruments developed by authoritative institutions to codify business’ human rights requirements, and a more flexible, judgment-based approach.

### Institutionalizing Human Rights and Business: The UN Guiding Principles

Given the indirect and fragile application of international human rights law to businesses, and the governance gaps exposed throughout the 1990s, many attempts were made to improve human rights outcomes by better codifying and institutionalizing human rights requirements for businesses. Even in the absence of black letter law, codifying serves many important processes. It can help settle expectations, clarify duties and priorities, communicate higher standards, and create institutions to facilitate and monitor outcomes (Campbell 2006).

In this context, human rights were invoked as relevant Corporate Social Responsibility (CSR) obligations in major instruments including the *Global Compact* – where human rights make up the first two principles – and the ISO26000 *Guidance on social responsibility* – where human rights appear as both a “core subject” and a “key principle.” However, the *UN Guiding Principles on Human Rights and Business* stands as the most influential codification of human rights duties for business. (The most recent versions of the *Global Compact* and the *OECD Guidelines for Multinational Enterprises* explicitly incorporate the *UN Guiding Principles*.)

The *Guiding Principles* developed out of a lengthy international research and consultancy period. Initially, the draft norms specified only a limited array of human rights to which business needed to attend, but laid down expansive responsibilities with respect to those rights. Over the course of the consultation, however, a different approach gained traction. This approach *widened* the amount of human rights that should be

respected to the full list enumerated in the international bill of rights. At the same time, it *restricted* the types of obligations that businesses must shoulder to implement those rights (Ruggie 2008).

To explain: It is widely accepted in both law and ethical theory that are multiple ways in which an agent, X, can help implement a given human right of another person, Y (e.g., Sampford 2012; Brenkert 2016). (Unfortunately, there is no consensus on terminology for these modes of rights implementation. The terminology employed in what follows is common, but variations abound.) X might *respect* Y's right – by ensuring that X does not personally violate Y's right. X might *defend* Y's right – by preventing others from violating Y's right. X might *facilitate* Y's right – by influencing or helping others to implement Y's right. X might *fulfil* Y's right – by delivering its substance directly to Y. And X might *remedy* Y's right – by compensating Y for having their right violated. States are called upon to implement rights by delivering a “scheme of social arrangements” that strategically employs all of these possibilities (Sampford 2012).

Of course, businesses are not states. With this in mind, the Guiding Principles adopted a tripartite approach to rights implementation, holding that states had the duty to *protect* the right (which included the above-noted obligations of defending, facilitating and fulfilling the right), but that businesses held a duty to *respect* the right. Both shared duties to *remedy* the right.

The fundamental obligation to respect (i.e., not personally violate) human rights was based on social expectations, as well as businesses' apparent willingness to accept this duty. Businesses themselves wanted to say that they would never violate others' human rights, and society expected them to live up to this standard.

While the obligation to respect (rather than to promote or protect) might sound narrow, the *UN Guiding Principles* held that it carried significant requirements (Ruggie 2008). First, it was not a merely “negative” requirement to avoid violating rights. Rather, large institutions needed due diligence, in the form of proactive analysis and risk management, to ensure they had processes that

would empower them to reliably recognize and avoid human rights impacts. Second, the Guidelines held that businesses can rightly be held responsible not only for violations they directly perform but also violations in which they are *complicit*. Close involvement with armed groups or authoritarian governments, or exploitation of modern slavery in supply chains, became core concerns of this approach.

The obligation to provide a remedy in the form of effective grievance mechanisms was held to follow from the obligation to respect. In the course of ensuring they did not violate human rights, businesses had obligations to provide effective mechanisms to have claims against them appropriately heard and judged – even if the domestic law or local courts were not viable options for the protection of rights.

The *Guiding Principles* stands as a powerful example of the attempt to codify human rights obligations for business. It lays down not only the specific rights to which businesses should respond but also details the types of duties (i.e., to respect and to remedy) businesses must shoulder to live up to their responsibilities.

### **Judgment: Human Rights and Flexible, Contextual Obligations**

Codification provides important advantages, giving stability and concrete form to businesses aiming to uphold human rights responsibilities. But it has costs too. Several recent philosophical theories of human rights take the position that – while human rights themselves remain primary and stable – many of the types of duties that can flow from them should be understood flexibly and with attention to context.

It was noted above that human rights can be protected through many modes. While codification through courts and treaty provisions can be important, from the moral point of view what matters is that states respond effectively and fairly to further human rights (Sen 2004; Breakey 2015). States are therefore called upon to use the many policy levers at their disposal – including legislation, executive action, public services, and regulation – to craft a scheme of social arrangements that works to respect, protect, facilitate,

fulfil, and remedy human rights. While some types of duties (e.g., to respect and protect rights) may be fixed and stable over time, overall this scheme may be in perpetual flux, responding to new threats to rights and seizing new opportunities to fulfil them as context determines.

Just as states can and do respond flexibly, so too can ordinary human subjects and the institutions they create – including businesses and corporations. As Amartya Sen (2004) argues:

Human rights generate reasons for action for agents who are in a position to help in the promoting or safeguarding of the underlying freedoms. The induced obligations primarily involve the duty to give reasonable consideration to the reasons for action and their practical implications, taking into account the relevant parameters of the individual case.

On this footing, corporations rightly have responsibilities for human rights, either intrinsically on the basis of their status as (collective) agents or because the human beings that populate them have those responsibilities, which are then mediated through the work of the institutions they create. Some of the ensuing duties will be stable over time – such as the obligations to respect human rights. But other obligations will arise more flexibly, depending on context, capabilities, opportunities, and risks.

As well as its philosophical defenders (Sen 2004; Breakey 2015), this flexible approach is practically embodied in instruments like the UN Global Compact. The Global Compact follows the Guiding Principles in seeing the obligation to respect human rights (including not being complicit in human rights violations) as an absolute baseline requirement. It lists three sets of factors for determining the scope of these obligations: the particular challenges created by the local country context; whether the business is contributing to human rights violations in their capacity as producers, service providers, employers, or neighbors; and, the relationships the business has with other agents who pose risks to human rights. These factors parallel those used in philosophical analyses of human rights obligations (Breakey 2015). Further, the Global Compact also invokes the need to *support* human rights, where

companies can make a positive contribution to human rights, especially in areas that are strategically relevant to their core business activities – such as through providing decent work and producing quality goods or services that improve lives.

## Concluding Remarks

The Global Compact and the UN Guiding Principles are both, like all other international CSR instruments, voluntary initiatives. However, the fact that these codes are *legally voluntary* does not mean their obligations – especially their human rights obligations – are *morally optional* (Campbell 2006). Equally, the fact that some human rights obligations may be flexible and contingent on context does not mean these duties are not mandatory (Sen 2004; Breakey 2015).

Ultimately, the relationship between business and human rights is still evolving. Some aspects of human rights obligations for business are relatively uncontroversial. These include the legal obligation to obey the government's human rights-based laws, the moral obligation to respect (not violate) human rights, and to remedy violations when they occur. For businesses, these are not purely negative duties, but require due diligence and strategic action. Yet there are rights-based reasons for extending obligations beyond these baselines, including widening the sense of complicity at work in rights violations (including supply chains) and expanding the modes of obligation from respect and remedy, to fulfilment and facilitation.

## Business and Peace

Timothy L. Fort  
Department of Business Law & Ethics, Kelley  
School of Business, Indiana University,  
Bloomington, IN, USA

## Introduction

The concept of business and peace focuses on the ways in which business organizations can contribute to peace both through direct action in conflict-sensitive zones and in general business conduct whether or not connected to a conflict-sensitive zone.

## The Concept of Business and Peace

Kant (1795) and Montesquieu (1748) both held that trade had the potential for enhancing peaceful relations. Economists, such as the Nobel Prize recipient F.A. Hayek (1988), made a similar argument in that trade most efficiently depends on trustworthy relationships, where ethical virtues such as truth-telling, promise-keeping, and

delivery of high-quality products and services are practiced. The benefits of trade create incentives for individuals to participate in the same circle of trade most efficiently proceeding on the base of this mix of ethics and trade. Taken to its logical conclusion, Hayek suggested that an expanding circle of trade and the ethical relationships producing optimal trade could produce international peace. The idea that trade contributes to peace has been promoted by government leaders from a variety of perspectives.

The focus on how specific business organizations might impact peace, however, is relatively new. Its origins lie in a book by Jane Nelson, writing for the Business Leaders Forum. In 2000, she published her *The Business of Peace*, (Nelson 2000) which essentially set out business's contribution to peace as a mechanism of strategic corporate social responsibility with a benefit to business itself. A year later, Virginia Haufler, writing for the Carnegie Endowment of International Peace, published *A Public Role for the Private Sector*, (Haufler 2001) which complementarily developed the positive political role that businesses could play in addressing many underlying conditions that could lead to violence, if unattended, but which could benefit constructively through the participation of business organizations.

From an academic standpoint, these starting points provided the foundation for a series of books by Timothy Fort (Fort and Schipani 2003; Fort 2007, 2008, 2015). The general thrust of these books has been that businesses can make three central contributions peace. First, business organizations are the engine for economic development, which creates jobs. Evidence shows that alleviating poverty, engineering technological and managerial transfer, and differentiating an economy away from commodity-based economics are associated with reduction of violence. Second, companies that follow and reinforce rule of law principles and structures such as protection of property and contract rights and dispute resolution forums. Perhaps more importantly, there is a clear correlation between corruption (here, bribery) and violence so that companies adopting strong anti-

bribery policies also make a contribution to peace. Third, to the extent companies create a sense of community in their work, they promote peace. This includes an external dimension through corporate citizenship, and it also includes building an internal corporate community that respects employee voice, gender equity, human rights, and sizes groups to match the optimal neurobiological capabilities; in doing so, one not only provides the environment so that employees recognize the consequences of their actions, but it is also a feature that replicates anthropologically determined attributes of nonviolent societies.

Indeed, this stream of argument links business and peace to the field of business ethics and corporate social responsibilities. If it is true that the above are attributes of nonviolent groups, established empirically through anthropology, political science, and economics, it is also notable that such practices are also those generally recommended by most businesses ethicists. Thus, ethical business conduct – as defined by these peace-building practices rather than by adherence to any particular philosophical or political point of view – has the potential, in a virtuous circle, to build peace.

Multiple special issues of academic journals, such as the *Journal of Business Ethics*, *American Business Law Journal*, *Vanderbilt Journal of Transnational Law*, *Academy of Management Perspectives*, and *Business Horizon*, have all expanded upon these arguments.

Additional scholarship has been generated with respect to specific industries. For example, Natalie Ralph (2015) and Jill Shankleman (2007) have each written books on the possibilities for peacebuilding within the extractive industry. Others focus on the specific responses businesses make in conflict sensitive zones, such as Jennifer Oetzel and Kathleen Getz (2012) and also Angelika Rettberg (2014). Cindy Schipani and Norman Bishara (2010), and Terry Dwokin and Schipani (2002) have examined the impact of gender policies and opportunities, and Gretchen Spreitzer has written about the peacebuilding aspect of voice in the workplace.

Still others focus on a particular geographical area such as John Forrer and John Katsos with

respect to Cyprus. Non-Governmental Organizations (NGOs) have also devoted specific attention to business and peace, such as the United Nations, International Alert, the Institute of Economics and Peace, the Business for Peace Foundation, and Peace Through Commerce. The United States Institute of Peace sponsored a task force studying the topic as well. Related to the governmental role in this area, Jo Ford has written on the essential feature of public policy in establishing parameters for business activity (Ford 2015).

With this growth in the field, scholars increasingly attempt to categorize the emerging segments of this research. One such categorization is among peacemaking, peacekeeping, and peace building.<sup>1</sup> The first two look at the actions of business in conflict-sensitive zones. What can businesses do in order to bring conflicting parties to a negotiating table. This might include direct intervention in meeting with leaders of conflicting sides, as was reportedly the case with respect to General Electric executives and the leaders of Pakistan and India in the late 1990s (Friedman 2002). It could include generalized statements from business encouraging conflicting sides to find ways to make peace, such as occurred in Northern Ireland. The aims of these two aspects of business and peace relate to dampening existing conflict.

Peace building is a more generalized approach where businesses take actions that have been shown to increase the likelihood of constructive relationships with stakeholders. There is much overlap with the fields of business ethics and corporate responsibility though most advocating for this approach steer away from a philanthropically oriented corporate social responsibility strategy.

Another division is among peace entrepreneurs, corporate foreign policy, and unintentional contributions to peace (Fort 2015). Some businesses are social entrepreneurs. They specifically use the business organizational model in order to achieve financial success but also social goals. In some cases, there are corporate chartering models, such as the “B” corporation in the United States,

<sup>1</sup>International Council of Swedish Industry

that makes this social entrepreneurship more secure, but given the fact that all corporations are based on a principal-agent relationship, as long as the shareholders desire noneconomic objectives, the peace entrepreneur could use any business model.

Regardless of that choice, peace entrepreneurs may seek to employ members of opposing groups in a conflict so they have the experience of engaging with the “other” or to run tours to both sides of a conflict, so that tourists can gain an appreciation of each side of a conflict.

Many multinational corporations seek themselves as independent geopolitical actors and thus calculate what is in the corporation’s best interest. This could mean that the company believes that it is benefitted more from violence than peace, but with less than 10% of the world’s gross product in the military-industrial complex, most businesses benefit from peace and stability rather than from violence. Thus, there can be instrumentalist calculations that peace is in a business’s self-interest.

Finally, many (probably most) companies do not see themselves as involved in peace-related activities. They simply are doing their own businesses. Yet, the way they do business can matter. Are they exploiting workers or spoiling the environment? Do they constantly break the law and bribe? As already noted, these factors are associated with violence while their opposites associated with peace. Thus, business engaged in solid ethical conduct makes a contribution toward peace even if they are unaware of it.

## Business and Society

Alex C. Michalos

University of Northern British Columbia, Ottawa, ON, Canada

## Synonyms

Business ethics journal; Journal on business ethics; Journal on social responsibility of business

## Definition/Introduction

This is a brief description of the origins of what is currently the official journal of the International Association of Business and Society.

## Description

The first issue of the *Business and Society (BS)* appeared in September 1960, with 36 pages. This

was also the total number for the first volume. Its basic aim and scope were described by its editor, Richard Thain, in an editorial called “Declaration of Interdependence.” We are told that the aim is “especially to stress the interdependence of business and all other disciplines which contribute to society. We will attempt to examine the total fabric wherein the contributions of the humanities, the sciences and the arts are inextricably interwoven with the concerns of modern management...Business decisions are of such import to the lives of everyone that moral and ethical values are as much concern to businessmen as to philosophers...The articles range from research reports, articles of opinion and essays to literary forms...satire, the short story and the poem are admirable media for the sensitive conveyance of commentary and impression to educated readers.”

The original sponsor of the journal was the College of Business Administration of Roosevelt University in Chicago. The plan was to have a semiannual publication appearing in the fall and spring. The first issue was sent to a select group of potentially interested readers and writers, based on a “carefully built” mailing list of “literate readers from all walks of business and society – people who would be likely to share our concerns.” The price was set at 60 cents per copy, \$2 for a 2-year subscription. Financial contributions to the “magazine” were welcomed and would “receive the tax treatment accorded any educational contribution.”

As of May 2017, there have been 56 volumes produced with various numbers of issues and pages per volume. The publisher is now SAGE. The current volume has five issues making 781 pages. Printed volumes sell at \$150 per volume. The coeditors are listed as Andrew Crane, Irene Henriques, Bryan Husted, and Dirk Matten.

## Business and War

Miguel Alzola

Gabelli School of Business, Fordham University,  
New York, NY, USA

## Synonyms

Corporate Responsibilities; Just War Theory; War Ethics

## Introduction

This entry is about the ethics of war and the ethics of business and how moral justifications about the war and the way a war is waged have an impact on the responsibilities of noncombatants, that is, those who are not direct participants of the war effort, including civilians, business firms, and their executives and employees.

## Business and War

As of December 2022, over one thousand American companies have publicly announced that they are voluntarily curtailing business in Russia amid pressure from consumers to protest Russia’s invasion of Ukraine and beyond what is legally required by international sanctions (See “Over 1,000 Companies Have Curtailed Operations in Russia – But Some Remain,” Chief Executive Leadership Institute, Yale University <https://som.yale.edu/story/2022/over-1000-companies-have-curtailed-operations-russia-some-remain>). Will these efforts force Russia to end the war? Are the companies leaving Russia motivated by moral concerns?

The war in Ukraine has revived interest in the involvement of business corporations in war. Is it

morally permissible to seek and make profits from war? Do business firms have distinctive moral obligations in wartime as opposed to a context of peace?

The traditional view about the morality of war is summarized in Just War Theory, an ethical framework originated in Christian theology that is concerned with the justification of why and how wars are fought. Traditional Just War Theory holds that the responsibility for resorting to war rests on state political authorities and that the responsibility for how the war is waged rests on the state's army. According to that view, business firms and civilians have no special obligations in wartime (Walzer 1977).

The purpose of this entry is to critically examine this traditional understanding of war as a way to reconsider the responsibilities of business firms and executives in armed conflicts.

Building on a revisionist take on Just War Theory, this entry considers the status of the rules of engagement in war. Two claims are defended in the course of this entry. First, the principle of discrimination should be redefined according to the civilian's contributions to posing an unjust threat, the regularity of her behavior, and the intentionality of her acts. Second, the moral obligations of civilians and business corporations are fundamentally altered by the war context. Thus, the standards of liability to defensive attack should embody reasonable expectations about their behavior in wartime.

Despite the fact that war and ethics do not seem to go well together, warfare has been infused with moral concerns from the very beginning, as exemplified in Homer's *Iliad*. War is brutal, and we humans have every reason to consider moral principles that may justify resorting to war and avoiding particular forms of warfare. The "just war tradition" started with Christian thinkers St. Augustine and Thomas Aquinas and has informed a historical body of international rules applied in wars through the years, with the Geneva and Hague conventions as examples of legal limitations to certain forms of warfare.

Just War Theory offers a set of moral principles that work as an ethical framework for waging war. It comprises three distinctive parts. *Jus ad bellum*

concerns the justice of resorting to war in the first place. *Jus in bello* concerns the justice of conduct within war after it has begun. And *jus post bellum* concerns the responsibility and accountability of belligerent parties after the war has finished.

The principles of the justice of war (*jus ad bellum*) are that war should have a just cause, be the last resort, be declared by a proper authority, possess the right intention, have a reasonable chance of success, and have an end that is proportional to the means used. The principles of just conduct within war (*jus in bello*) hold that non-combatants are not permissible targets, that collaterally harming them is permissible only if the harm is proportionate to the goals of the attack, and that collaterally harming noncombatants is permissible only if it is necessary and the least harmful means feasible. Under traditional Just War Theory, these principles are independent of each other.

The central requirement of *jus in bello* is the requirement of discrimination, that is, the principle of civilian immunity. According to the traditional understanding of this principle, combatants ought to discriminate between combatants and noncombatants, intentionally attacking the former but not the latter because noncombatants pose no immediate threat to the soldier (Lazar 2015). This interpretation relies on the assumption that what makes an agent morally liable to defensive force is to pose a threat. Hence, the argument goes, the distinction between legitimate and illegitimate targets coincides with the distinction between combatants and civilians. "Noncombatants" includes civilians and combatants who no longer pose an external threat, such as the naked, wounded, sleepy, or surrendered soldier.

Against that argument, the author has argued elsewhere that posing a threat is neither a necessary nor a sufficient condition for moral liability (Alzola 2011). Not sufficient because there is no right of self-defense against non-responsible threats. A person does not lose her right not to be attacked by posing an unjust threat to another person if she is not morally responsible for that action (Otsuka 1994). Not necessary because a person may be morally liable to defensive force by virtue of being morally responsible for an unjust threat she is not directly posing (Rodin 2004).

What makes someone a legitimate target, what makes someone morally liable to defensive violence, is her moral responsibility for creating or maintaining an unjust threat. That entails breaking the wall between *jus ad bellum* and *jus in bello*: the justice of the war (e.g., a just cause) matters to the assessment of combatants. The Just War Theory's doctrine of the moral equality of soldiers does not hold. It makes sense to distinguish between just and unjust soldiers. Consequently, soldiers should distinguish those morally responsible for an unjust threat that provides a just cause for war from those who are not morally responsible (McMahan 2004). Unjust combatants are then legitimate targets of belligerent actions, but just combatants (and noncombatants) are not.

That creates a different set of obligations for combatants, who can disobey orders to fight an unjust war – unless they are members of a legitimate state acting in good faith (Renzo 2019). But how does this matter for business? How is it relevant to the firm's responsibilities and its executives?

Revising *Just War Theory* along the lines of responsibility has radical implications not only for soldiers but also for civilians. Under this account of moral responsibility, it matters less what uniform one wears and more what contributions one makes to a just (or unjust) war.

One may object that using moral responsibility as the basis for liability to defensive force does not work because moral responsibility comes in degrees, which makes it hard to establish a threshold to determine whether someone is a legitimate target. Nevertheless, this concern is not unique to the criterion of responsibility – and it is even more critical in traditional *Just War Theory* because its criterion of liability is all or nothing.

Admittedly, it may not be easy to obtain accurate information about the noncombatant's responsibility for the unjust threat that her country poses. A person's responsibility for posing an unjust threat can be summarized in her contributions to the war effort, the nature of her behavior, and her intentions.

First, if moral responsibility is a matter of degree, civilians' contributions to the unjust threat should be a standard to establish their war status.

Civilians participate in war as citizens who vote for belligerent political leaders, as taxpayers who fund the war, as journalists who can manipulate public opinion for or against the war, and as politicians who make war decisions. They can also do that in the context of business firms, where employees, managers, and business executives can contribute to the war effort in different ways. The firm itself, as a legal person, can also contribute to war and even influence public opinion by taking a stand on the war and deciding to withdraw or remain in the country pursuing an unjust war.

Civilians working as farmers and workers in munitions factories might perform causally necessary actions to destroy the just combatant. But there may be good reasons to distinguish civilians' liability to defensive force based on the degree of such contributions. Of course, those who provide the unjust combatant the material resources to fight an unjust war contribute to it but so do the civilians who provide food, shelter, protective clothing, and medical care. Traditionally, civilians who provide military resources such as weapons are considered legitimate targets but those who provide food and medical services are not. Still, a physician treating an unjust combatant contributes to prolonging the unjust war and making an unjust threat possible (Kamm 2004). Thus, regardless of whether civilians contribute guns or food to unjust lethal threats, only those whose contributions pass a certain threshold of causal and moral responsibility are liable. What follows is that regardless of how such a threshold is established, revising the traditional view leaves the door open, at least in principle, for regarding some civilians as legitimate targets (Fabre 2009).

A similar distinction can be made to determine corporate responsibilities as professional armies increasingly rely on private military contractors. Considering the type of services they provide and their location in the battle space, a spectrum of business corporations can be identified, ranging from regular commercial firms to military provider firms, military consultant firms, and military support firms. There is a gradient of presumed moral responsibility: the closer the activities of the corporation to the actual fighting, the higher its level of

contribution to the unjust threat and, the higher its degree of moral responsibility for posing an unjust threat and, therefore, the more legitimate its targeting by just combatants (Alzola 2011).

A second standard to determine the civilian's (or the firm's) moral responsibility is the degree of regularity of her behavior. Many civilians whose activities are essential to the war effort continue doing what they would have done in peacetime in their usual occupations (e.g., farmers, employees in the public sector, members of fire brigades, and priests). Since they are doing so little different from their peacetime occupations, even if their services are essential to the well-being and even the survival of combatants, they are not as legitimate targets as civilians who give shelter to unjust combatants or offer themselves as voluntary shields. Moreover, while the farmer, the doctor, and the priest are helping the soldier *qua* human being, the voluntary shield is helping the soldier in his capacity as a fighting man. The enemy is not the unjust soldier as a human being but as a soldier. In sum, a civilian who makes a material contribution to the war effort by acting in the same way he would be doing if the war were not in progress is less liable to defensive force than someone acting in a radically different way as a result of the ongoing war (Alzola 2011).

But contribution and behavioral regularity are not the only criteria for moral responsibility. A research scientist makes a discovery that contributes to developing new injurious weapons. A televangelist uses his TV program to promote the assassination of a foreign political leader. A newspaper agitates in favor of an unjust war by publishing false information. Although these civilians make a small causal contribution to the unjust threat, and their acts may be performed in the ordinary course of their occupations, they are more responsible if they intend to do so than other civilians who intend to keep themselves neutral or disassociate themselves from an unjust threat. Intentions make the difference in the permissibility of the civilian's actions.

Similarly, business firms are said to develop intentions on their own, presumably instrumental to achieving their goals. Arguably, the purpose of

business firms is evolving from a shareholder to a stakeholder orientation. However, corporate goals are grounded on the implicit assumption of relative peace and legitimate political institutions. What is the purpose of business in a different historical context? Is war a game for businesses to play for profits? Companies are invoking moral reasons to exit from Russia (See McDonald's announcement that it would exit the Russian market here: <https://www.sec.gov/Archives/edgar/data/63908/00006390822000020/exhibit991-05162022.htm>). Does the war context change corporate purpose even to the point of requiring withdrawing from (or remaining in) aggressor states and imposing the losses on the firm's shareholders?

Corporate participation in war must have a higher moral and political justification than economic profit. And corporate decisions to participate and profit from war – even for a just cause – carry moral and legal responsibilities (Orts 2002).

Consider I.G. Farben (Interessen-Gemeinschaft Farbenindustrie AG), a German conglomerate of companies formed in 1925, which held a monopoly on chemical production later during the time of Nazi Germany. I.G. Farben held the patent for the pesticide Zyklon B, which was manufactured by a company owned by I.G. Farben and was used in the gas chambers for mass murder. Eventually, 24 directors of I.G. Farben were indicted in the so-called I.G. Farben Trial before a U.S. military tribunal at the Subsequent Nuremberg Trials. Thirteen directors were sentenced to prison terms, and the company was considered too corrupt to continue to exist. The company was officially liquidated in 1952, but it continued to be traded on the German stock exchange until it was declared bankrupt in 2003 by its liquidators.

However, these are *jus post bellum* considerations after the war has finished. Can business firms and their executives be legitimate targets *in bello* for imposing an unjust threat? This chapter has explained why the notion of "combatant" does not properly comprise sufficient moral conditions for being a legitimate target of defensive force. If the principle of responsibility provides the moral basis of liability, besides being a guide to the combatant's individual conscience, it has crucial

implications for civilian (and business) responsibilities in wartime. To reiterate, noncombatants who bear significant responsibility for initiating or sustaining an unjust war might be responsible to a greater degree than combatants and, therefore, become legitimate targets.

*Harsh Times*, Vargas Llosa's most recent book, opens with the story of "the two most influential people in Guatemala's history and Central America's destiny in the twentieth century" due to their role in the 1954 coup d'état (2019: 15) Samuel Zemurray, nicknamed "Sam the Banana Man," was an American businessman who made his fortune in the banana trade as founder and president of the United Fruit Company, the world's most influential fruit company at the time. Edward Bernays was the public relations director of United Fruit. High-ranking officials in the Eisenhower administration had close ties to the company. Secretary of State John Foster Dulles had worked for United Fruit's U.S. law firm, and his brother, CIA director Alan Dulles, sat on its board. The company owned 42% of Guatemala's land in the 1950s but had never paid a cent in taxes. Juan José Arévalo, Guatemala's first democratically elected president in 1945, wanted to make Guatemala a democracy like the USA's, the country he admired and had as a model. He had an ambitious electoral and education reform plan whose entire point "was to prevent poverty, injustice and social inequality from pushing Guatemalans towards communism." The president's plan would require multinationals to start paying taxes. Bernays had reported that "the danger that Guatemala should turn communist . . . is remote." Still, in order to protect United Fruit profits and avoid paying taxes, Bernays argued they needed to invent something – a "grave, immediate threat." "What threat? The very same one that I have just told you Guatemala does not represent: the Soviet Trojan horse sneaking through the USA's back door" (2019: 25). That is how a lie (the false accusation of communism) was taken as true to begin the 1954 CIA-backed military coup against a democratically elected Guatemalan president.

Whether or not the 1954 Guatemalan coup d'état started precisely like this, historians agree

that United Fruit and its executives set in motion the events that brought civil war to that country and disrupted the whole continent. It is certainly a case of an unjust war.

According to the principle of responsibility, it might be plausible to presume that Zemurray, Bernays, the Dulles, and the likes bore at least a significant degree of responsibility for the killing of thousands of just combatants and innocent civilians and the violation of national self-determination. It follows that Bernays, Dulles, and other executives involved in the decision would be legitimate targets for defensive force by just combatants. In other words, if attacking these business executives had been as effective as attacking soldiers in preventing the coup, it would have been permissible to attack them. Indeed, such an outcome would have been preferable to attacking combatants if that meant fewer people had to be killed (McMahan 2004).

In any event, the use of lethal force against these executives had ultimately been impermissible if the other constraints of *jus in bello* – namely, proportionality, necessity, and minimal force – were not fulfilled. And if responsibility is a matter of degree, some degrees of moral responsibility may not be significant bases for liability to defensive force (Alzola 2011). Ultimately, liability in war is not always a liability to intentional military attack.

## Business Case for Business Ethics

Alex C. Michalos  
University of Northern British Columbia, Ottawa,  
ON, Canada

### Synonyms

Ancient views on ethics in business; Argument for social responsibility in business; Argument for business ethics; Cicero on the business case for business ethics; Machiavelli on a variation of the business case for business ethics

### Definition

This is an account of the business case for business ethics from Cicero to 2017.

### Description

The business case for business ethics is the thesis that morally good behavior in business is materially good for business. Michalos (1995) called this the “single worst argument” for business ethics. It is, nevertheless, a frequently asserted

argument by businesspeople and academics alike. Mahoney (1992) noticed that “in 1988 the US Business Roundtable issued a report on corporate behavior with the enticing title, *Corporate Ethics: A Prime Business Asset*.”

While the argument is familiar to many contemporary scholars and practitioners, and there is something to be said for it, it is defective and dangerous to use in support of morally good or socially responsible business practice. What can be said for it is just this. Sometimes, the display of morally good behavior in business will be perceived as such, praised, and rewarded by beneficiaries and uninvolved observers. As well, perceived morally bad behavior is often punished in ways that not only destroy perpetrators’ reputations but also the material interests of their businesses. If the behavior violates civil or criminal laws, perpetrators may be prosecuted and their businesses totally destroyed.

Granting the obvious, as just described, Marcus Tullius Cicero (106–143 BCE) was perhaps the first western philosopher/statesman to challenge the argument in writing. In his essay “On Ends,” he wrote:

In friendship some profess that the Wise Man will hold his friends’ interests as dear as his own, while others say that a man’s own interests must necessarily be dearer to him; at the same time the latter admit that to enrich oneself by another’s loss is an action repugnant to that justice toward which we seem to possess a natural propensity. But the school that I am discussing [i.e., Stoicism] emphatically rejects the view that we adopt or approve either justice or friendship for the sake of their utility. For if it were so, the same claims of utility would be able to undermine and overthrow them. In fact the very existence of both justice and friendship will be impossible if they are not desired for their own sake. (Cicero 1931, p. 291).

In short, Cicero clearly saw that if morally right actions are finally only warranted by their financial profitability, then they could be undermined and overridden by immoral actions whenever the latter promised greater profitability, a consequence that would effectively destroy the institution of morality. So, morally right or good actions can only be properly performed for their own sake.

About 1500 years after Cicero, Niccolo Machiavelli (1469–1527) recommended behavior to aspiring princes that is a variation on the theme of the business case for business ethics. This is what he wrote:

A prince . . . ought to take great care that nothing goes out of his mouth which is not full of the five qualities . . . all pity, all faith, all integrity, all humanity, and all religion. Nothing is more necessary than to have this last quality. For men, universally, judge more by the eyes than by the hands . . . Everyone sees what you seem to be, but few touch what you are . . . And with respect to human actions, and especially of those of princes where there is no judge to whom to appeal, one looks to the end. Let a prince then win and maintain the state – the means will always be judged honorable and will be praised by everyone; for the vulgar are always taken in by the appearance and the outcome of a thing, and in this world there is no one but the vulgar. (Machiavelli 1980, p. 109.)

For Machiavelli, whose name translates roughly as “hard nails,” the success of a prince is more the result of appearing morally good than of being morally good. The two necessary conditions for success are to appear morally good and to maintain the state. If he had been addressing an aspiring businessperson, he might have said that the two necessary conditions for success are to appear morally good and make a profit. Then, since asserting the business case for business ethics gives one the appearance of moral rectitude, the aspirant should assert the case. Merely asserting the business case for business ethics is materially good for business. Whatever else one does will be ignored, so long as there is a profit over some reasonable length of time. “Where there is no judge to whom to appeal, one looks to the end.”

While there may well be some personal and/or corporate material payoffs to be made from asserting the business case for business ethics, such payoffs should be regarded as serious threats to individuals’ understanding of and action consistent with moral virtue, as well as threats to the very institution of morality. Whatever business case there is for business ethics itself or for the assertion of the business case for business ethics, such business cases are not moral arguments and

are no more morally praiseworthy than the business cases for selling any other product from automobiles to zippers.

(This article is adapted from Michalos 1995, 2008, 2013.)

## Business Code of Ethics

Muel Kaptein

Business Ethics and Integrity Management,  
Rotterdam School of Management, Erasmus  
University, Rotterdam, The Netherlands

## Synonyms

Business code; Business principles; Code of conduct; Code of ethics; Code of integrity; Code of practice; Credo; Declaration; Deontological code; Philosophy; Policy principles; Standards; Values statement

## Definition

A business code of ethics (BCE) is a distinct and formal document containing a set of prescriptions on a range of issues, which has been developed by and for a company for the purpose of guiding its employees' behavior toward each other, the company, external stakeholders, and/or society in general. A BCE is a device for self-regulation developed for and by a particular company. A BCE is one of the layers in the whole spectrum of codes for businesses that consists, among others, of professional, industry, national and international codes.

## Adoption

In the business ethics literature, a BCE is the most frequently cited instrument for managing the ethics of business. Nowadays, many companies have a BCE. For example, 76% of the Fortune Global 200 companies have a BCE (KPMG 2014).

## Content

BCEs range from a single page up to 80 pages and their content also differs. One-fifth of the codes of Fortune Global 200 companies describe the organization's mission and/or vision, and 43% describe the organization's core values. The most cited of these values are integrity (50%), respect (36%), honesty (34%), responsibility (27%), and trust (26%). In almost all these codes (95%), the company describes its responsibilities toward its employees. A company's responsibilities toward society, natural environment, competitors, and customers are described in 79%, 70%, 53%, and 52%, respectively, of the Fortune Global 200 codes. The most common standards and rules apply to confidential or secret information (93%), corruption and bribery (91%), accuracy of reporting (90%), protecting the organization's assets (90%), accepting gifts (84%), and performing side-line activities (83%).

## Functions

A BCE fulfills a diverse range of internal and external functions. The internal functions with regard to employees include:

- An *orientational function*. A BCE sharpens awareness of the company's mission, the relevant values, responsibilities, standards and rules, and it confronts employees who have old bad habits. Apart from its content, the code's presence is itself a significant signal of the importance of ethics for employees.
- A *clarifying function*. A BCE provides clarity about the ethic that ought to prevail. A BCE illuminates and explains. It draws boundaries, sets down the rules of the game, and makes explicit what should and should not be done.
- A *guiding function*. A BCE formulates the company's expectations toward employees and provides guidance. After all, the objective of a BCE is to direct the conduct of employees.
- A *stimulating function*. A BCE stimulates the engagement and loyalty of employees by appealing to their sense of responsibility and inspires them to commit themselves to the ethics of the company.
- An *initiating function*. A BCE stimulates activities aimed at improving the ethics of the company. The code acts as a tool for detecting and addressing gaps and deviations.
- An *internal corrective function*. A BCE creates checks and balances. Employees can call each other into account regarding compliance with the code. A BCE creates a common ground, a vocabulary, and a framework for holding discussions and provides a basis for social correction.

A BCE can also have the following external functions:

- A *distinguishing function*. A BCE enlarges the recognizability of the company to the outside world: it makes known what the company stands for.
- A *legitimizing function*. A BCE clarifies what a company would and would not do and what

guides it. A BCE can therefore enhance stakeholder's trust in a company.

- An *external corrective* function. A BCE creates checks and balances. Stakeholders can monitor a company's compliance with the code and confront the company with its own code when there is inconsistency with the behavior of its employees.

## Effectiveness

A review of 79 empirical studies by Kaptein and Schwartz (2008) shows that the empirical findings on the effectiveness of BCEs are divergent: 35% of the studies found that BCEs are effective, 16% found that the relationship is weak, 33% found that there is no significant relationship, and 14% yielded mixed results. One study even found that BCEs could be counterproductive. These mixed findings can be attributed to the fact that the mere existence of BCEs does not necessarily amount to its effectiveness. As Cooper (1990: 8) notes: "A code of ethics cannot make people or companies ethical. But nor can hammers and saws produce furniture. In both cases, they are necessary tools, which need intelligent design and use." A code is nothing, coding is everything.

A study by Kaptein (2011) among US working population indeed shows that a code alone is hardly effective but that its effectiveness depends on the content of the code, on the quality of the communication activities, and on how embedded the code is in the organization through its senior and local management. When these factors are present, the frequency of unethical behavior in the workplace substantially reduces.

Business ethics; Professional ethics

## Introduction

Business ethics and corporate social responsibility were conspicuous in their absence in South Africa prior to the first democratically elected government in the country in 1994. Since then they have developed rapidly. In the case of Business Ethics

this has been most evident in its development as an academically respected area of teaching research. Corporate social responsibility has been subsumed as an academic focal area under the main discipline of Business Ethics, and as a widely implemented practice in progressive business organizations in South Africa.

## Business Ethics in South Africa

Business ethics in South Africa prior to the establishment of the first democratic government and the demise of the apartheid state was virtually nonexistent in any meaningful way. Businesses were run and structured in a fully segregated and discriminatory manner, and jobs of certain kinds were the exclusive preserve of Whites, underwritten by prevailing law. As the economic sanctions' noose tightened in the late 1980s and early 1990s, South African businesses were forced to find illicit means to try ensure their enterprises remained economically solvent. Such actions involved sanction-busting maneuvers which incorporated illicit business behavior that took various forms. Much of this sanction-busting behavior could be regarded as unethical since it supported, directly or indirectly, the continuation of the morally untenable apartheid regime. However, the methods used by organizations involved in the war against apartheid also incorporated business practices that in themselves could be regarded as immoral but were justified ethically as relatively minor immoral means to achieve a greater moral end (Rossouw 2016).

Since 1995 business ethics has gained momentum in South Africa and has taken a central position in recent anti-discriminatory labor legislation and attempts to redress the balance of unequal employment opportunities by initiating legislatively backed processes such as affirmative action and Black Economic Empowerment. Today in South Africa, as Rossouw (1997:1539) puts it: "Business ethics has become part of the South African vocabulary both on a practical and a theoretical level. The need for business ethics has been expressed by politicians, business leaders, and academics. The president of

South Africa, Nelson Mandela, for example, said at the opening of Parliament (February 17, 1995): 'We are conscious of the reality that corruption in many forms has deeply infected the fibre of our society. Precisely because we face the challenge of dealing with systematic corruption, we need a dispassionate and systematic approach to this question.'

Recently and especially in the last 5 years (2009–2016), business ethics as an academic discipline has begun to take a strong hold in the curricula of business schools and universities throughout South Africa. Apart from teaching and learning aspects, South African universities have initiated ethics committees tasked with the responsibility of ensuring that high standards of ethical practice are maintained in science, social science, and humanities research practices. The emphasis in the teaching curricula of these institutions has been to try to engender knowledge of ethical responsibilities in business and cultivate a new fresh moral perspective in future business leaders in a country that has an unenviably high international ranking for corruption. Teaching of business ethics at South African universities and business schools sometimes comprises separate, stand-alone modules or as integrated aspects of particular business science disciplines. Such business ethics modules are sometimes positioned as compulsory modules or as electives in particular degree curricula.

Although tentative and perhaps temporary, there is recent evidence that perceptions of corruption in South Africa have improved. South Africa has moved up six places in an international ranking index (the Corruption Perception Index, CPI), suggesting that such combined efforts may have been fruitful, although South Africa is still ranked a lowly 61st place on the Transparency International (2015) achieving a score of 44/100 (with 0 being a most corrupt perception and 100 a perception of the highest propriety).

The general upward trend in business ethics' profile has resulted in a number of specialist institutes and media for its propagation. The Ethics Institute which is a nonprofit, public benefit organization was incorporated in September 1999 and

made up with a board of ten directors, mostly Afrikaans academics (6/10) and in addition two Black, one Indian, and one White businessmen serving as board members. The University of Johannesburg (erstwhile the Randse Afrikaanse Universiteit) also has initiated a journal, the *African Journal of Business Ethics*, specifically aimed for the communication of scholarly research in the field of business ethics in South Africa and Africa as a whole.

### Corporate Social Responsibility in South Africa

Although the Companies Act 61 of 1973 had evolved over the years, changes in societal and international expectations required upgrading to recognize the new business-friendly approach that encouraged entrepreneurship and the need to incorporate new concepts, such as stakeholder rights and corporate governance. This led to the Companies Act of 2008 and more recently the Companies Amendment Bill of 2011. These Acts tended to put more emphasis on corporate responsibilities but are not adequate in their scope to provide enforcement of specific corporate governance requirements for the new democratic South Africa. However, nonlegislative corporate governance guidelines have been developed over the years in South Africa which have gained increasing currency in South Africa and overseas and have taken the form of four regularly updated reports known as the King Reports.

In 1994 the first corporate governance report in South Africa was published which later became known as the King Report on Corporate Governance. Although the report was not underwritten by legislation, it promoted an ethical ethos and an injunction that company boards of directors should be responsible to all stakeholders and not simply shareholders.

A second King Report on Corporate Governance was published in 2002. This report extended the stakeholder approach further by incorporating what became known as the “triple bottom line” consisting of economic, social, and environmental aspects of doing business in

particular companies. Despite a lack of legal enforcement of King II governance recommendations, they have been generally accepted by South African business and widely implemented.

A King III report was made public in 2010 which in contrast to King I and II aims at governance recommendations for *all entities* regardless of the type of corporation or establishment. In King III it is recommended that all entities indicate which principles or practices they have decided not to apply or explain thus potentially allowing all stakeholders to challenge the board on particular omissions and thereby improve corporate governance in that entity.

The focus of King III is on the importance of an entity reporting annually on the ways in which the entity has positively or negatively affected the life of the community in which it operated in the specific year of review. It also enjoins the entity to disclose how it intends to augment the positive aspects and diminish the negative ones in the year ahead.

A report by the consultancy group Price Waterhouse and Cooper (2016, online) indicates that King III incorporates the following key dimensions:

- The need for an annual integrated report that focuses on the impact of the organization in the economic, environmental, and social spheres
- A statement by the audit committee to the board and shareholders on the effectiveness of internal financial controls to be included in the integrated report
- The consideration of the strategic role of IT and its importance from a governance perspective
- The positioning of internal audit as a strategic function that conducts a risk-based internal audit and provides a written assessment of the company’s system of internal control, including internal financial controls
- The governance of risk through formal risk management processes

Most recently a draft King IV report (2016) has been drawn up. King IV focuses on:

- Ethical leadership
- The company’s responsibility and function in society

- Corporate citizenship
- Sustainable development
- Stakeholder inclusiveness and participation
- Integrated reporting and thinking

Deloitte (2016) indicates that there are three fundamental paradigm shifts in corporate governance: from financial capitalism to inclusive capitalism, from short termism to long-term sustainability, and from silo reporting to integrated reporting. Deloitte (2016) indicates that:

Although the role of ethical leadership was recognised in King III, King IV brings a more refined focus in terms of the obligation of the organisation (to be accountable and transparent) as well as the accountability of the company as broader stakeholder within the broader society.

The King reports on corporate governance have been widely accepted by the international community as among the most forward-thinking and best thought-through documents for the general ethical guidance of businesses in both internal company practices and external interface with the community, society, and the environment.

## Business Ethics and Sexual Harassment

Heather M. Clarke

Austin E. Cofrin School of Business, University of Wisconsin – Green Bay, Green Bay, WI, USA

## Synonyms

Ethics and workplace sexual harassment

## Introduction

Notwithstanding the progress made in business ethics over the past several decades, discrimination, inequality, and unsafe work environments persist (Brenkert 2019). A jarring exemplar is workplace sexual harassment, as exemplified by the explosion of harassment allegations in the media as a result of the #metoo movement. The persistence of sexual harassment in the workplace is due, at least in part, to organizational mismanagement of the phenomenon, which is in turn based on inadequate law. The makers of both public and organizational policy have ignored a sizeable body of scientific knowledge on the causes and effects of workplace sexual harassment, allowing the continuance of conditions that foster sexual harassment and discourage reporting.

Keyton and Rhodes (1997) noted the paucity of scholarly work on business ethics and sexual harassment. Almost two and a half decades later, and despite the continuing pervasiveness of sexual harassment in workplaces, this has not changed. In fact, since the 1990s, published scholarship on sexual harassment and business ethics is almost nonexistent. Largely, the work in this area examines sexual harassment through morality-based ethical lenses as alternatives to the law-based approach found in organizations. However, extant literature is devoid of guidance that can lead to the ethical management of sexual harassment in organizations.

## Legal-Centric Management of Workplace Sexual Harassment

Management of workplace sexual harassment is consistent across organizations, and comprises anti-harassment policies, reporting mechanisms, and sexual harassment training (Clarke 2020). These efforts are not intended to prevent sexual harassment, as misconceived by some ethics scholars (see, e.g., White 1998), but only to defend against legal claims (Clarke 2020; Keyton and Rhodes 1997). This legal-centric approach is typical in human resource management (Roehling and Wright 2006).

Research has demonstrated that anti-harassment policies have no impact on incident rates, reporting mechanisms do not encourage filing complaints, and sexual harassment training has no effect on attitudes toward, or even the correct identification of, sexual harassment (for a summary of this research, see Clarke 2020). Yet these three elements are the extent of organizational efforts to address workplace sexual harassment, and they are adopted solely for legal reasons. Courts will consider these elements as evidence that an employer exercised due diligence in preventing harassment, which is a defense against claims of hostile work environment sexual harassment. Thus, although sexual harassment policies, procedures, and training do not actually prevent harassment, they can be enough to establish due diligence in preventing harassment. An employer can also successfully defend a claim if a sexual harassment target failed to report the harassment through the formal reporting mechanism. However, there are many reasons targets do not report including, but not limited to, retaliation, social punishment, and not being taken seriously. Hence, an organizational climate that is tolerant of sexual harassment simultaneously gives rise to incidents of harassment, inhibits reporting those incidents, and provides a defense to legal claims.

This legal-centric management approach has fostered a collective willful blindness to the realities of workplace sexual harassment. It has permitted organizations to claim compliance with the

law without taking any responsibility to actually prevent harassment. Notwithstanding that men are also sexually harassed (although heterosexual men are harassed at much lower rates than men who are sexual minorities), women are far more likely to be harassed and men are far more likely to be harassers (Clarke 2018). Given that upper leadership decides what gets attention in an organization, and upper leadership is male dominated, it is unsurprising that preventing sexual harassment is not a priority for organizations. As long as organizational policies and practices are based solely on the law, management of sexual harassment will never be ethical because the law on which it is based is itself unethical.

## Public Policy on Workplace Sexual Harassment

Codes of ethics are frequently a restatement of the law (Keyton and Rhodes 1997), as is the case with sexual harassment. Irvine (2000) argued that sexual harassment should not be considered unethical because it is illegal sex discrimination. In fact, he asserted that sexual harassment should not be considered a form of sex discrimination since men are also sexually harassed. Irvine (2000) stated “it is obviously impossible to discriminate against a group if you are not treating it differently from other groups” (p. 356). Setting aside the facts that women are harassed far more frequently and experience sociosexual behaviors differently, Irvine completely miscomprehends discrimination law. The law of discrimination does not require, and has never required, that every member of a protected group must be treated differently than every member of the advantaged group. Discrimination is, and has always been, treating an *individual* differently on the basis of a prohibited ground. Because sexual harassment is treating an individual differently on the basis of their gender, it is illegal sex discrimination. Still, the ethics of sexual harassment cannot be based on the law because the law itself is inadequate.

Public policy on occupational safety and health is two-pronged: compensation and prevention. Workers' compensation law is reactive and compensates employees for work-related injuries and illnesses. Occupational safety and health law is proactive and aims to prevent injuries and illnesses through safety standards and a general duty of employers to maintain a workplace free from recognizable hazards. With respect to workplace sexual harassment, however, the law seeks only to compensate after the harm has occurred, if a claim is successful. A target can seek redress, most commonly through discrimination legislation, after experiencing harassment and its damaging effects. No legal obligations exist with respect to preventing and abating the conditions that give rise to the harm. There are no OSHA standards pertaining to sexual harassment and the employer's general duty applies only to physical hazards likely to cause death or serious physical harm.

Even the impotent trifecta of management policies discussed above is rarely mandated. Only a handful of states require sexual harassment policies or training. At the federal level, they are recommended by the Equal Employment Opportunity Commission (EEOC), but not required. This is so despite a substantial body of research identifying predictors, including organizational conditions, which foster sexual harassment (e.g., Willness et al. 2007). Since public policy represents the conscience and values of the people, these laws, enacted by male-dominated governments, suggest that physical safety is more important than psychosocial safety and dignity.

Because governments failed to require employers to prevent harassment in their organizations, the onus fell upon the judiciary to provide greater protection, but it too failed to do so. In hostile work environment cases, a male-dominated judiciary determines whether the harassment was severe enough or pervasive enough to merit compensation. Since men and women do not experience sociosexual behaviors the same way, it is unlikely that a male judge can take the perspective of a female target (Clarke 2018, 2020). This is evident in court decisions

adopting the "boys will be boys" attitude by excusing "boorish" behavior and requiring women to take resistance training (Clarke 2020). The lack of perspective-taking is further evidenced in the denial of claims where targets do not strictly follow formal reporting procedures, thereby shifting the responsibility away from both the harasser and the organization to the target. The message sent is that those who are targeted have an obligation to report it, despite the risk of retaliation, ostracism, and humiliation. Whereas the message that should be sent is that the harassment should not have occurred in the first place.

If workplace sexual harassment is to be eradicated, it will be through the ethical policies and practices of organizations but as long as management of sexual harassment is based on inadequate, reactive law, it will never be ethical. Some scholars have stated that there are two sources of business ethics: the law and morality (e.g., Wells and Kracher 1993) and have thus proposed morality-based approaches as alternatives to the legal-centric approach.

### **Morality-Based Ethics and Sexual Harassment**

Workplace sexual harassment has been examined from morality perspectives, both deontological and teleological. Through a deontological lens, sexual harassment is unethical because it is morally repugnant *per se*; the act itself is impugned regardless of its outcomes. The challenge with this approach is that it requires consensus. There must be consensus that sociosexual behaviors in the workplace are sexual harassment, wrongful, and should be sanctioned. Yet such consensus does not exist. A striking example of this lack of consensus is found in the literature on gender differences in perceptions of sexual harassment (Clarke 2018). In comparison to men, women perceive a wider range of behaviors to be harassment, they perceive sociosexual behaviors as more threatening, and are more likely to experience them as discrimination.

In an attempt to find a path toward consensus, Wells and Kracher (1993) argued that an ethical approach to sexual harassment requires not only that the harasser takes the perspective of the target but also that the target takes the perspective of their harasser. They claimed that the target “must allow some sexual behavior that she finds merely annoying for the sake of the person with a more highly sexual orientation” (p. 428). This assertion is based on a number of fallacious assumptions. The first is that harassers are capable of taking the perspective of targets; research suggests otherwise (Clarke 2018). The second faulty premise is that sexual behavior in the workplace is normal and unavoidable. Booker (1998) echoes this sentiment by asserting that zero tolerance sexual harassment policies prohibit social conversation between men and women, necessarily implying that men cannot have social conversation with women that is devoid of sexual content. Third, Wells and Kracher incorrectly assume that sexual harassment is always about sex, which is inconsistent with theory and research. Sexual harassment is often not about sex but about the desire to assert power over another to put them in their place (e.g., Berdahl 2007) and maintain social dominance (Clarke 2020). The fourth baseless assumption is that women who complain about sexual harassment are frigid and have low sex drives. Not only does this promote victim blaming, by suggesting that complainants are hypersensitive or overly dramatic, it also equates being a sexual woman with being a sexual object, subjugated to men in the workplace.

Even if one accepts that some level of sexual harassment must be tolerated, it does not avoid the consensus problem, as there must be agreement as to which sociosexual behaviors are minimal enough to be merely annoying rather than degrading or threatening. Given gender differences in the experience of sociosexual behaviors, it is unlikely that consensus could ever be reached as to whether or which sexual behaviors in the workplace are normal or harassment. Further, it is unlikely that this qualification would be attached to other forms of discrimination. For instance, it is doubtful that a deontological perspective would

require that some amount of racism be tolerated in the workplace. To require the consensus of those who are not harassed, even of those who are harassers, suggests that the respect, dignity, and well-being of targets are not sufficiently important. Since women are most commonly the targets, it suggests that actions that infringe upon the respect, dignity, and well-being of women are not immoral unless men agree that they are. Hence, a deontological ethics approach is unlikely to be more effective in guiding the management of sexual harassment than the extant legal-centric approach.

A teleological approach, that an act is unethical not because it is inherently wrong but because of its consequences, may avoid the need for consensus. From this perspective, sexual harassment is impugned because of its negative effects. Indeed, research has demonstrated the negative physical, psychological, and job-related effects of harassment (e.g., Willness et al. 2007). Keyton and Rhodes (1997) argue that sexual harassment is an ethical issue, not because it is illegal, but “primarily because it harms others” (p. 132). Similarly, White (1998) proposed that sexual harassment should be examined not from a deontological morality of justice or rights approach, but from a teleological ethics of care or responsibility. The reasoning is that the model of ethics that women employ is more heavily based on emotions and care for others, while men’s is more oriented toward equality and fairness, thus the former should be applied to the ethics of managing sexual harassment. However, this is not congruent with the conceptualization of sexual harassment as an abuse of power or the research findings that women but not men experience perceptions of injustice following exposure to harassment (Clarke et al. 2016). For women, sexual harassment is unequal treatment in the workplace and a reminder that they are not valued in the same manner as their male counterparts. Thus, a teleological examination must acknowledge not only the threatening nature of sexual harassment but also its unjust, discriminatory nature.

## Conclusion

The legal-centric approach to managing sexual harassment, comprised of the trifecta of anti-harassment policies, reporting mechanics, and training, demonstrates a lack of concern for the respect and well-being of all employees. However, due to the lack of perspective-taking, the consensus required to support a deontological basis for the ethics of sexual harassment is likely unattainable. Teleological ethics appears to be the most conducive to managing workplace sexual harassment. Sexual harassment is unethical because of the harm it causes: the derogation of the equality and dignity of women in the workplace. It is irrelevant that men do not experience it in the same manner; consensus is not required.

Through its failure to legally mandate efforts to prevent harassment in the workplace, male-dominated governments have failed to recognize the destructive nature of this phenomenon, as has a male-dominated judiciary through carving out generous legal defenses for employers. Adopting a legal-centric approach to managing sexual harassment, male-dominated organizational leadership has chosen not to give it sufficient attention or to make the prevention of harassment an organizational concern. Thus, the onus passed to business ethics scholars to call attention to these failures and to provide a path toward ethical management. In order to do so, business ethics scholars must obtain a better understanding of the law, the legal-centric approach to managing sexual harassment, and the experience of sexual harassment.

## Business Ethics as an Academic Discipline

Deborah C. Poff

Brandon University, Ottawa, ON, Canada

## Synonyms

Applied Ethics; Corporate Social Responsibility in Business; Professional Ethics

## Introduction

Business Ethics is an applied field of research and a subject of university teaching that is

disciplinary, as well as, multidisciplinary and interdisciplinary in nature. Although some people would place the beginning of Business Ethics as a field with Bowen's 1953 text which posed the question of what is a reasonable expectation for businessmen to society, business ethics more systematically emerged as an academic discipline in the 1970s and 1980s. Business Ethics was one of a number of primarily interdisciplinary academic fields which emerged partially from political community-based action in the 1960s and 1970s. Based on concern from community activists about practices in a number of professional fields and with respect to government policies and practices in many parts of the world, the 1960s and 1970s were a time of change and protest in many nations.

Many of the academic disciplines that developed during this period were interdisciplinary in nature and focused on ethical issues. These include: Afro-American Studies; Women's Studies; Bio-Medical and Healthcare Ethics; Latin American Studies; Environmental Studies, and a number of other fields related to responses to social justice issues and human rights. Women started mobilizing to respond to inequalities in salaries and working conditions; reproductive rights and disparities in roles, and responsibility within the family, for example. Issues related to race, ethnicity, and human rights also emerged. Post-colonial studies focused on the impact of colonization on nations from Imperialist countries, such as, the United Kingdom, Portugal, Spain, and France and the impact and complexity of colonized nation states engaging in decolonization and evolutions to autonomous statehood. The globalization of capitalism was increasing rapidly and having far-reaching and complex impacts on many parts of the world, including issues related to labor and human rights as well as concern for the environmental impacts of the growth of industry. Part of the questions which individuals and groups were raising specifically raised ethical concerns which, in turn, were part of the rationale, which led to the establishment of a number of new scholarly fields which are generally conceptualized as applied ethics. Applied ethics is a cluster of scholarly subjects, which are broadly concerned with particular issues

within business, many professions, and with respect to the public policy of governments. Bioethics, Environmental Ethics, and Business Ethics were just three of the scholarly fields that are now standard curriculum in university teaching and research.

At the same time, more and more scholars began to write specifically on the relationship between business and society and business and social responsibility. This will be discussed further in this entry with the exposition of the emergence of the contemporary study of business ethics as an academic discipline.

Rittel and Webber (1973) writing of the changing context of new studies, in their case with respect to planning, coined the phrase "wicked problems" to identify the complexity of some types of disciplinary issues. In many ways, business ethics is a perfect candidate to describe as involving wicked problems.

Briefly, Rittel and Webber describe wicked problems as having the following ten attributes:

1. "There is no definitive formulation of a wicked problem."
2. "There is no stopping rule."
3. "Solutions to wicked problems are not true-or-false, but good-or-bad."
4. "There is no immediate and no ultimate test of a solution to a wicked problem."
5. "Every solution to a wicked problem is a 'one-shot operation'; because there is no opportunity to learn by trial-and-error, every attempt counts significantly."
6. "Wicked problems do not have an enumerable (or an exhaustively describable) set of potential solutions, nor is there a well-described set of permissible operations that may be incorporated into the plan."
7. "Every wicked problem is essentially unique."
8. "Every wicked problem can be considered to be a system of another problem."
9. "The existence of a discrepancy representing a wicked problem can be explained in numerous ways. The choice of explanation determines the nature of the problem's resolution."
10. "The planner has no right to be wrong."

Briefly, these ten items are intended to capture the complexity of issues that cannot be effectively dealt with definitively and through one course of action. As they put it, "pluralities of objectives

held by pluralities of politics makes it impossible to pursue unitary aims.” Many complex issues in the world have some desirable impacts and some negative unintended consequences, such as, the use of fossil fuel for heating and which has multifunctional benefits for human life but also creates pollution as well. These are examples of wicked problems that began to take on public prominence during the politics of the 1960s and 1970s.

The complex interplay among such clusters as, capitalism, pollution, and environmental sustainability, or, the economic distribution of wealth and income disparities, creates a number of wicked problems where interventions in a “free market” create solutions that are partial at best and follow Rittel and Webber’s point 3 above, for example, where public or political intervention may mitigate some ethical concerns regarding social justice problems while leaving many unsolved. Many issues raised during the period of highly engaged community protests were concerned with issues, such as, the by-products of business production, which pollute rivers, lakes, and the air in ways that were perceived to be unsustainable. Animal rights activists also raised issues of harmful use of animals in testing of drugs and cosmetics.

Incompatible complex goals frequently seem incommensurable and oppositional in nature. In a business context, extreme global poverty exists in the face of excessive wealth. Jeff Bezos 2020 salary is listed as \$200 billion USD while as Roser and Ortiz-Ospina (2013) note, “Most people in the world live in poverty. Two-thirds of the world population live on less than 10\$ - int per day. And every tenth person lives of less than 1.90\$ - int per day.” In a world with such extreme disparities in distribution of income and wealth, where do ethical issues of social justice become a consideration?

By the early 1980s, these issues started to be formulated in the context of various scholarly disciplines where research in Business Ethics looked at wicked problems from the perspectives of Sociology, Psychology, Business Administration, Philosophy, Economics, Religious Studies, and various others. All of these disciplinary and interdisciplinary perspectives looked not just at

business economic outcomes but also at the ethical considerations that such practices raised. Required or recommended university courses in business ethics were introduced into the curriculum for students studying Business and Commerce as well as undergraduates in Philosophy, Religious Studies, Political Science, and Public Administration, among others.

## Business Ethics and Ethical Theory

Business Ethics, like all applied ethics fields, is grounded in ethical theory. Ethical theories are the systematic study of moral decision-making. There are a number of ethical theories that serve as foundational grounds in which to situate business ethics. Some of these theories are: deontology, utilitarianism, virtue ethics, and the ethics of care. Each has strengths and limitations, advocates and critics. The most dominant two theories usually discussed in the context of business ethics are deontology and utilitarianism. Both of these topics are discussed in more detail in specific independent chapters of these topics.

## Deontology

Briefly, deontology is a theory developed in the eighteenth century by Immanuel Kant. It is based on a belief that there are universalizable moral maxims or rules that Kant believed could be rationally intuited. These moral maxims are only morally operationalized, according to Kant, when they are acted upon both independent of the wishes and desires of the actor and independent of the consequences of the action. As Kant (1995) puts this latter point,

...[A]n action that is done from duty gets its moral value, *not from the object* it is intended to secure but from the maxim by which it is determined. ...[and] if only the *principle* by which it is determined to act is independent of every act of sensuous desire.

Kant also claims that there is a universalizability requirement that all moral maxims must be always followed, without exception, and further, that all rational human beings

must be universally treated as an end of themselves and never as a means to some other ends.

Critics of deontology usually cite two main flaws with the theory. One is that it seems fundamentally wrong to never contemplate the consequences of following a moral maxim which can result in a mix of benefits and harms to people impacted by following the rule. A second criticism is that universalizability seems an arbitrary rather than a rationally intuition expectation for moral action.

## Utilitarianism

Utilitarianism was also an ethical theory initially posited in the eighteenth century by Jeremy Bentham and the Radical Philosophers of the time. The two authors most closely identified with Utilitarianism and Bentham and John Stuart Mill who edited and published Bentham's work and further developed, explained, and extended Bentham's theory of Utilitarianism. John Stuart Mill was raised in a highly unorthodox and intense fashion from early childhood by his father, James Mill. He basically was educated from a very young age in very complex and advanced subjects with his father as educator. As an adult, John Stuart Mill edited the works and papers of Bentham for publication as well as publishing many of his own books on various philosophical topics, including his own book on Utilitarianism. Generically, utilitarianism is understood to be the recommendation that in deciding what is a morally good rule or act to follow, one should do what maximizes good over bad. Bentham's articulation of doing what was morally good was described in terms of maximizing pleasure and minimizing pain. This led to critics associating utilitarianism with hedonism. Mill took exception to the characterization and in his treatment of utilitarianism argued against characterizations of utility in terms of individual desires. He states (Mill 1863, 24)

I must again repeat, what the assailants of utilitarianism seldom have the justice to conduct is not the agent's own happiness, but that of all concerned. As between his disinterested and benevolent spectator... to love your neighbour as yourself, constitute social arrangements should place the

happiness, or, ...the interest, of every individual, in harmony with the interest of the whole; and secondly, that education and opinion, which have so vast a power over human character, should so use the power so as to establish in the mind of every individual an indissoluble association between his own happiness and the good of the whole...

Thus, Mill believes that with education, all persons in a society will understand that what is morally good is to follow rules or actions which maximize good outcomes for the majority of individuals in that society. Further he asserts that educated persons will operate in such a way as to objectively maximize average utility for the majority and not simply try to follow rules that only favor oneself. Mill believes that education is fundamental to the successful operation of utilitarianism because it allows persons to learn to appreciate higher order goods, like education, good government, and health, for example, over lower level goods like eating and pleasuring one's sensations.

The main criticisms of utilitarianism are the following: (1) Maximizing the good for the majority may mean that the minority still suffers and does not benefit from the good; (2) Quantifying what is good for the majority is difficult and contentious; (3) Utilitarianism justifies scapegoats since intentional harm to some innocents may result in a greater good for the majority; and finally, (4) That human nature becomes more benign and capable of disinterested decision-making through education which is an empirical claim for which Mill did not provide valid empirical justification.

## Connections Between Ethical Theory and Teaching Business Ethics

Because all applied ethics have a foundation in ethical theory, students in Business Ethics are minimally introduced to these key ethical theories to provide a context for the discussion of contemporary issues and theoretical approaches to Business Ethics. As noted above, depending on who teaches the course and where it is taught (e.g., a Commerce Department or a Philosophy

Department) students may or may not be introduced to other ethical theories.

## Contemporary Teaching of Business Ethics

As noted in the beginning of this entry, teaching Business Ethics as an independent field of study emerged within universities during the late 1970s and early 1980s. The early literature explored the nature and extent of the responsibility in addition to the responsibility that businesses had to make money for their owners and/or stockholders in the company. In fact, earlier literature in the 1960s voiced early articulations that businesses existed not just for the purpose of economic flourishing but also noted that businesses exist within society and as such hold some social responsibility to the society. As one early author, McGuire (1963) articulated this contention, “The idea of social responsibilities supposes that the corporation has not only economic and legal obligations but also certain responsibilities to society which extend beyond these obligations.”

Much of the literature at the time referred to the social responsibilities of business which later was more clearly delineated and defined as corporate social responsibility as well as stakeholder theory. While many authors articulated a case for a larger societal responsibility of business to community, one famous critique who opposed any larger societal responsibility came from Economist Milton Friedman.

As Poff (2020) summarizes this critique:

[Friedman] has been the catalyst for decades of discussion about the purpose and responsibility of business to shareholders and to society.

In 1970, Nobel Prize-winning economist, Milton Friedman, popularized a view he first articulated in his 1962 book, *Capitalism and Freedom*, in a 1970 *New York Times* article. That article was and continues to be the impetus for ongoing critiques which question most of the assumptions in Friedman’s arguments. In that article, entitled “The Social Responsibility of Business is to Increase Its Profits,” Friedman (18–23) made the following claims:

1. “In a free-enterprise, private-property system a corporate executive is an employee of the owners of the business.”

2. As such, “. . . He has direct responsibility to his employers.”
3. To fulfill that responsibility, he must act solely as an agent to the desires of the principals who are his employer.
4. Those principals’ sole desire “generally will be to make as much money as possible while conforming to the basic rules of society, both those embodied in law and those embodied in ethical custom.”
5. Further, he states that businesses are merely artificial persons and cannot be said to have “responsibilities, even [in a] vague sense.”
6. If an executive of a business acts in socially responsible ways while he is acting as an executive, he is violating claim 3 which is akin to taxation without representation.
7. If an executive’s socially responsible behavior results in raising costs to consumers, “he is spending the customers’ money.”
8. If an executive’s socially responsible behavior results in the suppression of employee wages, then “he is spending” employee wages.
9. Executives are not experts in socially responsible choices the outcomes of which, in addition, are uncertain even if the choice is correct.
10. Most damning, Friedman argues that interfering with social initiatives by executives undermines a free society.

Friedman’s fundamental, underlying foundational assumption is based upon Adam Smith’s theory of the “invisible hand.” In Smith’s 1776 treatise, *The Wealth of Nations*, he articulated his theory of how following rational self-interest in the pursuit of one’s own business operates, not only to improve the common good but to do so in a manner that is better than if one consciously attempted to create such a good. In the famous quote from Smith on this matter, he stated:

As every individual, therefore, endeavors as much as he can, both to employ his capital in the support of domestic industry, and so to direct that industry that its produce may be of the greatest value; every individual necessarily labors to render the annual revenue of the society as great as he can. He generally, indeed, neither intends to promote the public interest, nor knows how much he is promoting it. By preferring the support of domestic to that of foreign industry, he intends only his own security; and by directing that industry in such a manner as its produce may be of the greatest value, he intends only his own gain; and he is in this, as in many other cases, led by an invisible hand to promote an end which was no part of his intention. Nor is it always the worse for the society that it was no part of it. By pursuing his own interest, he frequently promotes that of the society more effectually than when he

really intends to promote it. I have never known much good done by those who affected to trade for the public good. It is an affectation, indeed, not very common among merchants, and very few words need be employed in dissuading them from it.

Perhaps no other single article has been the object of so many critiques in Business Ethics than this one article. It continues to provide fodder for articles in Business Ethics Theory; Stakeholder Theory, and Corporate Social Responsibility.

## Teaching Business Ethics

Briefly, in teaching business ethics three foci can be clearly identified. Business Ethics Theory appeals to traditional moral philosophy to identify reasons why businesses cannot and should not narrowly define themselves are constrained by contained within their economic interests. Stakeholder Theory identifies broader categories of responsibility than merely the stockholders of a company. These include but are not limited to: consumers; employees, the environment, and the impact of the economy on human rights and social justice. Corporate Social Responsibility includes discussions concerning ethical theory and the moral responsibility to include broadly based consumers in the economic calculus of profitability of business. Generally, all three perspectives are utilized in teaching business ethics as an academic discipline.

As technology, politics, globalization, and social justice claims evolve, Business Ethics continues to be a vital topic in the curriculum of university undergraduate and graduate education. What is clear is that the emergence of classical and contemporary issues in ethics will continue to make the field critical to education in many disciplinary fields.

## Business Ethics in Australia

Michael Schwartz

School of Economics, Finance & Marketing,  
Royal Melbourne Institute of Technology,  
Melbourne, VIC, Australia

## Introduction

Scientists describe Australia as the oldest, the flattest, and the driest of the inhabited continents, with the least fertile soil. Australia is also one of the most sparsely populated continents with its population of 26 million occupying a land mass of close to three million square miles. That is all true, but it is also misleading. Visitors flying in to Sydney, Australia's largest city, disembark in a large, dynamic, densely crowded, modern city with lush vegetation and close by the majestic splendor of the Blue Mountains. So much that is said about Australia is not quite so, and this applies to business ethics in Australia too. Last year a global ethics body, Ethisphere Institute, recognized an Australian bank as one of the most ethical companies in the world (Utlej 2019). Yet, that same month, the Roy Morgan Net Trust Score Survey (Morgan 2019) reported a remarkable rise in distrust of Australia's major banks following the release of the government commissioned report into the banking industry.

Australia's geographic size influences how the country is perceived. Australia alone occupies an entire continent. Australia's total area makes it the sixth-largest country in the world. One might therefore assume that space is not an issue. However, while physical space is not an issue, Australia's geographic location most certainly is. Napoleon Bonaparte argued that geography is destiny. Napoleon Bonaparte influenced Britain's desire to colonize Australia. This chapter argues Australia's geographic location has a major influence upon Australian business ethics. Consequently, in this chapter, Australian business ethics is considered from a historical perspective.

## Developments in Australian Business Ethics

Australia's population is not nearly as large as that of Texas. Nonetheless, Australian researchers make a disproportional contribution to publications such as the *Journal of Business Ethics*. Currently, Melbourne's Cranlana Centre for Ethical Leadership is experiencing increasing demand for programs on "how to build an ethical business culture" (Trinca 2019, p. 10). Furthermore, the Responsible Investing Association Australasia reports that with environmental, social, and governance (ESG) focused companies, Australia is ahead of the United States with many Australian investors seeking a "moral capitalism" (Kirby 2019, p. 16). However, some remain highly cynical as to claims by business leaders regarding ESG arguing that "a decline in honesty and integrity in business" (Creighton 2020, p. 12) facilitates empty promises. Others, deploring the destruction of stockholder capitalism and its replacement in Australia by stakeholder capitalism, insist that Australian "courts apply the notion of shareholder primacy to separate legitimate from illegitimate uses of shareholders' money by management" (Albrechtsen 2020, p. 12).

Australian business ethicists have contributed to our understanding of the ethics of economic activity in Australia. So have the conferences of organizations such as the "Australian Association for Professional & Applied Ethics" (<http://aapae.org.au/>).

Australian politicians such as Tony Abbott and Malcolm Turnbull, both of whom would later become Australian Prime Ministers, have attended "Australian Association for Professional & Applied Ethics" conferences. Fundamentally, however, Australian business ethics has been influenced by the prevailing historical circumstances.

Historians write that by the end of the eighteenth century "Britons [were] devoted to truth" (Welsh 1992, p. 13). Perhaps that devotion manifested itself in the enthusiasm with which they shipped even their most minor criminals of to Australia. Often this was after criminal trials of less than 5 min duration which resulted in "seven years transportation" (Sackville-O'Donnell 2002, p. 85). Needless to say, some of those unfortunates had great entrepreneurial skills: As did their offspring. John Solomon – the son of two convicts – became "an affluent bullion merchant" (Sackville-O'Donnell 2002, p. 149). Australia offered John Solomon (1808–1889) "great opportunities for legitimate financial and social advancement, opportunities that England had denied his father" (Sackville-O'Donnell 2002, p. 149). Such opportunities allowed those who succeeded in business to become public benefactors. John Solomon was such a benefactor. He lived in an era in which the ethical expectation in Australia was that those who prospered financially would contribute to the larger community.

Nearly one century later another penniless migrant to Australia, Sidney (Simcha) Myer (1878–1934), created Australia's largest and most successful retail empire. Myer insisted that his business would be "as celebrated for its morals as for its merchandise" (Pratt 1978, p. 128). Furthermore, his employees "were taught to regard their work as a social service and themselves as servants of society rather than as employees of a corporation" (Pratt 1978, p. 129). Sidney Myer believed that regarding his wealth "he was a transitory guardian and trustee for others" (Pratt 1978, p. 138). Myer helped subsidize the Melbourne Symphony Orchestra, Melbourne University, and the Children's Hospital. Myer argued that "it is the responsibility of capital to provide work" (Pratt 1978, p. 157). During the

Great Depression he inaugurated “a ‘Restore Confidence-Relieve Unemployment’ campaign” (Pratt 1978, p. 150) and spent large sums of his personal wealth helping those suffering. Regarding the ethical expectations of business in Australia, Myer contributed by his example to the start of an era of enlightened stakeholder management. Peter Drucker differentiated between “the social responsibility of wealth . . . [and] . . . the social responsibility of business” (1987, p. 321). Solomon would only have envisaged the former. Myer envisaged the latter and in doing so advanced Australian business ethics.

However, by the end of the twentieth century, another economic philosophy governed Australian business and influenced Australian business ethics. This was the free market economics of Friedrich Hayek (1899–1992) and Milton Friedman (1912–2006). Both Hayek and Friedman visited Australia giving seminars and meeting with political figures. In 1998, under the influence of that philosophy, the entrepreneur, Chris Corrigan initiated the so-called Waterfront Dispute and attempted to sack the heavily unionized workforce and reform labor practices. John Howard, who was Prime minister of Australia at that time, wrote that the “debate over the ethics or otherwise of the restructuring reflected the cultural division in the Australian community” (Howard 2011, p. 294). Howard argued that both capital and labor had responsibilities to the enterprise and to society. During the waterfront dispute, the onus was on the responsibilities of labor. After the disruptions caused by the Global Financial Crisis (2007–2008), that onus would shift to the responsibilities of capital.

## Current Events

In recent years, among other shenanigans, Australia’s largest bank, the Commonwealth Bank, admitted “charging dead customers fees for financial advice” (Nielsen 2019, p. 12). Furthermore, the Commonwealth Bank was not an isolated example of such immoral conduct. Scandalous financial behavior was also reported at the National Australia Bank, Westpac, and the ANZ

Bank. Those four banks are Australia’s largest banks. Such behavior arose despite the Australian government’s Future of Financial Advice (FoFA) 2013 legislative reforms which legally forced financial advisers to act in the best interest of their clients. The Australian government’s initial reaction was to establish, in September 2017, the Australian Financial Complaints Authority to resolve disputes between the banks and their customers. Political pressure nonetheless continued to rise and consequently, on the 14th of December 2017, the Australian government established the Royal Commission into Misconduct in the Banking, Superannuation and Financial Services Industry to investigate these accusations. This commission is also known as the Banking Royal Commission and the Hayne Royal Commission as the former Justice of the High Court of Australia, the Honorable Kenneth Hayne, served as sole Commissioner. The Hayne Royal Commission, after interviewing 130 witnesses and after reviewing over 10,000 public submissions, submitted a report to the government on the first of February 2019 with 76 recommendations.

Prior to the establishment of the Hayne Royal Commission business ethics in Australia was disintegrating. Forty three percent of Australian respondents to the 2017 EY Asia-Pacific Fraud Survey believed that colleagues whose practices were ethically questionable were more likely to be promoted. Furthermore, nearly one-third of the Australian respondents believed that ethical conduct in business was deteriorating. Such perceptions continued the following year. In 2018, The Governance Institute of Australia’s Ethics Index showed Australian society as less ethical that year than the previous year. That 2018 survey revealed that the most distrusted professionals in Australia were bankers, real estate agents, and mortgage brokers (Lane 2018). Currently, that situation remains unchanged. The 2020 Australian Banking Brand and Trust Index confirm the ongoing mistrust of bankers and particularly of Westpac and AMP (Moullakis 2020). Currently, the former CEO of Westpac stands accused in a US class action of contravening United States federal security laws.

It remains unclear as to what the eventual implications of the Hayne Royal Commission will be for business ethics in Australia. In July 2018, the Banking Executive Accountability Regime (BEAR) was introduced. BEAR imposes “a tougher responsibility and accountability framework on bank directors and senior executives ... (with) ... accountability maps so key officers can no longer escape the legal consequences of their actions” (Gluyas 2020, p. 22). Furthermore, the government responded to the Hayne Royal Commission by creating the Financial Adviser Standards and Ethics Authority which has “issued a code of ethics with 12 standards covering ethical behaviour, client care, quality process and professional commitment” (Kohler 2020, p. 24). However, the Australian Securities & Investments Commission reported that of the 13 referrals made to it by the Hayne Royal Commission “the corporate watchdog has dumped three royal commission referrals” (Roddan 2020, p. 22) as there was no possibility of a successful prosecution for the alleged law-breaking.

Despite the recent Hayne Royal Commission, and initiatives such as BEAR and the Financial Adviser Standards and Ethics Authority, some of Australia’s largest banks continue to act immorally. Shamefully, the Australian Transaction Reports and Analysis Centre (Austrac) tasked by the Australian government with identifying money laundering and organized crime, recently found that Westpac Bank was facilitating child pornography. Australian Prime Minister Scott Morrison, reflecting that Australia had recently been through the Hayne Royal Commission, said that “the allegations Westpac had not previously detected transactions suspected of being linked to the horrific trade left him in “complete disbelief”” (Morrison as quoted by Schliebs 2019, p. 11). The Australian Federal Police confirmed it was working with Austrac to investigate Westpac Bank.

Such disgraceful conduct by one of Australia’s largest banks is appalling. Unfortunately, Australia has a long history of corporate scandals. These scandals include Qintex Ltd., the Pyramid Group, Trio Capital, Storm Financial, and many others all of which – along with the “scandalous

behaviour [of banks and financial service firms] uncovered by the royal commission” are explored in great detail by Annelise Nielsen (2019, p. 126). Nielsen also discusses the personalities involved in these affairs. In doing so, she reminds us of the national ire aroused in October 2014 by Greg Medcraft – then the chair of the Australian Securities & Investments Commission – when he described Australia as a “paradise for white-collar criminals” (Medcraft quoted by Nielsen 2019, p. 75). Earlier that same year Ugur Nedim (2014) reported on white-collar crime in Australia. In doing so, Nedim quoted PricewaterhouseCoopers research which showed within the previous 2 years white-collar crime was experienced by “57% of Australian organizations” (Nedim 2014, p. 1). Given the extent of white-collar crime in Australia, it is worth contemplating why Medcraft’s seemingly valid observation – and as the current chair of the Australian Securities & Investments Commission Medcraft was well placed to make such a statement – aroused such widespread anger within Australia. The reason why this is worth contemplating is that white-collar crime is one manifestation of the failure of business ethics.

## The Future Implications of Past Events

This chapter argued at the very outset that in Australia things are not always as they might appear. Australian history lays great emphasis on the fact that the country was founded in January 1788 as a penal colony. Indeed, Barlass (2019) explains how proud contemporary Australians are of their convict heritage. And as Perry (2014) highlights, the nineteenth century Australian bank robber, Ned Kelly, is now an Australian icon. Yet, paradoxically, such pride as to a convict heritage might not easily co-exist for Australians with current claims by the chair of the Australian Securities & Investments Commission that your country is paradise for criminals. Instead the national psyche might relegate such criminality to a bygone era. Nonetheless, the renowned historian, Paul Johnson, writes how the birth of Australia “was, and among historians still is,

surrounded by controversy” (1991, p. 249). A large part of that controversy is the fact that most histories of Australia ignore the fact that the British established Australia in 1788 not simply as a penal colony, but simultaneously because of their “hopes of an ‘Australian’ sea-route to China” (Darwin 2013, p. 24); and their ambitions for trade with China and for new markets in China.

Darwin describes the “crisis-ridden 1770s” (2013, p. 25) with Britain at war with, among others, the Spanish and the French. And from 1781–1784, Holland too was at war with Britain (Landes 2002). Because those powers controlled the territories surrounding the South China Sea, British shipping needed “a safe alternative route to China” (Fry 2016, p. 63) hence the establishment in 1788 of the settlement at Sydney’s Botany Bay which allowed British ships another route to China. Britain feared that their European markets would be closed, as they soon were during the Napoleonic Wars (1803–1815). Therefore British manufacturers believed “that there needed to be a large increase in British exports to China” (Fry 2016, p. 63). Consequently, though it might be conveniently forgotten, Australia exists largely because of the desire for trade with China.

That past has enormous implications for contemporary business ethics in Australia. Alva Devoy, the managing director of Fidelity International in Australia, recently correctly described the Australian economy as being “to a degree a derivative economy of China” (Devoy as quoted by O’Dowd 2020, p. 17). China is by far Australia’s largest trading partner. Since the 1980s, Australia has largely forsaken manufacturing. Instead, most manufactured goods are imported from China. Globalization led to enormous structural changes in the Australian economy. One major change was the loss of blue collar work to workers abroad. That loss of blue collar employment is a business ethics dilemma which Australia still has to resolve, despite the arguments that in Australia, the coronavirus is currently “forcing people to rethink their supply chains” (Korporaal 2020, p. 25). Australia willingly surrendered its manufacturing sector which has significant implications for both Australian

workers and the country itself. A recent study on economic complexity by the Harvard Kennedy School of Government “found that while Australia was the eighth richest nation, we [Australia] ranked 93<sup>rd</sup> for complexity” (Sheridan 2020, p. 12). Australia exports resources and can continue to do so if the resources do not run out, and demand continues. Should that not happen Australia will rue their decision to ignore its manufacturing sector and “instead to be fat and happy, and hope that history never comes calling” (Sheridan 2020, p. 12).

Australia’s three largest exports are coal, iron ore, and gas. And the largest customer is China. In short, Australia is “a single export, single market economy” which while currently lucrative reveals a “lack of complexity, lack of productivity, lack of innovation and lack of future – as well as grave limitations on national security and independence” (Sheridan 2020, p. 12). Australia’s current business relationship with China creates ongoing business ethics dilemmas. Australians have grown rich exporting resources to China. Australian mining magnates such as Andrew Forrest, who ranks amongst Australia’s richest individuals, fearful of the ramifications of Australian Prime Minister, Scott Morrison’s demands as to an inquiry into the origins of the coronavirus insisted that “Australia should take a more conciliatory approach to China ... [and] ... blindsided the Morrison government by helping a Chinese diplomat gatecrash a ministerial press conference at the height of Australia’s most serious rift with Beijing in decades” (Packham and Ferguson 2020, p. 1). Business ethicists have long recognized the conflicts created by financial interests attempting to thwart the democratic process.

There are of course many other ethical dilemmas created by Australian resource exports to China (Schwartz 2013). One recent example is ALS Limited which is a major Australian corporation with turnover of AU\$1.3 billion and 11,500 employees. The company provides testing, inspection, verification, and certification services. Recently there have been allegations that ALS faked the testing of samples of coal being exported to inflate their value. ALS chief executive, Raj Naran, insisted that despite this lapse

“integrity and ethical conduct are critical to our business” (Naran as quoted by Williams 2020a, p. 20). Nonetheless, “a probe initiated by the company found 45 to 50 per cent of certificates were manually changed without justification” (Williams 2020b, p. 9) and the Australian police were being called in. Australia exists because of its long standing relationship with China. The Australian industrialist Clive Palmer might be wrong in his recent allegation that the Australian Securities & Investments Commission “is doing the Chinese government’s bidding” (Palmer as quoted by Elks 2020, p. 3), but Australia’s economic relationship with China will continue to affect Australian business ethics.

However, for most Australians, there is a more immediate and essential dilemma which is unrelated to Australia’s geographic location. Although, arguably, obliquely related to the claim made in 1994 by Paul Keating when serving as Australian Prime Minister that “Australia is at the arse end of the world”. Inevitably, the current coronavirus pandemic has had the same results in Australia as everywhere. And Australians want toilet paper. The shortage of toilet paper and other items attracted price gougers and “profiteers exploiting the chaos at supermarkets” (Schliebs 2020, p. 3). This has aroused the ire of the Australian Competition and Consumer Commission. Consequently, Australia remains beset by ethical issues in business.

## Business Ethics in Canada

Mark S. Schwartz  
School of Administrative Studies, York  
University, Toronto, Canada

### Introduction

Canada is a relatively young country, gaining the right to self-governance from Britain in 1867 and only becoming fully independent by establishing its own constitution in 1982. Canada is the second largest country in the world in terms of land mass after Russia and possesses extensive natural resources. Canada has a multiethnic population of over 35 million people which is often referred to as a “cultural mosaic,” whereby ethnic and cultural identities tend to remain intact, rather than being a “melting pot” by which greater assimilation takes place. The two most distinct

societies and cultures within Canada are represented by its Indigenous or Aboriginal communities and its minority French-speaking population living primarily in the province of Quebec. Partially influenced by business scandals and corporate legislative developments taking place in its large southern neighbor, the United States, and through global trade with the rest of the world, Canada has over time developed a similar yet also unique set of business ethics-related institutions and practices.

Business ethics practices can be defined both narrowly and broadly. One set of dimensions of business ethics activity in any given country using a broad definition of business ethics was suggested in the “Business Ethics National Index” (BENI) (Schwartz and Weber 2006). According to this index, business ethics activity cuts across several dimensions. For the purposes of this entry, the following dimensions will be discussed in relation to Canada: a history of business ethics scandals, the extent of misconduct, corporate ethics programs, business ethics-related legislation, business ethics in academia, and business ethics organizations. The entry builds on previous descriptions of business ethics in Canada including articles contained in a special issue of the *Journal of Business Ethics* (Boyd 1997; Brooks 1997; Di Norcia 1997; McDonald 1997; Michalos 1997; Pasquero 1997) as well as one encyclopedic entry (Poff 2015). What follows will both update the previous studies and describe in more detail several of the institutionalized elements of Canadian business ethics.

### History of Canadian Business Ethics Scandals

Canada is a country not devoid of business ethics scandals. The Hudson's Bay Company, one of the world's oldest companies established by the Royal Charter in England in 1670, entered fierce competition with another fur trade company, the North West Company, in the land that was later to become Canada. Given the amount of money at

stake, this competition over the fur trade sometimes became physically violent, leading to the origins of the term “cut-throat competition.” Since then, like in every country, other Canadian business firms and industries have faced ethical challenges and experienced scandals. One of the most famous Canadian business ethics scandals involves the exploration company Bre-X Minerals, which after reportedly finding an extensive gold deposit in Indonesia went from being a penny stock to a CAD\$6 billion company. The stock price then collapsed in 1993 following the discovery that the core samples had been tainted with gold dust leading to the loss of billions for investors. A Hollywood movie “Gold” was released in 2016 that portrays many of the events that took place at Bre-X.

Several Canadian companies have been involved in bribery scandals around the world over the years including aerospace company Bombardier, SNC-Lavalin, and engineering consulting firm Acres International. Talisman Energy, a Canadian-based multinational oil and gas company, eventually left Sudan in 2003 as interest groups accused the company of indirectly assisting human rights violations by the Sudanese government in its civil war leading to millions of civilians being killed. Other Canadian mining companies have suffered over the years from scandals related to environmental issues, corruption, impacts on indigenous populations, forced labor, and other human rights concerns including Goldcorp in Latin America, Barrick Gold in Africa, and Nevsun Resources in Eritrea.

More recently, Canadian bank CIBC settled a class action lawsuit in 2005 for US\$2.4 billion for its role in the Enron accounting scandal. Canada’s two biggest tobacco companies, Imperial Tobacco and Rothmans, Benson & Hedges, agreed to pay over CAD\$1 billion in 2008, representing the largest criminal fines and civil settlements in Canadian history, to settle charges the companies helped smuggle cigarettes into the country to avoid taxes. Nortel Networks, which became a global leader in telecommunications with 90,000 employees and worth CAD\$300 billion, collapsed

and declared bankruptcy in 2009 following an accounting scandal. Canadian-based online dating service company Ashley Madison, which promotes consensual affairs between married adults and has over 53 million members worldwide, faced a scandal in 2015 when the names of its members were publicized by hackers who were upset with the company’s activities and illegally obtained the company’s client information. Pharmaceutical firm Valeant, which at one point was Canada’s most valuable company, saw its stock price plunge in 2016 after being accused of unethical activities including price gouging. Canadian banks were being investigated in 2017 for unethical sales practices, including pushing employees to reach unrealizable sales goals by selling unnecessary products and services. The share value of Canada’s largest nonbank lender of mortgages, Home Capital, plunged two-thirds in 2017 from CAD\$2.5 billion to CAD\$300 million after the company was accused of making misleading statements about fraud committed by mortgage brokers through falsifying the incomes of mortgage applicants.

In terms of individual white-collar crime, Conrad Black, the former CEO of Canadian media company Hollinger International, was sentenced in the United States in 2007 to 6 years in jail for fraud and obstruction of justice. In 2009, cofounder Garth Drabinsky of the Canadian film and theater company Livent was found guilty of misstating the company’s financial statements and sentenced to 5 years in prison. In 2010, Toronto lawyer Stan Grmovsek was sentenced to over 3 years in prison for one of the biggest Canadian insider trading cases. The scheme earned him and a friend approximately US\$9 million and represented the first criminal sentence in Canada ever imposed for insider trading.

Such corporate scandals and white-collar crime will no doubt continue as Canadian executives face various moral temptations and engage in a moral rationalization process to justify their misconduct, while Canadian businesses face the challenge of competing ethically in the global economy.

### Misconduct in Canadian Business Firms

In Canada, similar to the United States, 42 percent of employees have observed some type of misconduct during the previous year (Ipsos Reid 2013). The major types of workplace misconduct observed include misuse of company property (28%) (e.g., misuse of confidential information, customer or employee privacy breach), harm to people (25%) (e.g., abusive behavior, lying to employees, discrimination, health or safety violations, sexual harassment, etc.), privacy violations (17%) (e.g., misuse of confidential information, customer or employee privacy breach), fraud (17%) (e.g., stealing, falsifying time sheets/expense reports, employee benefits violations), conflicts of interest (13%) (e.g., insider trading), and environmental violations (12%) (e.g., dumping of hazardous waste, violating environmental standards) (Ipsos Reid 2013). In addition, thirty six percent of Canadian companies reported being the victim of economic crime, including asset misappropriation (62%), cyber-crime (28%), procurement fraud (21%), human resources fraud (17%), and bribery and corruption (14%) (PWC 2016). Although nurses (92%) and doctors (89%) are highly respected professions in Canada, bankers (50%) and business executives (47%) are much less respected, while car salespeople (28%) and politicians (24%) are the least respected professions (Insight West 2017).

### Corporate Ethics Programs in Canada

In terms of corporate ethics programs, 86 percent of Canada's 1000 largest companies had a document that outlines their values and principles already by 1999 (KPMG 2000). The following additional ethics program elements were reported in a survey of Canada's largest 500 corporations (Singh 2011): ethics training (57%), ethics committee (55%), position of ombudsman

to report unethical practices (64%), ethics audit to evaluate ethics performance (54%), and guidelines to support whistleblowers (89%). The vast majority of respondents (92%) believed that codes had a positive impact on their organizational policies. There are now a variety of Canadian industry associations that have developed codes of ethics for their members, including the forestry industry ([www.cif-ifc.org/wp-content/uploads/2014/05/Code\\_of\\_Ethics\\_English.pdf](http://www.cif-ifc.org/wp-content/uploads/2014/05/Code_of_Ethics_English.pdf)) and the mining industry ([mining.ca/towards-sustainable-mining/tsm-guiding-principles](http://mining.ca/towards-sustainable-mining/tsm-guiding-principles)). Following a tragic leak of a deadly toxic gas from a pesticide plant in Bhopal India in 1984 that killed thousands, the Canadian chemical industry developed its "Responsible Care Program" now practiced around the world ([www.canadianchemistry.ca/responsible\\_care/index.php/en/our-commitment](http://www.canadianchemistry.ca/responsible_care/index.php/en/our-commitment)) which is designed to improve health, safety, and environmental performance of chemical-producing firms.

### Business Ethics-Related Legislation in Canada

While Canada for many years lagged behind other countries including the United States in terms of business ethics-related legislation, it now appears to be catching up. In terms of anti-corruption legislation, while the United States promulgated its *Foreign Corrupt Practices Act* back in 1977, Canada only did so by passing the *Canadian Corruption of Foreign Public Officials Act* (CFPOA) in 1999. The law ratified the *OECD Convention on Combating Bribery of Foreign Public Officials in International Business Transactions*. The CFPOA applies to both individuals and companies and makes it a criminal offense to bribe a foreign public official to obtain or retain a business advantage. The maximum penalties include 14 years of imprisonment and millions in

finances [1998, c. 34]). The legislation was amended in 2013 to tighten many of its provisions including the removal of the facilitation payment exception (payments to secure performance of routine acts by low-level government officials). While the actual enforcement of the CFPOA remains questionable, in terms of perceived corruption, Canada now ranks quite well as the ninth least corrupt country out of 176 countries in Transparency International's Corruption Perceptions Index (CPI) ([www.transparency.org/news/feature/corruption\\_perceptions\\_index\\_2016](http://www.transparency.org/news/feature/corruption_perceptions_index_2016)).

With respect to whistleblower protection, at least on paper, the *Canadian Criminal Code* (section 425.1) which went into effect in 2004 offers protection for external whistleblowers (those who report wrongdoing to parties external to their firms such as the government) in all jurisdictions in the private and public sectors, including protection against threats and retaliation against employees. In 2005, the Supreme Court of Canada extended the whistleblowing provision to those who report wrongdoing internally to individuals within their firms as well [see: *Merk v International Association of Bridge, Structural, Ornamental and Reinforcing Iron Workers*, LOCAL 771, 2005 SCC 70, 260 DLR (4th) 385]. Other federal and provincial legislation provide a degree of protection to government officials who report wrongdoing. In 2016, the province of Ontario adopted the Ontario Securities Commission's (OSC) new Whistleblower Program, which includes monetary incentives up to CAD\$5 million for whistleblowers and amendments to Ontario's *Securities Act* to provide additional protection to persons who report a potential violation of Ontario security law. Whether or not these legislative protections will actually protect employees remains in question. There have been many famous Canadian whistleblowers over the years who have suffered retaliation and harassment, including Dr. Nancy Olivieri, who blew the whistle on the drug firm Apotex by publishing a study in 1998 on possible life-threatening dangers of a new drug that she was testing on trial patients.

Since 2004, Canadian companies, as well as their directors or officers, can be held guilty for

crimes under Bill C-45 – *An Act to Amend the Criminal Code (Criminal Liability of Organizations)*. In terms of directors and officers, while they cannot be convicted of a crime for acts of the corporation merely because of their status as directors or officers, they may be held criminally responsible if they are directing the corporation to commit crimes that will benefit the corporation or are otherwise participating in criminal activities within the corporate context. Of course, Canada also possesses a robust civil liability legal system, and many Canadian companies have been successfully sued for their misconduct. This includes a historic CAD\$15.6 billion class action lawsuit in Quebec Superior Court against three Canadian tobacco companies in 2015, where the judge stated that the companies had put profits before the health of their more than one million customers by intentionally concealing harmful risks of their product.

## Academia and Business Ethics in Canada

While it took a number of years, it now appears that the vast majority of Canadian business schools offer either a mandatory or elective stand-alone course in business ethics, at both the undergraduate and graduate levels. In fact, already by 1989, 55 percent (23/42) of Canadian business schools offered either a mandatory (20%) or elective course (80%) in business ethics (Singh 1989). Since then, several universities have established business ethics chairs, with the first chair established in 1992 at York University's Schulich School of Business and first held by moral philosopher Professor Emeritus Wesley Cragg. Other Canadian universities that have established business ethics chairs include the Sauder School of Business at the University of British Columbia, the University of Calgary's Philosophy Department, as well as the *Université de Montréal*. There remain however relatively few Canadian business ethics textbooks. The first Canadian business ethics textbook, *Business Ethics in Canada* by Deborah Poff and Wilfrid Waluchow, came out in 1987, with the fourth edition published in 2004. Other Canadian business

ethics textbooks that have been published include *Ethical Issues in Business: Inquiries, Cases, and Readings* by Peg Tittle (2016); *Business Ethics: Concepts, Cases, and Canadian Perspectives* by Peter Kissick (2012); *Canadian Business and Society Ethics & Responsibilities* (third edition) by Robert Sexty (2014); *Business Ethics: Canadian Edition* by Damian Grace, Stephen Cohen, and William Holmes (2013); and *Business & Professional Ethics for Directors, Executives & Accountants* (eight edition) by Leonard Brooks and Paul Dunn (2018). Notably, the founding editors of the *Journal of Business Ethics* were based in Canada (Alex Michalos and Deborah Poff).

Several university-based business ethics centers have also been established. At York University's Schulich School of Business, the Centre of Excellence in Responsible Business (COERB) holds a variety of presentations. Ryerson's Jim Pattison Ethical Leadership Education & Research Program hosts several guest lectures each year. The Clarkson Centre for Business Ethics and Board Effectiveness is based at the University of Toronto. The University of Waterloo through its Centre for Accounting Ethics at Waterloo holds various activities, including an annual Ethics Symposium conference. Dalhousie University's Faculty of Management in Halifax, Nova Scotia, has hosted an annual "Ethics in Action" student case competition for a number of years. In 2017, Queen's University, along with the Chartered Financial Analyst (CFA) Institute, launched an "Ethics Challenge" student case competition as well. One of the most popular business ethics blogs is administered by Professor Chris MacDonald at Ryerson University ("The Business Ethics Blog" – [www.businessethics.blog.com](http://www.businessethics.blog.com)). Many student clubs have also been established at various Canadian universities as well, which primarily focus on broader business and society issues.

There now appear to be a number of full-time business ethics professors teaching and conducting research in universities and colleges across Canada. In terms of business ethics research, one research study (Chan et al. 2016) ranked York University as the number one academic institution

in the world in terms of quality of business ethics journal publications. Publication quality was measured by citation impact of articles published by the university's researchers in ten leading business ethics journals over a 14-year period from 1999 to 2012. The other Canadian academic institutions identified in the study that made it to the top 100 world list include the University of Calgary (28th), the University of Toronto (36th), Simon Fraser University (54th), the University of Western Ontario (78th), Queen's University (79th), and Saint Mary's University (85th).

One Canadian-based magazine, *Corporate Knights Magazine* ([www.corporateknights.com](http://www.corporateknights.com)), which addresses both business ethics issues and broader business and society concerns, generates an annual ranking of MBA programs on their sustainability activities which includes curriculum, institutes and centers, and faculty research. In the 2016 results, several Canadian business schools were identified in the list of the top 40 schools from around the world including York University, Schulich School of Business (1st); McGill University, Desautels Faculty of Management (6th); University of Calgary, Haskayne School of Business (9th); Saint Mary's University, Sobey School of Business (11th); University of British Columbia, Sauder School of Business (14th); Simon Fraser University, Beedie School of Business (23rd); Dalhousie University, Rowe School of Business (29th); University of Ottawa, Telfer School of Management (31st); and Concordia University, John Molson School of Business (35th).

## Business Ethics Organizations in Canada

There have been several business ethics organizations that have been established over the years. Transparency International Canada (<https://www.transparency.org/country/CAN>) was established in 1996 and has been very active in terms of lobbying the Canadian government regarding anti-corruption legislation, as well as holding a series of conferences and speakers. The Canadian Centre for Ethics & Corporate Policy ([www.ethicscentre.ca/EN](http://www.ethicscentre.ca/EN)) also holds various speaking

events. The Canadian Business Ethics Research Network (CBERN) ([www.cbern.ca](http://www.cbern.ca)) is an academic network which brings together through conferences and other activities Canadian business ethics academics. Founded in 1995, Canadian Business for Social Responsibility (CBSR) ([cbsr.ca](http://cbsr.ca)) is a nonprofit, business-led, national membership organization of Canadian companies and individuals that have made a commitment to operate in a socially, environmentally, and financially responsible manner, recognizing the interests of their stakeholders, including investors, customers, employees, business partners, local communities, the environment, and society at large. The Responsible Investment Association ([www.riacanada.ca](http://www.riacanada.ca)), formerly the Social Investment Organization, plays an active role in Canada's social investment industry. Members include mutual fund companies, financial institutions, asset management firms, advisors, consultants, investment research firms, asset owners, individual investors, and others interested in responsible investment.

There are now dozens of business ethics consultants in Canada. One of the first was EthicScan ([ethicscan.ca](http://ethicscan.ca)), founded in 1987 by David Nitkin and based in Toronto. In addition to its consulting activities, the firm now conducts many seminars on various business ethics-related topics. In 1995, a group of Canadian business ethics consultants formed an association called the Ethics Practitioners' Association of Canada (EPAC) ([epac-apec.ca](http://epac-apec.ca)) which holds roundtable discussions and webinars and maintains ethics standards for the ethics practitioners' profession. Michael Jantzi, CEO of Sustainalytics ([www.sustainalytics.com](http://www.sustainalytics.com)), has been very active in the social investment field and established the Jantzi Social Index (JSI) in 2000 which focuses on stocks that are socially and environmentally conscious. The largest ethical mutual fund in Canada, NEI Investments (formerly Ethical Funds) ([www.neiinvestments.com](http://www.neiinvestments.com)), was first established in 1986 and targets investment in companies based on their environmental, social, and governance performance.

## Future of Business Ethics in Canada

It is not clear how business ethics activities and practices will continue to evolve in Canada. No doubt additional corporate scandals will appear in the headlines. Canadian companies will continue to face pressures to engage in corruption around the world in order to win or retain business, and it is not clear whether societal, industry, or organizational mechanisms and norms will prevent such misconduct. Nonetheless, overall, Canada has now established itself in terms of business ethics leadership, with respect to corporate ethics programs, the teaching of business ethics, business ethics research, conferences, seminars, consultants, organizations, and centers. All of this activity will hopefully continue going forward to secure the importance of business ethics in the minds of Canadian business students, employees, managers, executives, and boards of directors.

## Business Ethics in the UK

Christopher J. Cowton  
Huddersfield Business School, University of  
Huddersfield, Huddersfield, UK

## Synonyms

Business ethics in Great Britain

## Introduction

With about 65 million inhabitants,<sup>1</sup> the UK comprises less than 1% of the globe's population. Nevertheless, it is a significant economy, a member of the Group of Eight (G8) industrialized nations, and London is currently the largest financial center in Europe and dominates worldwide in certain financial areas (Goddard and Wilson 2016). The UK's business framework is well established and influential; for historical reasons – namely, the British Empire, which at its zenith covered about a quarter of the world's population – its institutions and business practices have had influence out of line with its current economic power. Since 1974 it has in turn been affected as a member of the European Union (EU). However, at the time of writing, it is in the process of leaving the EU following the referendum of 2016 when approximately 52% of those who cast their vote expressed a preference for “Brexit.” How this will affect the strength of the economy, including the international position of the City of London, remains to be seen. The eventual implications of Brexit for regulatory frameworks and business practice are also uncertain, but like many relatively open economies, the UK is highly integrated into global trade systems, with the pressures toward convergence that this implies.

Nevertheless, there are some characteristics of UK business practice and regulation that, if not unique, are at least notable, especially because of their influence upon policy and practice elsewhere. This article therefore begins with a consideration of the legal framework for companies in the UK that both enables and constrains corporate activity. The next section examines the UK approach to corporate governance which, although of much more recent origin, has also had significant international influence. The third main section discusses some of the current ethical issues regarding UK business. The Conclusion completes the article.

<sup>1</sup> [www.ons.gov.uk/peoplepopulationandcommunity/populationandmigration/populationestimates](http://www.ons.gov.uk/peoplepopulationandcommunity/populationandmigration/populationestimates), accessed 02 October 2017

## The Legal Framework

The framework within which companies operate constrains or enables what might be viewed as “good” business practice. Indeed, without the legal framework, companies would not exist; they are a legal creation. The UK was the first modern “industrialized” economy and hence the first to develop institutions and practices that are now widely taken for granted, in particular the limited liability company possessed of a separate legal personality. Indeed, this innovation could be said to have been a major influence upon industrialization and economic development, rather than just a result of it, since it encourages the investment of large amounts of risk capital and enables continuity of operation. This institutional framework thus has benefits, but it also carries with it certain risks, including the possibility of excesses or abuse.

Nineteenth-century judges were particularly concerned about the ability of those engaged in business to walk away from debts when a company failed, protected by the corporate “veil” (i.e., the debts were those of the company itself). Well aware of the hazards of limited liability when compared with sole proprietorship or partnership, the courts, as they developed company law in tandem with statutory provisions, sought to protect creditors (Cowton 2011). It could be argued that incorporation with limited liability is still abused today, such as when business people recklessly leave creditors out of pocket or buy the company out of administration in a “prepack” set up in their favor – perhaps more than once.

As it developed, UK company law influenced many other countries, including the USA and, in particular, members of the former British Empire such as Australia and India. Milestones during the past century have included the Companies Acts of 1948 and 1967 and, subsequently, various pieces of legislation following the UK’s 1973 accession to the European Union (as it is now). These developments were consolidated in the Companies Act 1985, but this has now been superseded by the Companies Act 2006, which at the time was the longest Act in British Parliamentary history. One of the features of the increasingly voluminous and

complex body of statute law is a vast growth in the quantity and scope of information provided in, and with, the audited financial statements, thus extending accountability – particularly to shareholders. Yet still there exist calls for greater “transparency,” partly because of reduced confidence in summarized accounting numbers and partly because of interest in particular issues, including executive pay.

Many popular understandings of the position of shareholders, such as their owning the business, are legally and conceptually flawed (Cowton 2011). In the UK the legal tradition is that the primary duty of the directors is to the company itself. However, this duty can be interpreted as a duty to the body of shareholders as a whole, and it is certainly the case that the UK – like many other “Anglo-Saxon” regimes – is strongly shareholder-oriented. The rights of creditors can be asserted when a firm is in financial distress (Cowton 2011), but in everyday practice, shareholder primacy holds sway.

However, the Companies Act 2006 does appear to hint at a possible modification of shareholder primacy, at least in the eyes of some commentators, who view it as a piece of pro-stakeholder legislation. For Section 172(1) of the Act states that directors must have regard to (among other matters) the interests of the company’s employees; the need to foster the company’s business relationships with suppliers, customers, and others; and the impact of the company’s operations on the community and the environment. It can be argued, though, that the Section is too vague to have any real legal effect, and to the extent that its message is clear, it reasserts shareholder primacy, because it states that directors should have regard to the previously mentioned factors when acting in the way they consider, in good faith, would be most likely to promote the success of the company. At most, therefore, the Section seems to be a call for “enlightened shareholder value,” which arguably is what acting “in the interest of the company” should consist in anyway. Indeed, a member of the steering group whose report led to the passage of the Act comments that they thought there was a strong case for making explicit the law’s true

character, having come to the opinion that it was widely misunderstood in too narrow and short-term a way (Mayo 2008) – which presumably is why the first factor that directors are required to have regard to, before the mention of any stakeholders in S.172(1), is “the likely consequences of any decision in the long term.” Thus the Section is consistent (at most) with instrumental stakeholder theory rather than normative stakeholder theory. It seems to resonate well with the UK Stewardship Code,<sup>2</sup> published by the Financial Reporting Council in 2010, the aims of which are to support the efficient exercise of institutional investors’ governance responsibilities and to enhance the quality of their engagement with companies, with a view to improving long-term returns.

The directors are also to have regard to the desirability of the company maintaining a reputation for high standards of business conduct, which seems to imply that the law is seeking to promote good business ethics. Again, this might be considered too vague to have any real impact on behavior, particularly given the reluctance of the courts to challenge directors’ judgment; and it is oriented toward enlightened shareholder value rather than for its own sake (note the reference to “reputation”). Nevertheless, it is interesting for at least two reasons: first, that it should – like various stakeholders – be mentioned at all within company law and second, it reflects a view that, in practice, some UK companies are missing out on opportunities to pursue the “business case for ethics” and hence behaving less well than they might easily choose to do.

Furthermore, there has been some debate about how to enhance the provisions of S.172, including the idea of providing narrative reporting that explains to shareholders and other stakeholders about the implementation of S.172 duties. However, any developments now seem likely to fall short of requiring companies to have worker representation on the board of directors – just as proposals along such lines in the Bullock Report

of 1977 on industrial democracy were not taken up.

## Codifying Corporate Governance

While the law sets the framework for corporate governance – and did so long before the term itself became commonplace – the past quarter of a century or so has seen the growth of a movement to address perceived problems with the governance of companies listed on the stock market. Although shareholder primacy holds in principle in the UK, both incompetence and the kinds of problems highlighted by agency theory can mean that companies are not always run effectively in the interests of shareholders. Following certain “scandals” in the 1980s, such as Polly Peck, BCCI, and the Robert Maxwell affair (Avison and Cowton 2012), corporate governance emerged as a significant issue and led to the establishment of the Cadbury Committee on the Financial Aspects of Corporate Governance (Cadbury 1992). The original report and subsequent developments have been influential in other countries. The UK Corporate Governance Code (as it now is),<sup>3</sup> which is overseen by the Financial Reporting Council, contains broad principles and more specific provisions. Listed companies are required to report on how they have applied the main principles of the Code and either to confirm that they have complied with the Code’s provisions or to provide an explanation – the so-called “comply or explain” approach. This is very much in keeping with the British common law approach, rather than (mainland European) codification – principles rather than rules, substance over form, and the spirit rather than the letter (at least in theory).

The scope of successive versions of the code (or different codes) has broadened over the years (e.g., coverage of risk resulted from the Turnbull Report 1999 on internal control), but it still has a shareholder focus. Nevertheless, in addition to

<sup>2</sup> [frc.org.uk/investors/uk-stewardship-code](http://frc.org.uk/investors/uk-stewardship-code), accessed 02 October 2017

<sup>3</sup> [frc.org.uk/directors/corporate-governance-and-stewardship/uk-corporate-governance-code](http://frc.org.uk/directors/corporate-governance-and-stewardship/uk-corporate-governance-code), accessed 02 October 2017.

influencing corporate governance frameworks elsewhere in the world, the code has also had impacts beyond the listed company sector. Partly because of some recent cases, such as the pension problems arising from the failure of the BHS retail chain, there are discussions about introducing a corporate governance code for the largest privately held companies. Moreover, various types of not-for-profit organization – including charities and universities – have witnessed the introduction of governance codes, especially as they have been encouraged, if not required, to become more professional and “businesslike.”

Finally, in relation to governance, board diversity has become a high-profile issue, for reasons related both to effectiveness (the “business case”) and justice. Much of the focus to date has been upon gender diversity, but there are also signs of growing debate about other forms of diversity, including ethnicity. So far in the UK, there has been resistance to the idea of mandatory quotas, but this is an area in which guidelines and scrutiny, already in evidence, are likely to increase pressure for change.

### Some Current Issues and Influences

The continued evolution of the UK’s company law and corporate governance framework suggests that it is adaptable but also that it is not perfect. Moreover, as explained, it is largely focused on shareholders rather than other stakeholders. However, it should be noted that many stakeholders are covered by other branches of law (employment, health and safety, consumer, environmental, discrimination, etc.). Some businesses will readily uphold or even exceed their legal duties, while others will carelessly or deliberately not do so. This itself is an ethical issue, and so it is not surprising that ethical debate about business at any given time deals not only with issues already covered by legislation or other regulations but also other issues that might be so in the future, depending on the strength and longevity of the criticisms of companies, as well as their response to those criticisms.

Some insight into the current ethical issues is provided by the Institute of Business Ethics’ (IBE) annual overview of major ethical concerns and lapses recorded in its weekly media monitoring. The method used is biased toward large companies – which usually have a code of ethics or similar nowadays – and is dependent upon what the news media are choosing to report. It therefore does not necessarily reflect the issues (both good and bad) relating to SMEs, which are the vast majority of companies. Nevertheless, it is useful as an indicator of at least some of the issues that seem to be of concern in the country; and if the reporting of those issues persists in public media, they are likely to be prime candidates for future regulation or even legislation.

From the 604 different news stories recorded by the IBE in 2016, the most prominent sector (with 156 stories) was banking and finance, which reflects not only its size in the UK but also the scrutiny to which it has been subjected since the global financial crisis. Many of the stories related to financial crime, including insider trading and money laundering. Interestingly, although, in the 2016 edition of Transparency International’s (TI) Corruption Perceptions Index, the UK was ranked 10th out of 176 countries,<sup>4</sup> TI has noted concern about money laundering, which it considers to have been fuelling the boom in London property prices.<sup>5</sup> Considerable attention was also paid in the media stories to executive compensation, especially where packages were considered to be excessive in relation to performance. This comes on top of much bad publicity for banks in recent years; they have had to make major reparation for the mis-selling of personal protection insurance (PPI) policies, interest rate swaps, and endowment mortgages, as well as experiencing the LIBOR scandal.

The retail sector was also prominent in the IBE survey (75 stories), with concern about, *inter alia*, delayed payments to suppliers. Although the UK

<sup>4</sup> [www.transparency.org/country/GBR](http://www.transparency.org/country/GBR), accessed 03 June 2017.

<sup>5</sup> [www.transparency.org/news/feature/property\\_in\\_the\\_uk\\_a\\_home\\_for\\_corrupt\\_money](http://www.transparency.org/news/feature/property_in_the_uk_a_home_for_corrupt_money), accessed 02 October 2017.

now has its third prompt payment code in operation,<sup>6</sup> its voluntary nature and limited take-up seem to undermine its effectiveness. Some retail companies were also criticized for their poor pay and employment conditions, which was one of the four “top” issues across sectors according to the IBE media analysis. (The others were bribery and corruption, fraud, and treatment of customers.) Questionable use of “zero hours contracts” and other practices makes it difficult for some workers to flourish. This possibly reflects some particular features of the UK economy, especially following the global financial crisis.

At the time of writing (late 2017), total employment is at record levels, and unemployment is measured at less than 5% of the workforce. In a time of sluggish growth, this would appear to be a good thing, but the corollary (an arithmetic one, if not a necessary economic one) is that productivity is relatively poor when compared with many other developed economies. To some extent this probably reflects the longstanding problem that a significant section of the population has low skill levels, with technical education and training relatively weak by international standards. However, it might also reflect the relatively high levels of immigration in recent years, with migrants often competing for jobs below their home qualification levels. If the level of immigration does indeed fall significantly post-Brexit, which seems likely, lower paid workers might find their position improved, with more local labor markets clearing at above the National Minimum Wage (introduced in 1999). A report published in 2017, chaired by Matthew Taylor at the request of the Prime Minister, Theresa May, looked at ways in which all work in the economy might be made fair and decent, with scope for development and fulfilment.<sup>7</sup> Whether or not its recommendations have any effect on policy, the review provides a useful summary of the challenges faced by many

workers, which Brexit – if it helps – is unlikely to eradicate completely.

However, it should be noted that not all companies, even in the industries highlighted, are mired in ethical issues. Many excellent companies, both large and small, operate across the economy. In pursuing ethical policies and practices, they face some challenges, but there are various sources of support available to them. Mention has already been made of the Institute of Business Ethics and Transparency International. The UK also has a well-developed network of professional bodies in many fields related to business, whose members are – or should be – expected to uphold higher standards than those required by ordinary morality and the law. A more recent development is that a large proportion of university students study business in some form, and such courses increasingly contain at least some business ethics topics, encouraged by the growing interest of UK business schools in obtaining international accreditation and the increased numbers that have signed up to the UN’s Principles for Responsible Management Education. Such teaching is not necessarily under the heading of “business ethics” though; titles such as “corporate (social) responsibility” and “governance” are also in evidence.

## Conclusion

The UK has a relatively well-regarded business framework that, for reasons of history as much as its strengths, has had considerable international influence. Nevertheless, public debate and criticism indicate several areas of ethical concern, in particular for workers who do not possess highly valued skills. Many of those workers will have voted for Brexit, but whether that leads to an improvement in their conditions remains to be seen.

## Business Ethics Quarterly

Alex C. Michalos

University of Northern British Columbia, Ottawa,  
ON, Canada

## Synonyms

Business ethics journal; Journal on business ethics; Journal on social responsibility of business

## Definition/Introduction

This is a brief description of the official journal of the Society for Business Ethics.

## Description

The first issue of the *Business Ethics Quarterly* (beq) appeared in January 1991, 134 pages of 464 for the full volume. Its basic aim and scope was described by its Editor in Chief Patricia H. Werhane as attracting and publishing “papers on any aspect of the relationship between business and ethics from every disciplinary point of view,” including papers “on methodology and

pedagogy” and “discussion pieces in response to any of the articles published in previous issues” (Werhane 1991).

The idea for the journal occurred to “a number of thoughtful members of the Society for Business Ethics including the past and present Executive Committee: William Frederick, Michael Hoffman, Jennifer Moore, and Lisa Newton. The financial and moral support of the members of the Society...and Loyola University of Chicago...made *BEQ* possible. The work of Al Gini at Loyola has produced the actual copy” (Werhane 1991). Currently, beq is published by Cambridge University Press.

At this writing, 27 volumes in 106 issues have appeared since 1991. The current Editor is Bruce Barry. While the journal has called for and published quantitative analyses, most of its articles have been philosophical with qualitative analyses. In this respect, papers in beq form a good complementary class with the mostly quantitative papers in *jobe*. Many editorial board members of beq have also been members of the board of *jobe* and vice versa. Additional comparisons between beq and *jobe* may be found in the entry for *jobe* in this encyclopedia and in the introductory essay of Michalos and Poff (2013).

## Business Ethics Without Metaphysics

Andrew B. Gustafson  
Creighton University, Omaha, NE, USA

### Synonyms

Cosmopolitan business ethics; Generic business ethics; Nonideological business ethics; Non-religious business ethics; Secular business ethics

### Introduction

Business ethics without metaphysics is essentially the attempt to provide normative rules for business practice and behavior which require few if any explicit metaphysical commitments about ultimate reality. *Business* is essentially the buying and selling of goods and services. *Ethics* typically are rules or guidelines for proper behavior, usually thought of in terms of principles, character traits, or goals for what should or ought to be done or achieved. Business ethics is then the study of what we ought to do when buying or selling goods and services – what kind of behaviors are acceptable, what principles should be followed, what sorts of actions are acceptable or commendable.

*Metaphysics* is the study of what is (or exists) – sometimes referred to as “ultimate reality” – and concepts typically studied in the field of metaphysics would be being (existence), time, space, human nature, and the nature of reality. Metaphysics plays an important role in traditional ethics, because it is frequently thought that one cannot know what we ought to do unless we properly understand what we are. For example, Aristotle famously said that a knife is good and does what it ought if it cuts well, because cutting things well is the proper purpose of a knife. Similarly, good medicine is the sort which leads to health, since the end and purpose of medicine is to bring about health. So it seems, on this view, that we need to know about ultimate reality – the nature of things – in order to come up with any claims about how

things ought to be. So many ethicists believe that any proper ethics must be grounded in a foundational knowledge of ultimate reality – and without such claims about the nature of reality, one cannot arrive at any ethical conclusions.

But there are wide disagreements about ultimate reality. Some think God exists, others do not. Some think things have inherent natures which should be “fulfilled” or actualized, while others do not. Some think we are simply material beings, others think we have a soul. Some think there is an afterlife, others do not. Some believe the world was created, others think it is a product of random chance. Given all these sorts of disagreement about ultimate reality, some have sought to determine some ways of developing ethics without first establishing agreement on those issues. The goal is to find an ethic which is attractive to those who are religious and those who are not, for example, or those who believe there is a God and those who do not.

Given the nature of business – that it is a practice generally carried out in the public realm – it seems it is important for any ethic which would apply in the business realm to be able to speak to people with various worldviews and metaphysical (ultimate reality) beliefs. Thus, the search for business ethics without metaphysics. But if you think that agreement on ultimate reality (metaphysical) questions is essential in order to come to agreement on right and wrong, then this approach to discover business ethics without a common metaphysic appears foolhardy. Yet there are many thinkers who believe one cannot know with any degree of certainty the ultimate nature of reality, so agreement on those points may be impossible. Yet they think ethics are possible and real. This entry will consider ways in which one can develop a business ethic without referring to metaphysics directly.

### Approaches to Ethics Without Metaphysical Agreement

To avoid the debate about the nature of ultimate reality, one popular strategy is simply to set aside that discussion and focus on what our perceptions

of the world are. In other words, you and I may disagree about the nature of the world, but one can at least discuss our perceptions of the world. We agree to bracket the question of ultimate reality and try to come up with common ground at least through our common perceptions. There are a wide number of sources for generating ethical values and principles which do not require an elaborate metaphysical system of beliefs. Below are a few of the various ways to derive ethical values for business without metaphysics.

*Popular folklore and generally accepted opinions:* Fortunately, we find that people often have common experiences of the world, and so, common beliefs and convictions about how we ought to behave. Experiences that we share can help us come to consensus, and we find this in a lot of different ways. Sometimes we experience things ourselves, and other times we learn from others' experiences, or from commonly told folk-wisdom. For example, we generally know that you should not drink gasoline, or stick your hand in boiling water, or lick a frozen flagpole. We know that such things lead to bad results for us. Ethically, we typically know that lying is wrong, one should not be lazy, and it is better to not speak evil about others. One way of gathering such shared experiences is by looking to folklore and traditional stories. Most of us know the story of the boy who cried wolf – when he said false things too often, eventually people would not believe him when he actually needed them to believe him – and things went very bad for him. Or the myth of Icarus, who flew too high and melted his wings and fell to his death – reminding us that over-ambitious plans rooted in hubris frequently end with bad results.

We often seem to just know that certain behaviors are not generally acceptable, and we respect these socially supported viewpoints about behavior. For example, if you stand outside the grocery store and trip old people, laughing at them as they drop their groceries and fall on the sidewalk, most of us will say that you are an awful person. Likewise, when Bernie Madoff lied to friends and other long time customers with his pyramid scheme, society generally found this behavior to be outrageously wrong, without getting into

details of the metaphysical nature of reality. Today almost no one would argue that the slave trade was right or appropriate, and only social deviants would say that human trafficking and sexual slavery are not wrong – regardless of one's religion or metaphysical beliefs.

*Morals by agreement (contractarianism):* Another means of arriving at ethical principles for business practices without a common agreement about metaphysics is contractarianism, the theory that moral agreement in society is the basis of our ethics (Gautier 1986). Some of these rules come to us through customs of society – social norms which are essentially determined by the rational consent of those in the society (Rawls 1971). They mutually agree to offer rights and privileges to all people who will abide by the restrictions and conditions of this social contract. For example, you may have private property, but you must not violate the private property rights of others. You have freedom to do what you want, so long as it does not interfere with the freedoms of others, etc. Such a method of determining ethics does not require metaphysical agreement about God, human nature, or other typical metaphysical disagreements. So in this sense, such a view bypasses those metaphysical differences to come to some common ground of agreement about right and wrong actions.

*Narrative/Pragmatic Ethics:* Some consider ethical discussion and norms as an ongoing way to try to convince others to behave according to the way in which we would prefer things to happen. On this view, it is not that we are trying to “discover the truth” of what is truly ethical, but rather, we are trying to persuade others through discourse and other interactions to live their lives in alignment with what we think would be a practically fruitful way to live (Gustafson 2010). We might do this through helping to sensitize others to effects of particular actions and to refine and expand our ability to relate to the experiences of others. A practical example of this would be to tell stories about the life experiences of others which help us to gain perspective of others and so to be able to sympathize with their view and become more broadminded in how I think about

the world and what should be done in it (Rorty 2006).

*Utilitarianism:* The goal of the utilitarians was to develop a basis for ethics which could appeal to the religious or nonreligious alike – no belief in God was necessary as a starting point for agreeing with their ethics. In fact, their theory was positively agnostic with regard to many questions. The common basis upon which all of ethics was built was the simple fact that we think happiness (defined as pleasure) is good, while pain is bad. From this was derived the basic belief that those actions which lead to greater happiness (pleasure) overall are good, while those which cause greater unhappiness (displeasure) are wrong. Of course various metaphysical beliefs may cause some differences of opinion about what constitutes happiness, but the utilitarian hope is that there can be found common agreement about ends, even if the metaphysical basis and origin of those is in dispute. Management directed by utilitarian ethics keeps focused on long term consequences, and it provides a basis for ethics which can apply to all, while providing a basis for meaningful work and teamwork rooted in justice and fairness, respect for individuals and freedom, and the rights of minority groups (Gustafson 2019).

*Intuitionism:* Moral intuitionists claim that moral propositions are self-evident (Audi 2005). They need no argument to discover basic truths of morality, because they are intuitively obvious to anyone who considers them, and they are not merely feelings, because they are propositions such as “killing is wrong.” This theory avoids metaphysics because it does not concern itself with why these ethical truths are self-evident, it simply points out that all normal people seem to find them compelling, then goes on from there to make moral judgments. This of course is quite efficient, in that it bypasses a lot of arguing about why we should do this and not that. The key hurdle for intuitionists is to decide what should be done when we seem to have two moral intuitions in conflict – such as the moral obligation to save a life, and the moral obligation to not tell a lie. Many intuitionists have worked out elaborate explanations to help determine which rules should supersede other rules under

which conditions. Others have resorted to a view that it is impossible to set out universal principles for making particular judgments, but rather, such judgments require moral wisdom, a feature which is developed over time with sufficient experience (Dancy 2004).

*Market Failures Approach:* The market failures approach is a more recent attempt to derive ethical principles simply from the necessary market conditions for the pursuit of Pareto efficiency (Heath 2014). The basic principles of economics provide the basis for ethical guidance:

the market failures approach takes its guidance from the policy objectives that underlie the regulatory environment in which firms compete, and more generally, from the conditions that must be satisfied in order for the market economy as a whole to achieve efficiency in the production and allocation of goods and services. (Heath 90)

Profit seeking is not the source of unethical behavior – exploitation of market imperfections is what really causes the trouble. If all companies would simply internalize their costs, and charged consumers the full price that the production of their good imposes on society, they would fulfill their social responsibilities as they pursue profit.

*Unmediated obligation to the Other through experience:* Some have argued that our obligations come not through an ethical theory at all, but through a basic and unmediated encounter with “the other” (Peperzak 1996). A vast majority of unethical business practices have been done by an executive or manager who is far removed from the actual person who was affected. When we have immediate encounter with another, we feel a different sense of obligation to this other human, much like we might if we encounter a person who we spoke ill of online through email when we actually meet them in person. When the person is anonymous and impersonal, we do not respect their humanity, but when we encounter them in person, we feel immediately obliged through that experience to respect them and we feel obligation towards them. Overcoming the impersonal distance then, and actually encountering the “Other” is on this view the basis of our moral obligation, not an abstract theory of ethics.

## Conclusion

The pursuit of ethical aims and principles which can guide us in our lives regardless of our religious or other metaphysical commitments is the goal of modern civil society. In business, where professional expectations are to provide ethical aims which are reasonable for all who participate in business practices, it is all the more important for us to find a common basis for ethics which does not first require conversion to a particular religious or metaphysical worldview. While some think such a goal is not possible, many have attempted to provide ethical guidance without or at least with minimal metaphysical commitments.

## Business Ethics, Consumerism, and the Fashion Industry

Rossella Esther Cerchia and Katherine Piccolo  
Department of Private Law and Legal History  
(Dipartimento di Diritto Privato e Storia del Diritto), University of Milan, School of Law  
(Università degli Studi di Milano, facoltà di giurisprudenza), Milan, Italy

## Synonyms

Business ethics; Circular economy; Consumerism; Ethical consumer; Fashion industry; Fast fashion; Sustainability; Textile industry

## Introduction

In this day and age, the pairing of the words “consumerism” and “fashion industry” might trigger a debate on a variety of issues. Although the so-called democratization of fashion – i.e., fashion products at affordable prices, available to almost everybody – might have a positive connotation, fashion consumerism has generally been associated with the formation of an alleged “throwaway society” and the corresponding vicious cycle of incessant production and acquisition of low-cost fashion items. The result is the notorious phenomenon known as “fast fashion” (Muthu 2019). As supply increases and price decreases, a strong consumer culture drives production overseas in search of low(er) production costs. Despite globalization has undoubtedly created jobs in third-world countries, a growing consumer culture has also been affiliated with problems such as high environmental costs, endangerment of animals, exploitation of unskilled laborers, frustration of local artisan textile business, reduction of skilled laborers, and the dependency of governments on foreign investment, to name a few. Presently, the sustainability of the fashion industry is a global challenge: institutional actors, international organizations,

nongovernmental organizations (NGOs), and public opinion are pushing the fashion industry in this direction.

This contribution attempts to provide a very schematic overview of some of the most pressing issues related to fashion consumerism, including its social and environmental impacts, and examples of the global efforts being made to achieve a more ethical and responsible business.

## Global Concerns in the Fashion Industry

### Environmental Impact

The fashion industry causes significant environmental damage. Indeed, it has been accused of being one of the most polluting global industries, next to oil (Jacometti 2019; Muthu 2014; Slater 2003). This is because textile production requires high use of natural resources (e.g., water and energy), often employs toxic chemicals to dye and process fabrics, and is a major contributor to the emission of industrial gasses. Threads must often be treated at high temperatures, and (re-)bleached and (re-)dyed to achieve a certain color before they can be spun and woven into fabrics. In order to achieve a specific texture or flexibility, fabrics must also be washed repeatedly, linking the production process to the deposit of heavy metals (such as cadmium, chromium, mercury, lead, and copper) and sediment in water (Henry and Klepp 2019). Finally, once the finished product is complete, fashion apparel and merchandise must be shipped globally, contributing to growing gas emissions: consider transportation from the supplier to buyer country, from the port of entry to the distributors and/or retailers, and from retailers to consumers (compounded by the frequency and ease of online shopping and special delivery services).

The dark side of fashion is not limited to production and getting clothes to market; after-sales activities (e.g., washing, drying, ironing, and dry-cleaning) are said to have a huge environmental impact (Jacometti 2019). Worse still, production of low-cost garments and accessories is made possible – in part – by the frequent use of poor-quality materials that have a value-retention

benchmark of ten washes. So, because clothes are inexpensive and have an unusually short lifecycle, consumers often do not think twice before discarding them and replacing them with new ones. In 2018, at least 39 million tons of postconsumer textile waste (mainly garments) was generated worldwide, with only 20% of that waste being reused/recycled (Pulse of the Fashion Industry 2017). Therefore, this cycle of increased demand and production translates to a growing amount of solid waste, resulting in the degradation of the quality of earth's physical environment to the point where most of the fashion industry has become unsustainable.

### Endangerment of Animals and Animal Rights

Animal rights abuses by fashion companies have also received much attention. Indeed, horrific stories of live birds being plucked for feathers to be used in down jackets and episodes of violent slaughtering of animals for fur/hides have mobilized animal rights activists against the commercialization of animal products. For example, cruel practices have been reported to shear sheep for wool production, or skin livestock for their leather hides. Comparable reports have additionally advanced the formation of a (growing) fur-free alliance and other animal rights organizations. Reptile skin – for shoes, wallets, belts, and other fashion accessories – is so common that it has been suggested that the fashion industry has driven some species to the verge of extinction (Cavusoglu and Dakhli 2016). If twenty years ago it was *chic* to flaunt genuine leather, exotic skins, or rare furs, labels such as “fair trade,” “Eco,” and “cruelty free” appear increasingly *en vogue*.

### Workers' Rights

Although worker exploitation is common in industries that rely on unskilled laborers (and therefore not limited to the fashion industry), workers in developing countries tend to bear the brunt of the social cost of consumerism in the fashion business.

Affordable fashion encourages companies to move production offshore where expenditures are low, despite the added costs (including

environmental) of transporting products globally. Outsourcing to developing countries has undoubtedly created jobs in countries with high unemployment rates or a weak formal employment sector, but not without raising a number of ethical questions about the impact of doing business abroad. Moreover, business ethics have been questioned as a result of overseas governments becoming dependent on foreign investment, as such governments often do not enact/enforce regulations to effectively improve the standard of living in host countries; many supplier country governments are hesitant to pass legislation that might make them less attractive production hubs. Fast fashion could also threaten the livelihoods of local artisans who practice traditional textile craftsmanship; embroidering machines may be used to cut production costs and consequently eliminate the need for skilled workers. The search for innovative styles additionally encourages designers to incorporate the looks of other cultures, often reinterpreting “traditional textiles” according to Western views – sometimes even misrepresenting or offending foreign cultures (Pozzo 2020).

Moreover, untempered consumption of “fast fashion” puts pressure on factory owners in developing countries to cut costs (whether through specialization or via labor practices), increased specialization contributes to supply chain fragmentation and obscuration, and abusive labor practices may be possible as a result of the highly complex, segmented, and opaque distribution network. And because every link in the supply chain must make a profit, and buyers tend to be the dominant negotiating party, increased fragmentation translates to reduced wages and/or work conditions for laborers. Indeed, the fashion industry has been repeatedly criticized for subjecting garment workers to sweatshop conditions while selling apparel for many times the cost of production.

## Toward More Ethical Business

Given the above, recent years have witnessed the emergence of the so-called “ethical consumer” (Cerchia and Piccolo 2019). Although there is no

uniform definition, the term tends to recall buzz words such as “cruelty free,” “fair trade,” and “organic”. For this type of consumer, it is *à la mode* to patronize fashion brands that respect animal and workers’ rights and that operate according to fair trade and environmental sustainability principles. There has also been a focus on anti-consumption to contrast frivolous consumerism, and ethical consumers have looked to industry trend setters (i.e., luxury brands) to influence consumption patterns by making it unfashionable to be “unethical”, expecting fast fashion brands to mimic responsible behavior (Brewer 2019).

The number of “ethical consumers” who view ethical fashion favorably seems to be increasing, but it is difficult to decipher how this attitude translates into purchasing behavior, and especially whether consumers will spend more for an ethical product. Many contenders in the fashion industry portray themselves as committed to “ethical business” but reports on sustainability in the fashion industry indicate there is still much to be done. The real issue is therefore to distinguish between those companies that genuinely want to be “ethical” and “sustainable” and those that merely aim to appear as such in the eyes of consumers (Cerchia and Piccolo 2019).

The concern that lack of sufficient and/or reliable information is considered one of the primary restraints to achieving a sustainable fashion industry has been addressed in the European Union (EU) and the USA by formal labeling requirements in order to provide consumers with correct and comprehensible information. For instance, in 2007 and 2008, the European Union adopted a political consumer strategy and action plan to improve the quality and quantity of information available to consumers, based on the idea that improved information will enable consumers to change their consumption habits. Again, in 2011, the European Union adopted Regulation EU 1007/2011 to harmonize provisions on the labeling and marking of textile products and to enable consumers to make informed choices. Similarly, in the USA, the US Custom and Border Protection (CBP) and the Federal Trade Commission (FTC) are responsible for the labeling of products, including clothing products.

It has been argued that businesses have an ethical and moral responsibility to safeguard the interests of stakeholders other than shareholders. Achieving a sustainable fashion industry is on the agenda of most legislators (Guenza 2011; Jenkins 2001; Jimenez 2014), international organizations, and recognized authorities. However, in an industry where supply chain is characterized by opacity, fragmentation, and competition between suppliers, it is difficult to align consumer interests with those of the actors involved in the production process – especially when various governments are involved. The legal framework plays a critical role, but the existence of multiple objectives has created a very complex mosaic of legal and non-legal initiatives, including voluntary and self-regulatory tools.

In this context, national legislators regulate risk to environment (e.g., use of hazardous chemicals and pollution) on the one hand, and risk to consumer health and safety on the other (Jacometti 2016).

As concerns risk to the environment, the USA has – for instance – regulated the use of hazardous chemicals since 1976 under the Toxic Substances Control Act (TSCA) (15 USC § 2601 ff). Additional examples of federal regulations that may affect the fashion industry are the Clean Water Act (CWA), which establishes the regulatory framework for the control of direct and indirect discharges of pollutants and the regulation of surface water quality (33 USC § 1251 ff); the Clean Air Act (CAA), which regulates air quality by establishing national emission standards for certain categories of pollutant sources as well as standards for hazardous pollutants (42 USC § 7401 ff); and the Resource Conservation and Recovery Act (RCRA), which subjects facilities that produce, treat, store, or dispose of hazardous waste according to the Environmental Protection Agency (EPA) to specific federal regulations.

In Europe, in 2006, the European Union (EU) passed the REACH Regulation, EC Regulation 1907/2006 to set general limits on the production, import, marketing, and final use of hazardous chemicals within the EU. Other directives to mention are, for instance: the Industrial Emissions Directive (Directive 2010/75/EU),

which aims to prevent and control pollution in the air, water, and land by regulating the production of waste from industrial facilities; the Biocides Regulation (EU Regulation 528/2012), which concerns the sale and use of biocidal products; and the Waste Framework Directive (Directive 2008/98/EC), which establishes a legal framework for the treatment of waste and requires companies to treat waste in a way that protects the environment and human health.

In the USA, risk to consumer health and safety is addressed by the US Consumer Product Safety Commission (CPSC) – under the authority of the Consumer Product Safety Act of 1972 – by, for instance, evaluating consumer products that have been subject of consumer complaints or reports and recalling unsafe products and/or developing uniform safety standards or processes for producers.<sup>1</sup> Although the European Union issued Directive 2001/95/EC on general product safety in 2001, there are no normative Community provisions, meaning product safety is assessed by individual member states, whether through national legislation or nonbinding voluntary industry standards.

Hard law is not the only instrument used to coerce businesses to be more ethical. For example, the majority of national stock exchanges adopt a “comply or explain” policy (and offer a sort of model code of ethics and conduct), urging them to incorporate a code of ethics/conduct into their business. Examples include the New York Stock Exchange, the Australian Stock Exchange, Euronext, the London Stock Exchange, NASDAQ OMX Nordic Exchanges, and the SIX Swiss Stock Exchange. Coincidentally, almost all major fashion companies have a code of ethics or

<sup>1</sup>As regards the fashion industry, 16 CFR § 1120.3 lists drawstrings in children’s clothing amongst the products deemed to be hazardous; 16 CFR § 1501 regulates the use of small parts (such as beads, buttons, and toggles) on children’s clothing; and 16 CFR §§ 1615–1616 require children’s sleepwear to be flame resistant and tight fitting. Moreover, the CPSC requires children’s clothing size 12 and smaller to have permanent tracking labels and undergo a specific certification process, without prejudice to individual states’ authority to adopt more stringent requirements.

internal code of conduct<sup>2</sup> (Cerchia and Piccolo 2019). Moreover, the majority of brands have also established Corporate Social Responsibility (CSR) programs to show their commitment to responsible business practices. In this regard, it is significant that, in 2004, the OECD drafted the Principles of Corporate Governance requiring Boards of Directors to adopt more ethical business practices, in line with the stakeholder theory of corporate governance (OECD Principles of Corporate Governance 2004, p. 24). The United Nations has also promoted CSR through the United Nations Global Compact initiative. Still, despite these instruments' common purpose, codes of ethics/conduct remain voluntary, self-regulatory tools whose legal value is debated. Additionally, absence of a single industry code or standard hinders the progress of the ethical business movement in the fashion industry. Voluntary certifications, international standards, and best practices also play a role in business operations (Jacometti 2016; Brewer 2019).

In connection with the apparent trend in favor of ethical business practices, various actors – including international organizations

and independent third parties – promote more responsible business practices<sup>3</sup> by developing and establishing model codes, international standards, and certification systems. Some examples include the Fair Labor Association (FLA) Workplace Code of Conduct and the Business Social Compliance Initiative (BSCI) Code of Conduct, aimed at providing companies with a system to improve working conditions in the global supply chain. Both the FLA Workplace Code of Conduct and the BSCI Code of Conduct provide a monitoring system with international accredited verification bodies and set out basic workers' rights developed on the basis of the main international standards of worker protection, such as the International Labor Organization (ILO) conventions, the United Nations (UN) declarations, and the Organisation for Economic Cooperation and Development (OECD) guidelines. The US Department of Labor Apparel Industry Partnership (AIP) of 1997 and the Code of Labour Practices for the Apparel Industry Including Sportswear of 1998 provide additional examples of an attempt to unify best practices at an industry-wide level.

Likewise, as disasters such as the collapse of the Rana Plaza have illustrated, the reputational damage caused by an obscure and/or inadequately managed supply chain might also motivate businesses to behave more ethically. In such circumstances, collective agreements are important tools as they facilitate dialogue between various interest groups. Indeed, the global trade union,

<sup>2</sup>Codes of ethics are corporate documents that express the general principles and moral *ethos* by which a company operates; they are to businesses what the Constitution is to a country. Often, corporate codes of ethics also outline basic workers' rights and establish the minimum standards to be observed by the company, its employees, and third parties who enter into contract with the company (e.g., suppliers). Codes of conduct, on the other hand, tend to be more detailed and outline specific behaviors required or prohibited in accordance with principles expressed by a code of ethics or similar statement; they are to codes of ethics what national laws are to a country's Constitution. Although these two documents are, in principle, fundamentally different, their shared function appears to induce scholars and companies alike to use these terms interchangeably. In any case, codes of ethics/conduct vary in length and degree of detail, ranging from single-page documents that may be posted on suppliers' premises to highly detailed sets of provisions that suppliers are contractually required to comply with. This is especially, but not exclusively, true in the case of suppliers operating in developing countries, where the company may be subject to greater reputational risk. Additionally, these codes not only help to raise awareness and encourage fashion companies to comply with basic standards, but they may also be a guide for legislators.

<sup>3</sup>It should be noted that these initiatives focus on more ethical business in general, but as such are applicable also in the fashion industry. The Organisation for Economic Cooperation and Development (OECD) has also been influential in the ethical business movement through, for example: The Foreign Corrupt Practices Act (1977), The Federal Sentencing Guidelines for Corporations (1991), European Parliament Code of Conduct for MNCs Operating in Developing Countries (1999), the OECD Guidelines for Multinational Enterprises (2000), and Combating Bribery of Foreign Public Officials in International Business Transactions (1997). On the fashion industry in particular, see Jacometti 2016 (available in Italian) for a detailed discussion of the practical and legal problems associated with international standards and certification systems in the fashion industry, as well as enforceable national and supranational provisions in the USA and Europe.

IndustriALL, has liaised with global fashion giants and industry actors to generate collective agreements in Asia and Bangladesh with the aim of achieving fairer wages and eradicating unfair practices in textile factories.

Finally, the current abundance of used clothing that ends up in landfills and unsustainable exploitation of natural resources calls for the creation of a “circular economy” (Jacometti 2019). Namely, such a model would reduce the frequency at which new garments are produced and thrown away, and change the idea that fashion is fully disposable. In this context, if textile waste is a pressing global concern, the most important aspect of the circular economy model might be instilling the notion – in consumers and producers alike – that waste is a resource and not a liability (Masieri 2018). In this regard, it is noteworthy that Europe, the USA, and Australia and others are working to achieve – amongst other things – a more efficient waste management system. The European Union has adopted the European Clothing Action Plan (ECAP) to divert over 90,000 tons of textiles away from landfills by 2019 (European Green Capital 2020); the EU Circular Economy Package 2018 supports this effort by setting five-year goals (effective from 2020) to reduce and recycle waste (including textile waste), and the EU flagship initiative on the garment sector aims at improving issues such as traceability and transparency in the supply chain (European Parliament 2017). Moreover, on March 11, 2020, the European Commission adopted a new Circular Economy Action Plan to create a strong, competitive green economy by involving both businesses and stakeholders (Press Corner European Commission 2020). Conversely, the USA has no federal law that mandates recycling: waste is managed through the US Environmental Protection Agency (EPA) under the 1976 Resource Conservation and Recovery Act (RCRA), which encourages individual states to create comprehensive waste management plans. It is therefore not surprising that private enterprise is responsible for promoting the circular economy in America. In fact, private textile recycling enterprises employ more than 17,000 people to process used garments and keep approximately 2.5 billion pounds of

postconsumer textiles out of landfills each year. The Council for Textile Recycling has also been instrumental in creating a network of individuals and organizations dedicated to improving the lifecycle of garments, and, in 2019, the US Chamber of Commerce Foundation hosted its fifth Annual Sustainability and Circular Economy Summit where hundreds of professionals and stakeholders gathered to discuss issues surrounding sustainability priorities. Similarly, Australia has included elements of a circular economy in its system, including through its National Waste Policy (which provides a collaborative network between government, businesses, and industry) in order to adopt specific solutions based on particular local and regional circumstances (National Waste Policy 2018).

## Conclusion

Consumerism may be defined as a cultural attitude that views the acquisition of goods as a vehicle for economic growth, improved standards of living and personal fulfillment. Although intended to have a positive connotation, consumerism has been associated with the formation of a so-called “throwaway society” in which accomplishment is measured by material possessions and the frivolous disposal of used goods. As concerns fashion, consumer culture has led to market demand for good-looking attire and accessories at affordable prices, resulting in a vicious cycle of incessant production and acquisition of low-cost fashion items. Consequently, current mainstream business models encourage offshore production and rely on high-volume sales of cheap goods. The combination of such business activity has resulted in the “fast fashion” phenomenon, and all the ethical problems that come with it.

Sustainability of the fashion industry is a major global concern. The business context is marked by multi-stakeholder initiatives. If the global fashion industry is threatened by unethical business practices and untempered production, it is also true that much progress has been made toward becoming a more responsible industry. Still, it is difficult to align the interests of the various actors involved.

The above-mentioned initiatives seem to reinforce what behavioral economics studies have already demonstrated: consumer choices are not motivated solely by individual considerations relating to the relationship between quality and price. When applied to the fashion industry in particular, studying how this (inadequate) cognitive model is applied by mainstream fashion brands highlights the fact that so-called “ethical choices” are those made according to individual values. However, it appears that fast fashion places such ethical choices in the dimension of “persuading” and not in the dimension of cognitive “truth.” Thus, the ethical consumer acquires regulatory legitimacy by acting on two fronts: as a source of pressure on fashion producers (through a sort of reputational threat), and by inducing national or supranational regulators to issue binding provisions (including fiscal ones) to protect interests that lie outside the production cycle (including those of sentient animals).

By adopting a multifaceted approach, the hope is that more and more consumers will change the way they view fashion to the point where it becomes both politically savvy and economically beneficial to be more sustainable and ethical.

## Business Ethics: A European Review

Alex C. Michalos  
University of Northern British Columbia, Ottawa,  
ON, Canada

### Synonyms

European business ethics journal; European journal on social responsibility of business; Journal on business ethics for Europeans

### Definition/Introduction

This is a brief description of the origins of *Business Ethics: A European Review*.

#### Definition

The first issue of *Business Ethics: A European Review* (BEER) appeared in January 1992, 72 pages of 271 for the whole volume. As of May 2017, there have been 26 volumes in 102 issues. Its first editor was Jack Mahoney, who held the job for 7 years. Its current editor is

Dima Jamali. It is published by John Wiley & Sons Ltd. and features “editorial interviews, book reviews, comments and responses to published articles, research notes and case studies.”

The mission statement of BEER was described by its editor as a journal aimed to concern ourselves and our readers with ...questions about what makes a business company ethical and what makes for ethical business...The conduct of business is an honourable occupation which is demonstrably capable of adding value to the quality of human living in society. We aim to contribute to that positive enterprise. ... (Mahoney 1992).

Precise means of making that contribution included:

providing a forum for business people to exchange experience of ethical challenges to business and their solutions; offering informed analysis and discussion of ethical issues encountered by directors, managers and others; promoting good ethical thinking, policy, and practice, at corporate and individual levels; and commenting on current issues and developments relevant to the ethical conduct of business. (Mahoney 1992)

The introductory editorial thoughtfully remarked that while the question “What makes a company ethical?” can be answered by contemporary fashion, law, and the fear of being punished, social pressure by a variety of stakeholders, the simplicity of honesty, or the fact that often enough “it pays to be ethical”; the correct answer lies elsewhere. “Irrespective of fashion, pressure, or profitability,” the editor wrote, “there are certain ways of behaving, for a company as well as for the individuals in it...the ‘pure’, perhaps ‘purist’, approach to ethics in business views ethical business conduct as important in its own right, and not just as a means to securing some other goal.” He was particularly critical of the idea of the so-called business case for business ethics. In his view, as with Cicero’s 2,000 years earlier, “If ethical business is justified by the bottom line, then when the crunch comes – or the recession – comes, ethics may find itself among the cuts made as a luxury which a company or an individual cannot afford.”

## Business of Boycotting

Mark C. Vopat and Alan E. Tomhave  
Department of Philosophy and Religious Studies,  
Youngstown State University, Youngstown,  
OH, USA

## Synonyms

Blackball; Exclude; Ostracize; Sanction; Shun

## Introduction

Although a frequently employed practice, little has been written on the ethics of boycotting. One article, *The Business of Boycotting: Having Your Chicken and Eating It Too*, by Alan Tomhave and Mark Vopat, explicitly addresses the issue (Tomhave and Vopat 2018). In their article, Tomhave and Vopat argue for the moral impermissibility of some, but by no means all, boycotts. In large part, Tomhave and Vopat are responding to the view of boycotts expressed by those like Murray Rothbard that boycotts are always per se morally acceptable, because they do not involve coercive force (Rothbard 1998). Unlike Rothbard, Tomhave and Vopat hold that the question of whether boycotts are coercive is not a settled issue. They claim that there are two initial

questions that need to be answered, “First, are boycotts coercive? . . . Second, are there instances of boycotting that would fall into an unjust use of coercion” (Tomhave and Vopat 2018)? The answer Tomhave and Vopat give to both these questions is yes. Boycotts are coercive, and there are some cases of boycotting where the use of coercion is unjust. According to Tomhave and Vopat, in order to determine when a boycott constitutes an unjust use of coercive force, it is necessary to make a distinction between two types of boycotts: a personal boycott and an organized boycott. It is only boycotts of the latter type that raise moral issues.

## Types of Boycotts

Personal boycotts are simply personal decisions to refrain from engaging with a certain organization. Such boycotts on their view are not morally problematic as there is no moral obligation to do business with any particular organization. A personal boycott may be engaged in for any number of reasons (even reasons that may be morally problematic – like a desire to not associate with certain racial groups). A personal boycott is a refraining from action. On the other hand, organized boycotts, the type that concerns Tomhave and Vopat, are calls for others to join you in a boycott of a particular organization. Such boycotts are always coercive, and that use of coercive force is sometimes unjust.

## The Argument that Some Boycotts Are Morally Wrong

The basic argument offered by Tomhave and Vopat defends three claims to support the conclusion that some boycotts are pro tanto morally wrong. The first claim is simply that boycotts are always coercive. They establish this claim by defending a morally neutral account of coercion. For them, coercion is simply the threat to make some worse off unless they follow the desires of the coercer. Tomhave and Vopat state, “The call

for an organized boycott is a call for a use of a kind of force, which is, using the threat of economic loss to compel an individual or company to change a belief or practice” (Tomhave and Vopat 2018). The assertion is that this is a standard analysis of coercion, and if true, then boycotts are by their nature coercive. Because they defend a morally neutral account of coercion, it is not enough to establish that boycotts are coercive. They must then establish that the coercion is, in some cases, unjustified, and thus the boycott itself is morally wrong.

The second claim that Tomhave and Vopat defend is the empirical claim that boycotts are sometimes intended to change the actions of organizations or individuals; while at other times, they are intended to change or silence the ideas held by those organizations or individuals. Regardless of the intent – the changing of actions or the changing or silencing of ideas – either requires moral justification for the use of coercive force.

The final claim that Tomhave and Vopat defend is that the use of coercion in the marketplace of ideas is always morally problematic. Ideas under examination in the market place of ideas should stand or fall based on the arguments offered about the positions, and not by forcibly silencing those suggesting the ideas. In defending this claim, the argument rests heavily on John Stuart Mill’s *On Liberty* (Mill 2010). Additionally, in making this argument, they make a distinction between consequential acts and expressive acts, which helps limit the scope of their argument. Though this distinction is not always clear, consequential actions are those which might be legally or morally wrong, while expressive acts are expressions of certain beliefs, attitudes, or views on a subject or issue. Tomhave and Vopat argue that organized boycotts as a response to expressive acts are morally problematic.

Putting the above ideas together amounts to a relatively simple argument. The use of organized boycotts to change or silence the beliefs or ideas of others is tantamount to coercing people into changing their beliefs. It would, they argue, be like threatening someone to make them accept your religious beliefs. No one would count such

coercion as justified. Yet an organized boycott targeting an expressive act is essentially doing just that. The offer of argumentation and discussion to get someone to change their minds is one thing – it is the way the marketplace of ideas works – the use of coercion is a different story.

Consequential acts are different. These are acts that have an impact on people in a more robust way. In such cases, the coercion of an organized boycott might be justified. However, it should be noted that a boycott is not automatically justified when it targets consequential acts. For example, if the boycott would actually cause more harm than good, Tomhave and Vopat would deny its permissibility. In this way, their position is consequentialist when considering organized boycotts of consequential acts. It is not just the consequences of the actions of those boycotted that need be considered, other factors such as who will be harmed by the boycott, and whether or not it will be effective must be taken into account on their view.

The position advocated by Tomhave and Vopat is only simple in theory. They admit that most real cases will be much messier than their analysis makes it sound. While the distinction between consequential and expressive acts appears straightforward, it is clear that there are expressive acts that have a consequential impact on others. Similarly, there are also expressive acts that serve to advocate for policies which themselves may harm individuals and thus blur the line between the two types of acts. This means that in practice, the decision on whether or not a boycott is morally justified will be far from simple to determine.

## Introduction

The dichotomy between business and law has played an important role in the establishment of business ethics, both as a study and a practice. In the past, the dogmatic adherence to the shareholder primacy theory of corporate governance has resulted in managers pursuing economic profit without regard for ethical implications of their conduct or consequence on stakeholder interests. Reports of events such as industrial accidents, corporate bribery, and workers rights' violations sparked concern for the impact of business activity and, implicitly, the rules that guided the behavior of corporate decision-makers.

On the one hand, national governments have sought to contain the negative consequences of business with country-specific laws aimed at protecting the natural environment, safeguarding vulnerable categories of people, and boosting investor and public confidence in business. On

the other, pressure from international organizations and consumers appears to have essentially driven businesses to adopt codes of ethics to communicate corporate commitment to social and environmental issues (Cerchia and Piccolo 2019).

## Business and Law

Regarding the former, in America, initiatives such as the Clean Air Act of 1963; the National Environmental Policy Act of 1969 (which led to the creation of the Environmental Protection Agency of 1972 aimed at protecting the environment); the Federal Water Pollution Control Act of 1972; and the Toxic Substances Control Act of 1976 required businesses to rethink production processes, including the substances used in production, as well as waste disposal practices.

The Equal Pay Act of 1963; the Age Discrimination in Employment Act of 1967; the Occupational Safety and Health Act of 1970; the Employment Opportunities for Disabled Americans Act of 1986; the Family and Medical Leave Act of 1993; and the Americans with Disabilities Act of 1990 have also affected a range of corporate (human resource) policies.

As concerns laws to improve transparency and deter unethical business practices, the Foreign Corrupt Practices Act (FCPA) of 1977; the 1991 Federal Sentencing Guidelines for Organizations (FSGO); and the Sarbanes-Oxley (SOX) Act of 2002 illustrate a trend to promote an organizational culture of compliance and ethical behavior. In particular, the FCPA outlawed bribery of foreign government officials by US corporations. The FSGO- as an extension of the Sentencing Reform Act of 1984- describe the elements of a corporate ethics program required to benefit from a reduced sentence if convicted of criminal activity, and the SOX introduced codes of ethics as a requirement for publicly traded companies. Moreover, it is significant that the Federal Sentencing Guidelines for Organizations were amended in 2004 to entail effective compliance and impose more stringent requirements.

In response to consumer complaints about greenwashing, the Federal Trade Commission

revised its so-called “Green Guides” (or “Guides for the Use of Environmental Marketing Claims”), which essentially interpret Section 5 of the Federal Trade Commission Act (FTC Act) as applied to environmental marketing. Many states have also enacted laws to protect consumers from deceptive or misleading business practices, and common law generally recognizes greenwashing claims as part of a fraudulent misrepresentation and/or breach of warranty claim.

Likewise, in Europe, the process of legislative reform in favor of more responsible business practices apparently began with protection of the natural environment and workers’ rights. For example, French Law Nos. 61-842 of 2 August 1961 and 64-1245 of 16 December 1964, and the French Water Act No. 92-3 of 3 January 1992; the German Technical Instructions on Air Quality Control (TA Air), 1964, Federal Immission Control Act (BImSchG), 1974, and the German Sustainability Code of 2011; and the UK Clean Air Act 1968, the Environmental Protection Act 1990, the Clean Air Act 1993, the Environment Act 1995, the Waste Minimalisation Act 1998, and the Pollution Prevention and Control Act 1999 focused on protecting air and water quality. Currently, Regulation (EC) No. 1907/2006 (REACH) aims to improve human health and the environment by restricting the use of certain types of chemicals.

As concerns workers’ rights and labor law, the German Act on Collective Agreements of 25 August 1969 (last amended 29 October 1974) improved labor guarantees already recognized under the German Constitution of 1949. Additionally, French Law No. 73-4 of 15 August 1975 and Italian Law No. 300/1970 (the Workers’ Statute) generally provided protections against dismissal and discrimination in the workplace and recognized various of other relevant workers’ rights; the French “Auroux Laws” of 1982–1983 recognized workers’ collective bargaining power, and Italian Laws Nos. 108/1990, 223/1991 and 125/1991 have improved protection of workers’ rights against unfair dismissals. Furthermore, in the UK, the Contracts of Employment Act 1963; the Redundancy Payments Act 1965; the Equal Pay Act 1970; the Trade Union and Labour Relations

Act 1974; the Employment Protection Act 1975; the Employment Acts of 1980, 1982, 1988, and 1990; the Trade Union Act of 1984; and the Modern Slavery Act of 2015 provide significant examples of a heightened sensitivity to workers’ rights issues.

Bribery and corruption also became a public concern. Beginning in the 1990s, the European Commission adopted the first European anti-corruption standards and conventions (e.g., Article 83 TFEU recognizes corruption as a “euro-crime,” and the 1997 Convention on fighting corruption involving officials of the EU or officials of Member States). More recently, the 2003 Framework Decision on combating corruption in the private sector prohibits both active and passive bribery, and EU Directives 2015/849 and 2018/843 were adopted to fight against money laundering.

Similar to the Sarbanes-Oxley Act, European Directive 2006/46/EC introduced codes of ethics as a requirement for publicly traded companies, and the act of greenwashing is (at least indirectly) governed by Directive 2005/29/EC and various national consumer codes. The 2011 Green Paper on Corporate Governance and the EU Action Plan on Human Rights and Democracy 2015–2019 also collectively require European corporations to significantly consider stakeholder interests when carrying out business operations, including when choosing business partners. Finally, related to reporting issues of CSR initiatives and the risk of greenwashing, Directive 2014/95/EU regulates how public companies should disclose non-financial information (such as efforts made in compliance with CSR programs, often included in or linked to corporate codes of ethics) in their annual reports.

The international community has additionally been instrumental in promoting more responsible business practices through various agreements, treaties, conventions, guidelines, and standards. To name a few: The Universal Declaration of Human Rights, numerous ILO conventions, the UN Guiding Principles on Business and Human Rights, the OECD Guidelines for Multinational Enterprises, the UN Global Compact, and various ISO standards (including ISO 26000, ISO 45001, and ISO 9001).

In a nutshell, there is an apparent trend to compel businesses to be more values based.

## Codes of Ethics (and Law)

At face value, the above efforts appear to have successfully driven corporations to consider stakeholder interests as part of the general corporate interest. Indeed, phrases such as “doing good by doing well” and the “triple bottom line” have become popular slogans. Likewise, codes of ethics represent one of the ways businesses express their commitment to issues consumers care about (Cerchia and Piccolo 2019) and have undeniably become part of “business as usual.” For instance, failure to adopt a sufficiently detailed code could result in denial of access to credit and/or funding as rating agencies consider both financial and nonfinancial factors (including management and corporate governance attributes) when determining a company’s default risk and credit profile. Compliance with a commercial partner’s code of ethics is also often incorporated in trade agreements (Beckers 2018, pp. 48–49; McBarnet and Kurkchiyan 2007; Vytopil 2015) such that respect for the provisions set out in the relevant code become an express contractual obligation. Against this background, it seems significant that the majority of US and European corporations have adopted public codes of ethics, and current research suggests there are at least 100,000 parent company MNEs operating worldwide, with more than 890,000 subsidiaries and millions of suppliers (Jaworek and Kuzel 2015).

Still, voluntary codes do not appear to have eradicated the occurrence of corporate misconduct or made industry more sustainable. Rather, news of corporate malice and/or negligence – such as the August 2006 shipping disaster (in which chemical waste was discharged around Abidjan, Côte d’Ivoire); the BP Deepwater Horizon oil spill in April 2010 (in which 4 billion barrels of oil hemorrhaged over a period of 3 months in the Gulf of Mexico); the Tazreen fire in 2012; the Dhaka fire and Rana Plaza disaster in 2013; and the Tamboco and MultiFabs factory fires in 2016 and 2017 – suggests that the

ethical problems associated with uncontrolled business that urged Western legislative reform from the 1960s through the 2000s have simply moved abroad.

If it is true that Western legislation is more-or-less effective at deterring offenses on national soil, efforts to hold corporations accountable for ethical violations becomes more complex in situations where the “links” of the supply chain are located in foreign jurisdictions.

More specifically, the doctrines of separate legal personality and the *forum non conveniens* often bar claimants from suing companies in their home jurisdiction for indirect involvement in transgressions occurring abroad. And even in cases where jurisdiction is assumed by a foreign court, according to the rule of *lex loci actus*, the applicable law will often be the law of the country where the harm occurred. Consequently, in the particular context of global supply chains, remedies actually available to aggrieved parties tend to be inadequate.

The challenges surrounding the liability of multinational corporations have induced part of the doctrine to construct self-regulatory instruments as more than mere corporate governance tools. For instance, some argue that the prevalence of corporate governance codes suggests the emergence of a system of non-state law that requires compliance with the provisions set out therein (Teubner 2011; Beckers 2018, p. 26, nt. 110). This view highlights the prevalence of codes of ethics, the impact of model codes, and the affinity for standardization of code content as well as the wide-spread incorporation of international and specific industry standards. Moreover, to the extent that adoption of a code of ethics represents a “best practice,” in the event of an inadequate or absent code of ethics, courts may establish liability based on the contents of the codes of other companies operating in the same sector or having the same characteristics (Benatti 2015, p. 249).

It has also been submitted that corporate codes create binding obligations under contract law for the party to whom the code of ethics is attributable, whether because the provisions of the code create reasonable expectations regarding products’ characteristics, because they relate to a

company's commercial practices, or because they essentially constitute unilateral promises to the public in general and third-party beneficiaries in particular (Beckers 2018; Revak 2011). However, as establishment of a contract depends on a variety of factors – including intent to be bound, consideration, and reliance, the interpretation of which are influenced by the specific formulation of the provisions and the manner in which the code is implemented – corporations may successfully address issues that are important to consumers without employing language that might be construed as intent to create contractual relations. Alternatively, a corporation may adopt a detailed code of ethics that goes unenforced or is ineffective. In this case, weak monitoring mechanisms could undermine a third-party's reliance on commitments pledged within a corporate code.

Given apparent inapplicability of contract law in cases in which damage arises in connection with a violation of a corporate code of ethics, invoking the principles of tort law may be useful to establish when the dominant party in a business relationship owes a duty of care to third-parties. Still, this is not a straightforward task. Traditionally, it has depended on the three-stage test set out in *Caparo Industries plc v Dickman* [1990] 2 A.C. 605 (HL); in particular, the foreseeability of harm, the degree of proximity between the parties, and whether the imposition of liability may be considered fair, just, and reasonable. In this context, *Chandler v Cape Plc* [2012] EWCA Civ 525, represents a landmark case as it recognizes courts' discretion to consider a variety of elements that might provide grounds for the establishment of a duty of care. Thus, notwithstanding contractual arrangements (e.g., the requirement to adhere to a buyer's code of ethics) and material facts (e.g., the percentage of a supplier's sales that derive from its relationship with a specific buyer) could become relevant in determining whether a duty of care may be established, it could be difficult to apply the doctrine in polycentric corporations where different legal entities exercise control functions.

Although not directly involving codes of ethics violations, case law traditionally highlights a

general reluctance of courts to impose a duty of care without clearly defined legal rules.

In the USA, beginning in 1980 with the landmark decision *Filartiga v. Pena-Irala*, 630 F.2d 876 (2d Cir. 1980), US courts began interpreting the Alien Tort Statute (ATS) to hold corporations liable for their foreign activities. Since *Filartiga*, however, the application of the ATS has been controversial; *Nestlé USA, Inc. v. Doe I*, et al., 593 U.S.\_\_\_\_ (2021) and companion case *Cargill, Inc. v. Doe I*, 593 U.S.\_\_\_\_ (2021) illustrate the tendency for US courts to narrow the application of the ATS as well as a general reluctance to pierce the corporate veil or create clear criteria for establishing liability.

Similar actions have been brought in the UK (e.g., *Connelly v RTZ Corporation Plc* [1998] AC 854; *Lubbe v Cape Plc* [1998] CLC 1559 (CA); [2000] 1 WLR 1545 (HL)). Recently, in *Vedanta Resources PLC and another v Lungowe and others* [2019] UKSC 20 April 2019, despite the UK Supreme Court affirmed the potential liability of English parent companies in relation to the activities of their subsidiaries (noting that liability depends also on the extent of and manner in which the parent controls, supervises, or advises on the relevant operations of the subsidiary), the action could not ultimately proceed due to application of the doctrine of *forum non conveniens*.

A recent decision (*Nevsun Resources Ltd. v. Araya*, 2020 SCC 5) of the Supreme Court of Canada could, however, represent a turning point. Specifically, the Supreme Court of Canada ruled that: “as a result of the doctrine of adoption, norms of customary international law...are fully integrated into, and form part of, Canadian domestic common law, absent conflicting law...[and]...like all common law, no legislative action is required to give them effect” (par. 94). This Court also implicitly responded to arguments that corporations are not subject to international law, noting that some rules of customary international law “prohibit conduct regardless of whether the perpetrator is a state” (par. 105) and therefore concluded “it is not ‘plain and obvious’ that corporations today enjoy a blanket exclusion under customary international law from direct liability for violation of ‘obligatory,

definable, and universal norms of international law,' or indirect liability for their involvement in ... 'crimes of complicity'" (par. 113).

Nonetheless, to the extent *Nevsun Resources Ltd. v. Araya* is applicable outside of Canada, it hardly resolves procedural or culpability issues in civil law jurisdictions.

Within this framework, the law does not appear to have adapted to social expectations or the changing perspective of corporate responsibility. Indeed, various governments have enacted legislation that could be instrumental in imposing a duty of care throughout supply chains.

For instance, in the USA, the California Transparency in Supply Chains Act of 2010, Cal. Civ. Code § 1714.43 imposes disclosure requirements on manufacturers and retailers regarding monitoring of supply chains for potential human rights abuses. In 2010 and 2012, through the Dodd-Frank Wall Street Reform and Consumer Protection Act and Section 1502 of the US Securities and Exchange Commission (SEC), respectively, companies were required to perform due diligence on their supply chains in compliance with annual and quarterly disclosure requirements for externalities and corporate activities impacting stakeholders. In July 2019, a bill of the Corporate Human Rights Risk Assessment, Prevention, and Mitigation Act of 2019 was introduced in the US House of Representatives. If passed, publicly traded companies will be required to provide the SEC with information on human rights risks and impacts, as well as details of human rights due diligence.

In the European context, Directive 2014/95/EU and national reforms occurring between 2016 and 2017 (e.g., the 2016 Italian Action Plan on Business and Human Rights; the 2016 German National Action Plan for Legislative Reform; the 2017 French National Action Plan) appear connected to the March 2017 proposal by the UK Parliament's Joint Committee on Human Rights to pass legislation that would impose a duty of care on all companies to prevent human rights abuses and allow for civil remedies against the parent company in the event of abuse (House of Lords 2017), as well as the 2019 German Draft Law on Corporate Due Diligence to Prevent

Human Rights Violations in Supply Chains, the French Loi No. 2017-399 of 27 March 2017 (the "Duty to Supervise" law) and the 2019 French "Pacte Statute."

## Conclusion

At the same time, it has been argued that audits codify and legitimize poor social and environmental records, shape state approaches to supply chain governance, and contribute to growing trust in metrics that conceal real problems in global supply chains (LeBaron and Lister 2015). Moreover, increased reliance on corporations to self-regulate – and trust that they will accurately report on their efforts – leads to a persistent decline in objective monitoring of the supply chain (Terwindt et al. 2017, p. 266). Thus, although compliance with reporting obligations might create the appearance that companies are taking meaningful action, as long as corporate codes of ethics remain unenforceable corporate governance tools, effective protection of public interests remains precarious. Therefore, lawmakers must exercise caution not to overregulate and ultimately make compliance so cumbersome that businesses, consumers, and investors alike lose sight of the ultimate goal.

## Capitalism

Thomas F. Phillips  
Trent University, Peterborough, ON, Canada

### Synonyms

Free enterprise economies; Free market economies

### Introduction

Capitalism can be described, in simple terms, as *a social system of production and distribution, dominated by markets*. There are three important parts to this description. First, capitalism is a *social system* (not a natural, physical, or biological system) that has formed through the collective actions of people striving to ensure that they, and their family and community, have the material means to survive. Second, the survival of a society has been dependent upon its ability to *produce and distribute*. That is, humans have tended to act collectively (rather than individually) to put social systems in place that allocate the responsibilities of production and distribution in such a way that ensures their material reproducibility beyond a single generation. Finally, in capitalist societies, this is done through *markets* – where buyers and sellers meet to engage in exchanges that, at the very least, sustain them.

While creating a *social system of production and distribution* is central to a society's success, it is only over the past few centuries that society has been *dominated by markets*. For most of the human experience, *social systems of production and distribution* have been dominated by command (i.e., the rule of a leader or an organized group that is responsible for the survival and sustainability of the community) and tradition (i.e., actions that are deemed by the community to be the proper, ethical ways to ensure the success of the community that have been proven over time – across generations).

Capitalism is dominated by markets; however, there remain aspects of command and tradition within it. The key point is that markets play the *dominant* role in organizing production and distribution in capitalism. Similarly, societies that are, or have been, dominated by command and/or tradition may have markets; however, markets are on the fringes of society – not playing a dominant role. While markets on the fringes of feudal society facilitated trade in surplus goods (i.e., in excess of the needs of the community), markets in capitalism are pervasive, especially since they include markets for land and labor.

In capitalism, it is through markets that society provides for its material well-being.

### Historic Roots

The process that led to the capitalist societies was evolutionary, rather than revolutionary. The result

of this evolution has been described, by some in hindsight, as revolutionary; however, the process occurred over about 300 years. The social evolution that led to capitalism was not an organized political movement, rather a series of social circumstances that led to people moving, often not of their own free will, from a society dominated by command and/or tradition to one where markets were more common – eventually becoming dominant. For instance, those in feudal Western Europe who plied a trade as a service (not earning a wage but receiving everything needed to sustain themselves and their family) to the lord (or landlord) could find themselves without the means to provide for themselves and their family once they were forced out of the security of their feudal community. They survived by selling their skills and labor in return for the ability to buy what they needed to meet their material needs. From this social necessity came two basic markets that people of that time had not encountered before: pervasive markets where goods and services were bought and sold and a market in which they could sell their labor. In societies dominated by command and/or tradition, one's own labor was a social resource used in the interests of the community – not “owned” by the individuals themselves.

As mentioned above, before capitalism became common, markets existed on the fringes of societies dominated by command and/or tradition – precapitalism. Merchants and feudal landlords coexisted where the landlords played the dominant social role. Landlords controlled rural communities, large and small; merchants played much more central roles in cities and in international trade. Mercantilism dominated international trade (i.e., international markets), while traditional, feudal society dominated most people's rural, domestic lives. From the sixteenth century through to the mid-eighteenth century, there was a movement of people from rural settings to cities and a shift in social power from landlords to merchants. Naturally, this led to markets playing a more central social role than they had. Capitalism has clearly evolved into the world's dominant social system of production and

distribution; however, in broad, historical terms, it is a very new social system (Polanyi 1944).

To put capitalism in historical perspective, Robert Heilbroner offers the idea of “an immense historical atlas that the thousands of recognizably different societies in human history, all of which have coped with producing and distributing the wherewithal for their continuance. In this atlas the societies in which we will recognize the telltale characteristics of capitalism are but a tiny handful, grouped in the last pages of the book. . .” (Heilbroner 1992, 9).

Contemporary capitalism and its dominant class – described as capitalists – tend to come in various forms; however, each form contains basic, common characteristics.

## Orthodox Capitalism

There are several, well-developed economic models of capitalism. Neoclassical economics is the most generally accepted model, the mainstream, orthodox view that is the economic focus of neoliberal and libertarian perspectives. Its roots are in utilitarian individualism, where people behave in common ways: self-interested, rational ways. In markets, buyers and sellers act according to the same utilitarian principles. Consumers maximize their utility (i.e., their self-satisfaction); producers maximize their profits. Markets facilitate mutually maximizing behaviors. Aggregating the self-interested actions of the “agents” leads to, according to neoclassical theory, “socially optimal results.” Of course, there may be circumstances when the benefits of markets are not able to lead to socially optimal results (i.e., “market failure”). When this occurs, government needs to represent society's interests by creating an economic environment in which the socially beneficial actions of the “agents” can be expressed (Marshall 1890; Samuelson 1947).

While capitalism has been associated with growing affluence, technological innovation, etc., it is also associated with inequality (e.g., in income, opportunity, and wealth), the commodification of everything (e.g., water, air, outer space), consumerism, and environmental degradation.

With the neoclassical view being vastly theoretical, capitalism must be considered in light of the social realities of contemporary capitalism.

## Critique of Orthodox Capitalism

### The Two Domains: Social Roles, Values, and Ethics

With its origins in feudalism (command and tradition) and mercantilism (trade), capitalism has retained aspects of both. All forms of capitalism require, by necessity, two dominant domains: a public domain (with its roots in command and tradition) that is the responsibility of government and a private domain where markets play their central role. At a high level, governments represent the social/collective interests, whereas markets represent private interests. At a more meaningful level, the public domain represents the foundation upon which the private domain is built.

Capitalism is dominated by markets, and markets are where, by definition, goods and services are traded – where they change hands from seller to buyer through a market transaction. Before a trade can occur, something must be determined; it must be clear that the seller owns what they are offering to sell. Therefore, for an exchange to occur, somehow a generally accepted social institution must be able to establish ownership *before* the trade can occur, and it must establish new ownership once the transaction has taken place. This can only be done by a social institution that has no vested interest in the trade – which represents every buyer and every seller.

Government represents the public's interest in seeing that markets function ethically. Establishing ownership and its transfer in a transaction (today commonly done through a receipt provided by the seller indicating that ownership had been transferred at the time of the transaction) is central to the viability of markets. The underlying requirement of exchange is a role for government that is necessary in advance of the arrival of a society dominated by markets. While many believe that capitalism is built on private interests,

in fact, it is built on a public, governmental, foundation.

Publicly recognized contracts are also a necessary feature of markets. A contract is, in effect, a promise made by one party to another. If that promise is not fulfilled, there must be some socially determined, generally accepted, form of recourse. The nature of contracts and their enforcement are other facets of the public foundation upon which private markets sit.

The basis of ownership (being able to sell only those things that you own) and contracts (people must fulfill promises made) reflects social values. That is, for a social system dominated by markets to serve everyone's interests, publicly established ethical standards must be put in place. The notion that capitalism thrives only when its buyers and sellers are free to express their rational choices neglects the fact that rational choices are not necessarily ethical. The reflection of social values in establishing ethical standards is done, in capitalism, within the public domain and is the social bases of the private domain.

An expression of social value in ethical and legal practices in capitalism is that the capitalist – as opposed to the state, the laborers, or the owners of raw materials associated with production – owns the fruits of production. This primary form of ownership is a requirement for the generation of profits in capitalism.

### Profits, Competition, and Growth

The dominant class within capitalism is the capitalists – the owners of capital, meaning the owners of the means of production (not the holding of money, but the ownership of the machinery, equipment, technology, buildings, etc., required to produce commodities), and the owners of the fruits of production. Production is undertaken by the capitalist to generate surplus value over and above the total costs of production. The capitalists' surplus – profit – is then used, in part, to generate more capital and, yet again, more profits.

With the ongoing generation of profits being at the heart of capitalism, economic growth is central to its success. In fact, growth is a requirement for the sustainability of capitalism, whether it is an individual producer or an economy as a whole. No

capitalist economy can thrive without growth. Without profits, market economies cannot grow; without growth, capitalism cannot survive.

In an idealistic form of capitalism, the pressures of competition – where capitalists are driven to find ways of generating more profit in the face of other capitalists who are also motivated to do the same – ensure that those who make profits grow and survive and those who do not make profits must leave the market.

The generation of profits comes from two primary sources: (1) seeking out technological and organizational innovations that reduce costs (enabling a producer to generate greater profits than its competition) and (2) creating new “things” for consumers to buy that other producers, at least in the short run, cannot offer. The first is about achieving economies in production; the second is about increasing commodification (i.e., offering more, innovative “things” in the market).

It is also important to point out the proven relationship between profits and wages. Capitalist economies over the last two decades of the twentieth century and the early decades of the twenty-first century reveal an inverse relationship between profits and wages – profits rise when wages fall and profits fall when wages rise. This inverse relationship is a historical characteristic of capitalism.

### Unequal Powers

An idealistic view of capitalism – common in mainstream neoclassical tradition in economics and right-wing, particularly libertarian and neoliberal, politics – suggests that the two sides of a market (sellers and buyers) have equal power that, through the forces of competition and the manifestation of their individual interests, lead to the generation of profits and result in socially optimal outcomes. The reality of capitalism is quite different. Profits are more easily generated where inequality – not equality – between the two sides of the market exists.

Profits are more likely to be earned when a capitalist is in a position of power over the relationships in production (suppliers, the wages of employees, etc.), other producers (producing

something that other producers do not or cannot – whether by complete domination by monopoly or by simple product differentiation), and consumers (again through product differentiation – e.g., through marketing). Even mainstream business analysis (e.g., Porter 1985) recognizes the importance of power in the success of corporations. It is obvious to capitalists and business strategists that taking positions of power is to their advantage because it generates profits and can lead to growth. That is, creating inequalities, rather than honoring the idealistic view of competitive capitalism, is a positive characteristic of capitalism – from the perspective of capitalists. This does not mean that capitalism characterized by unequal powers generates socially optimal outcomes. How power can be used within capitalist societies depends on the degree to which the public domain accepts inequalities within the private domain – i.e., the manifestation of ethical norms determined in the public domain.

### Volatility

While contemporary, mainstream theory of markets emphasizes that individual markets tend toward a stable equilibrium (all things remaining the same – *ceteris paribus*), historical evidence shows that capitalist economies are anything but stable. Volatility is the norm. This volatility can be characterized as unstable, often unpredictable, fluctuations in prices and the output of producers. The popular, capitalist adage “buy low, sell high” implies volatility. Volatility also promotes undue speculation by simply “buying low, selling high” while producing nothing – besides market volatility. In more general terms, the capitalist characteristic of “unequal powers,” discussed immediately above, leads to market volatility.

There are no inherent mechanisms within the private domain of capitalism that dampens its volatility. Capitalism’s inherent volatility can have very serious, negative social consequences. The public domain has, since the exposition of volatility and the control of it by John Maynard Keynes in his influential book *The General Theory of Employment, Interest and Money* (Keynes 1936), acted to dampen the inherent volatility of the private domain. This is yet another example of

how the public domain and private domain act together to sustain capitalism. Again, the public domain expresses the social value of a degree of stability – in effect, and ethical standards – thus establishing limits to the inherent volatility of the private domain.

### The Evolution of Capitalism

Ultimately, an economy that finds itself under stress adapts by creating new social institutions in both the public and private domains. Since the social circumstances of different market economies face different pressures in different times, cumulative social processes differ across economies and lead to demonstrably different economic characteristics than its economic predecessors or previously related economies. From this perspective, versions of capitalism in different times and in different places exist in terms of the relative roles of the public and private domains and in other social institutions that prevail. Therefore (at the risk of using a biological metaphor that could incorrectly imply that capitalism is a natural of biological system), there can be different social species of capitalism, coming from common ancestral roots (arguably, as described by Adam Smith 1776) that have adapted to the different pressures they have been subjected to.

Many of the common characteristics of capitalism across time and place are the same, while others have changed – in effect, socially “mutated.” How the characteristics of different versions of capitalism change distinguishes a new social species of capitalism from its capitalist “relatives.” While each social species has a common ancestor, they are, as capitalism continues to evolve, demonstratively different.

### Globalization of Corporate Capitalism

With the competitive pressures of capitalism inspiring capitalists to increase commodification, and with their recognition of the advantages of unequal power (i.e., their power over others), many corporations expanded their scope from their domestic origins to global behemoths. This has been done to satisfy the requirements of generating profits and growth, central to the survival

of capitalists, and capitalism. An example of this is that, in 2016, the five largest corporations, together, generated revenues greater than Canada’s gross domestic product (the value of *all* goods and services produced by *all* producers in Canada in 2016).

A distinguishing characteristic of capitalism in the latter twentieth century and early twenty-first century is the concentration of great power in the hands of fewer capitalists – in domestic economies and globally. This has, in part, changed the interaction of capitalism’s two domains: the public domain and the private domain. In most capitalist economies, the private domain – particularly after 1980 – has becoming relatively more powerful when compared to the public domain. The social values, and ethical standards, have consequently swayed toward favoring the values of the private domain.

### Prospects for the Future

To offer perspectives on the future of capitalism, it is best to turn to those who have contributed most to our understanding of capitalism. Since the academic discipline that studies capitalism is economics, appealing to its prominent thinkers – the “worldly philosopher” – reveals very diverse points of view.

Karl Marx (1867), who recognized the pressures within capitalism – seeking greater profits and growth from the greater concentration of economic power in the hands of fewer capitalists, global expansion, etc. – suggested that capitalism would undermine itself (eventually being unable to adapt to its inherent pressures) which would lead to a new *social system of production and distribution* that would not be dominated by markets. In effect, he was optimistic that capitalism would lead to a better social system. Adam Smith (1776), on the other hand, was a pessimist. He saw capitalism rising to its pinnacle and then deteriorating (Milberg 2004). He offered no suggestion as to what would follow capitalism, only that it would end.

Joseph Schumpeter (1883–1950 – a Harvard University economist and advocate of capitalism) in his book *Capitalism, Socialism and Democracy* (Schumpeter 1942) asked “Will capitalism survive?” His reply was, “No, I do not think it can” (61). Schumpeter thought that the pressures of capitalism, particularly the need to innovate in increasingly complex markets, would lead to a kind of technocratic socialism, where experts would guide the economy for the benefit of a post-capitalist society.

Many other economists including David Ricardo (1951), John Stuart Mill (1848), Thorstein Veblen (1899, 1904), John Maynard Keynes (1963), Friedrich von Hayek (1944), and Joan Robinson (1962) have offered insights into the future of capitalism that are worth considering as it continues to evolve. It is notable that, despite serious crises in capitalist economies in the latter decades of the twentieth century and early twenty-first century, the mainstream of the discipline of economics has had little to say about the future of capitalism. Neoclassical economics takes an abstract, short-term, theoretical approach to its insights into capitalism rather than one that considers its historical processes.

## Capping Damages: Ethical Concerns

Arlen W. Langvardt  
Kelley School of Business, Indiana University,  
Bloomington, IN, USA

## Synonyms

Limitations on noneconomic damages; Limiting compensatory damages; Limiting tort damages

## Introduction

Over roughly the past three decades, proponents of the so-called tort reform movement have sought to convince policymakers that plaintiffs win negligence, medical malpractice, and other

tort cases too often and that winning plaintiffs frequently receive excessively large awards of money damages. Reform proponents have also argued that plaintiffs often bring frivolous tort claims and that defendants and their insurers end up settling such claims in order to eliminate the risk of being hit with a huge award of damages if the case proceeded to trial (Hill et al. 2007). Would-be reformers, therefore, seek changes in legal rules in order to alter this supposed state of affairs.

Those who regard tort reform as unwarranted typically point out that plaintiffs have far lower success rates than reform proponents assert and that when very large awards of damages occur, clear liability on the defendant's part and great harm to the plaintiff nearly always serve as the reasons why. Opponents of significant changes in tort law note the rarity of truly frivolous cases – ones in which the plaintiff sues even though no reasonable person would believe that he or she could win under the facts and the law. They also contend that defendants and their insurers do not typically settle frivolous claims. Instead, the cases these parties settle (or seek to settle) are the non-frivolous ones in which liability or lack thereof seems a reasonably close question (Hill et al. 2007). In such cases, a settlement at an agreed dollar amount – if such an amount were identified – would head off the risk of being held liable for a larger amount at trial.

Because of the competing arguments outlined above, the tort reform movement has proceeded in fits and starts. Some states have enacted statutes ostensibly designed to achieve the reformers' goals, whereas other states have declined to change the rules of the game. As will be seen, Congress has periodically shown interest in the possibility of federalizing certain rules.

One reform measure enacted in some states targets a certain type of damages that may be awarded to a successful plaintiff in a negligence, malpractice, or other tort case. Understanding the operation of this reform measure requires some knowledge of the types of damages available to successful plaintiffs.

## Types of Damages in Tort Cases and the Role of Damages Caps

In tort cases, plaintiffs who establish the defendant's liability are always entitled to recover compensatory damages. As their name suggests, these damages serve to compensate the plaintiff for the harm he or she experienced. (Compensatory damages differ from punitive damages, which are not routinely ordered. Punitive damages are reserved for cases in which the defendant acted not just wrongfully but in a flagrantly wrongful manner and, therefore, should experience economic punishment on top of the compensatory damages to be paid.) The successful plaintiff is eligible to receive two types of compensatory damages: *economic* damages, awarded for the amounts of medical bills, lost wages, and other readily quantifiable costs or losses incurred as a result of the defendant's tortious conduct, and *noneconomic* damages, awarded for intangible harms that resulted from the defendant's wrongful act but are less readily quantifiable in dollar amounts. Pain and suffering, related emotional distress, and the physical effects of a permanent disability serve as the classic examples of the latter type of harms.

Placing a dollar value on these intangible harms is more difficult than, say, adding up the amounts of medical bills. Nevertheless, the jury must put a dollar value on such harms in awarding damages to successful plaintiffs. Because there is no doubt that this process sometimes – though clearly not always – leads to large awards for noneconomic harms such as pain and suffering, noneconomic damages have served as a common target of tort reformers. They have tended to see such damages as the main contributors to the supposedly excessive awards of damages to winning plaintiffs. They also have pointed to noneconomic damages as a big reason why, in their view, plaintiffs bring frivolous cases in the hope of receiving a settlement payment. Capping the amount of noneconomic damages recoverable, the argument goes, would serve to keep damages awards in check and would help achieve related social benefits such as lowering liability insurance premiums and healthcare costs. Moreover, tort

reform advocates contend, capping noneconomic damages would help to deal with the supposed frivolous case problem by removing part of the incentive to bring questionable cases in the hope of effectively extorting a settlement payment.

Some states have given credence to such arguments and have enacted statutory limits on the amount of noneconomic damages that can be awarded to a successful plaintiff in a negligence, malpractice, or other tort case. Such statutes have come to be known as *damages caps*. States that have enacted damages caps have tended to choose \$250,000 or some similar amount as the maximum amount of noneconomic damages that can be awarded to a successful plaintiff in a tort case (Hill et al. 2007).

With some states having enacted damages caps but other states not having done so, there is no national rule limiting the amounts of recoverable noneconomic damages. Depending upon the political winds prevailing at the time, some members of Congress have expressed interest over the years in setting such a national rule, despite the traditional notion that tort law falls within the states' respective bailiwicks. Congress had never taken meaningful formal steps in that direction until recently, however. In 2017, the House of Representatives passed a bill that, if enacted into law, would impose a \$250,000 cap on noneconomic damages recoverable by successful plaintiffs in medical malpractice cases (Kindy 2017). The Senate had not taken action on the House bill or on a bill resembling it as of the latter part of 2017.

If such a bill were to pass the Senate as well and become law, there would be, of course, a national rule limiting noneconomic damages at least in medical malpractice cases. It would then not be the least bit surprising for Congress to follow up with a further enactment extending the cap on noneconomic damages to a broader range of tort cases.

Where caps on noneconomic damages have been implemented, there obviously have been cases in which individual plaintiffs might, or almost certainly would have, merited a larger noneconomic damages award if not for the cap. But there appears to be little evidence of a decline

in total damages awarded in tort cases in the aggregate. Neither are there clear indications that other predicted benefits of damages caps – lowering of liability insurance premiums and healthcare costs – have materialized (Hill et al. 2007).

Ethical considerations and concerns must play a role in any analysis of damages caps and their effects. As the following section will reveal, damages caps fall short of the ethical mark when they are viewed through the respective lenses of major ethical theories.

## Applying Major Ethical Theories

Consider the rights theory lens. If we accept the notion that those who suffer harm because of the fault of another have the right to be made whole – a premise traditionally present in our tort law – damages caps are problematic. They draw an arbitrary line that treats more severely harmed persons the same as those who were harmed less severely and perhaps much less severely. (See the further discussion below.) Damages caps also raise concerns under rights theory because they operate to single out the most seriously harmed persons for adverse legal treatment and to use them as a means to achieve ill-defined and ultimately unachieved ends of healthcare and insurance cost-cutting (not to mention an apparent goal of providing more of a pro-defendant slant to our tort system).

Damages caps fare no better in an ethical analysis under justice theory. They do not distribute legal treatment equally and fairly. Rather, they differentiate among harmed persons in the arbitrary way noted above. Importantly, too, damages caps prove problematic under justice theory because the differentiation they enshrine makes those who are the worst-off even worse off in a relative sense.

Consider, for example, four plaintiffs who bring tort cases in a state that caps recoverable noneconomic damages at \$250,000:

- Plaintiff #1, who brings the rare truly frivolous case in which there is no even arguably

reasonable basis whatsoever for imposing liability on the defendant

- Plaintiff #2, who can, or probably can, establish liability on the part of the defendant but sustained minor harm
- Plaintiff #3, who can, or probably can, establish liability on the part of the defendant and sustained moderate harm of a temporary nature
- Plaintiff #4, who can establish liability on the part of the defendant and suffered not only extreme, long-lasting pain but also a severe disability that will profoundly limit her activities for the remainder of her life

Of course, Plaintiff #4 is clearly the worst-off of the four before the damages cap is applied.

When we begin to consider the effects of the damages cap, we see that Plaintiff #1 is not affected at all because he could not win on the merits if the case went that far and because, as previously noted, defendants and their insurers typically do not settle truly frivolous cases. If they decided to depart from that practice and pay Plaintiff #1 something as a nuisance value payment in order to dispose of the case, it would be a token amount nowhere close to \$250,000. Plaintiff #2 also will not experience adverse treatment as a result of the damages cap. She may be able to win her case on the merits or receive an agreed-upon settlement payment from the defendant, but the minor nature of her harm would mean a payout of considerably less than \$250,000 for noneconomic harm. Hence, the damages cap would not come into play.

Plaintiff #3 has a good chance of winning her case if it goes to trial and therefore could be a candidate for an agreed-upon settlement instead. If his moderate harm of a temporary nature was not bad enough to trigger a jury verdict or settlement amount of more than \$250,000 for noneconomic harm, he too would not be affected by the damages cap. If his harm was significant enough that a jury might otherwise have awarded him somewhat more than \$250,000 in noneconomic damages – or the defendant might otherwise have offered him somewhat more than \$250,000 by way of settlement – then the damages cap's

\$250,000 limit would have some adverse effect on him.

However, the possible adverse effect on Plaintiff #3 would pale by comparison with the adverse effect on Plaintiff #4. Her extreme and long-lasting pain and her permanent disability, caused by a defendant who clearly was at fault, would almost certainly have resulted in a jury verdict for far more than \$250,000 in noneconomic damages or an agreed-upon settlement amount well in excess of the cap amount. The cap, however, would limit her to \$250,000 for noneconomic harm. Clearly, then, the plaintiff who was already easily the worst-off would be made even worse off, in a relative sense, by the damages cap. In the end, such caps take the ethically questionable approach of singling out those with the strongest legal claims and disadvantaging them the most.

Even the ethical theory that might initially have seemed to support damages caps when some states enacted them furnishes little support for them now that experience has provided greater ability to assess their effects. One inclined to conjure up a utilitarian, greatest-good-for-the-greatest-number argument might have asserted that even though some plaintiffs would be disadvantaged by damages caps, relevant individuals, organizations, and entities (e.g., liability insurers, hospitals, and the like) would benefit in their bottom lines. Moreover, the argument would have gone, there was greater good to be achieved for society in the form of reduced litigation costs, lowered liability insurance premiums, and better-controlled healthcare costs.

Experience with damages caps now tells us, however, that the predicted social benefits – key parts of the supposed greatest good in that initial balancing – have not materialized. What remains, then, are the benefit to certain entities on the one side and the harm to severely harmed persons, as well as to the traditional legal framework for making harmed persons whole, on the other. The greatest-good-for-the-greatest-number calculation now looks very different.

As other states and Congress consider the imposition of caps on noneconomic damages,

one hopes that they give due consideration to the ethically problematic nature of such caps.

## Catholic Social Thought

Domènec Melé  
IESE Business School, University of Navarra,  
Barcelona, Spain

## Synonyms

Catholic Social Doctrine; Catholic Social Thought; Catholicism on social morality; Social teachings of the Roman Catholic Church

## Definition

Catholic Social Thought (CSTh) refers to the reflection developed by Catholic thinkers, theologians, and other scholars on social life and specific social issues, as well as the ideas, proposals, and the experience of Catholic people involved in social issues.

Central to this thought is Catholic Social Teaching (CST) or Social Doctrine of the Church, formulated by the *Magisterium* of the Catholic Church and expressed in councils, papal encyclical-letters, bishops' pastoral letters, and other documents. John Paul II has defined CST as “the accurate formulation of the results of a careful reflection on the complex realities of human existence, in society and in the international order, in the light of faith and of the Church's tradition” (John Paul II 1981, no. 41).

CST includes values and virtues for social life, along with ethical principles, criteria for judgment, and guidelines for action as a base to build, as the *Compendium of Social Doctrine of the Church* (CSDC) (no. 19) affirms, an “*integral and solidary humanism* capable of creating a new social, economic and political order, founded on the dignity and freedom of every human person, to be brought about in peace, justice and solidarity.”

## Historical Development

Catholic social thought has existed among the community of believers since the beginning of Christianity. It includes the teachings of Jesus, with his commandment of love and by identifying Himself with people in need. It also assumes elements of Jewish law and the teaching of the prophets of the Old Testament. This moral-social thought was present in the Church Fathers in the first centuries of Christianity. Outstanding Catholic thinkers such as Thomas Aquinas and Augustine of Hippo have also enriched CSTh for ages. Since the mid-nineteenth century, a modern perspective of CSTh has arisen in response to the problems created by the Industrial Revolution regarding workers and working conditions, and this continues to receive significant attention by both academics and practitioners.

The origin of modern CST is generally accepted as being Leo XIII 1891, when Pope Leo XIII published the celebrated encyclical-letter *Rerum Novarum* (on the new things), in which he spoke in favor of justice in contracts and wages, humane working conditions, and freedom to create and manage workers associations, among

other issues. These seminal teachings have been developed and augmented by Leo's successors in the Papacy – including, among others, Pius XI (1931), John XXIII (1961, 1963), Paul VI (1967, 1971), John Paul II (1981, 1987, 1991), Benedict XVI (2009) and Francis (2015). The Second Vatican Council document *Gaudium et Spes* (Joy and Hope) (1965) is especially outstanding. The *Compendium of Social Doctrine of the Church* (2004), published by the Pontifical Commission Justice and Peace, summarizes the previous CST and is also noteworthy.

## Main Topics

Currently, both CSTh and CST include a vast set of ethical topics. Some of these regard business and socioeconomic life – covering, among others, human work and labor rights, free market economy, production, human relations within the organization, commerce, consumerism, wealth distribution, globalization, natural and human ecology, and sustainability. Others relate to social life and political community, including the defense and promotion of human rights, fighting against oppression, concern for social justice, the role of the state, social cooperation, organizing social and organizational life, the development of people, international relations, cooperation among people, and the promotion of justice and peace in the world. CST is also concerned with the defense of human life from conception to natural death, the family, and education. Ideologies have also have received attention in both CSTh and CST. Some of them, including communism, atheism, fascism, and Nazism, have been condemned. Other ideologies, such as liberalism, feminism, socialism, and capitalism, have been criticized in some form.

## Some Characteristics of CST

Some significant characteristics of CST can be outlined (partially taken from CSDC, nos. 72–86):

- (a) *CST has faith and reason as its cognitive sources.* CST finds its essential foundation in biblical revelation and in the tradition of the Catholic Church, in which reason has its role. Faith is central, but does not substitute reason in the understanding of human nature and social reality. Science, particularly social science, is often used as a matter of reflection.
- (b) *CST is religious and moral in character.* It is neither an ideology nor a pragmatic system of ideas intended to define and generate economic, political and social relationships. Likewise, it does not deal with technical matters nor propose, nor establish models, programs nor specific systems of social organization.
- (c) *CST is a consistent body of doctrine with its own internal logics and is oriented toward action.* It is far from being a systematic organic treatise of social ethical issues, but, due to its internal logics is reasonable and therefore, a dialogue between CST and other ethical approaches to socioeconomic issues is possible.
- (d) *CST is offered to Catholic faithful and also to all people of good will.* In practice, CST is appreciated not only by Catholic communities, but also by other Christian churches and communities, by followers of other religious traditions, and by people who belong to no religious group.
- (e) *CST is interdisciplinary.* It is open to all branches of knowledge, recognizing and receiving everything that contributes to a better understanding of reality. At the same time, CST challenges science to dialogue, offering meaning, ethical perspectives and commitment to humanize science.
- (f) *CST involves both continuity and renewal.* Though standing firm in its principles, CST is not a rigid teaching system. In its development, CST shows concern for the evolution of the society and “the signs of time” (changes which require discernment).
- (g) *CST entails “denunciation” but above all “proclamation.”* John Paul II (1981 no. 41) made clear that proclamation of the

fundamental conditions for justice and love in the economic and social situations is always more important than denunciation of injustices, and the latter cannot ignore the former, which gives it true solidity and the force of higher motivation.

- (h) *The interpretation of CST requires an attentive discernment.* CST entails principles of permanent value and social analysis and teachings regarding specific historical situations. It is key to distinguish in each teaching “the level of independence from contingent and variable elements, and by the frequency with which they are invoked” (SCDC, no. 80).
- (i) *CST emphasizes love for the poor.* Following the Love of Jesus for the poor, the Church speaks of a *preferential option for the poor*; but this love is never exclusive or discriminatory against other groups. At the same time, CST clarifies that this option is not limited to material poverty, since it is well known that there are many other forms of poverty, such as the cultural and spiritual (John Paul II 1991, no. 57).
- (j) *CST has evaluative, inspirational, and educational functions.* CST allows one to evaluate situations and social problems, but can also inspire specific proposals for humanizing social contexts. Its educational function is ordered to favor awareness in the Christian faithful of their social responsibility, and to promote responses to this in accordance with the capacities and circumstance of each believer.

### Values, Virtues, and Guiding Principles Intertwined

Drawing from the Christian supreme commandment of love, Benedict XVI (Benedict 2009, no. 2) affirms that “love is at the heart of the Church’s social doctrine,” and clarifies that “to love someone is to desire that person’s good and to take effective steps to secure it” (Benedict 2009, no. 7). Benedict adds that love is

inseparable from truth and states: “love in truth (*charitas in veritatis*) is the principle around which the Church’s social doctrine turns” (Benedict XVI Benedict 2009, no. 6).

Love in truth, which differs from attitudes of mere sentimentalism, leads to a full recognition of the dignity of each individual. In this sense, and complementarily, John Paul II (1991, no. 11) affirms that the guiding principle of the Church’s social doctrine “is a correct view of the human person and of his unique value.” This view comes from the reality that the human being, according to the Bible (Genesis 1:26–27) has been created to image of God (*imago Dei*), with reason, freedom, and sociability. It entails seeing the society ordered to the person and the person acting with responsibility to promote a good society.

Love is not opposed to justice. On the contrary, love entails justice as its first requirement. Justice consist in giving to each what is due, which demands respecting all types of rights, keeping legitimate contracts, and honoring one’s word. In the business context, justice leads us to honest and fair behavior in any activity. Love, however, goes further than justice by offering what is “mine” to the other.

Another crucial value of CST is freedom, but not a freedom without right deliberation. On considering the matter, CST stresses that a link between freedom and truth exists, which has implications for responsible behavior. In exercising their freedom, people perform morally good acts that are constructive for the person and for society when they are obedient to moral truth.

Love, truth, justice, and freedom – exercised responsibly – are crucial ethical values for social life. They are intertwined with guiding principles and virtues (CSDC, nos. 197–208). Virtues are strengths of the character which favor good behavior, and this is crucial for social life. CST indirectly emphasizes virtues by affirming that social structures are important but “authentic social changes are effective and lasting only to the extent that they are based on resolute changes in personal conduct” (CSDC, no. 134).

Neighborly love entails the recognition that every human individual is endowed with

transcended dignity, innate human rights – associated with this dignity – and called to grow as a human being.

## Permanent Principles

Around these foundations, CST enumerates a number of crucial permanent principles concerning the reality of society in its entirety. These principles are presented as interrelated, offering complementary requirements, and as a unity. The main principles (CSDC, nos. 105–114, 160–196), with some references to economic and business, are the following:

- (a) *Personalistic principle*. This regards the inviolable dignity of the human person and requires dealing with each person as an end – avoiding, in any circumstance, that the human person is manipulated for ends that are foreign to his or her own development.

The dignity of the person constitutes the foundation of the equality of all people. In consequence, all forms of discrimination against this basic equality are unacceptable. A just society should respect the transcendent dignity of the human person. Around the personalistic principle, CST establishes that “man is the source, the center, and the purpose of all economic and social life” (*Gaudium et Spes*, no. 63).

- (b) *The common good principle*. The society, at every level, should seek the common good as its primary goal – the good of all people and of the whole person. The common good consists of three essential elements: respect for and promotion of the fundamental rights of the person; prosperity, or the development of the spiritual and temporal goods of society; the peace and security of the group and of its members. Pursuing the common good is

what gives moral legitimacy to any social institution, including markets and businesses.

The ultimate purpose of economic activity is to serve the person and the society, and so too is that of the business firm. The latter is seen as a society of persons who are joined together, not as a mere “society of capital goods.” “The purpose of a business firm is not simply to make a profit, but is to be found in its very existence as a community of persons who in various ways are endeavoring to satisfy their basic needs, and who form a particular group at the service of the whole of society” (John Paul II 1991, no. 35).

The economic system should also work towards the common good. In this context, a centrally-planned economy is not acceptable due to its lack of respect for human dignity and rights. In contrast, CST recognizes “the fundamental and positive role of business, the market, private property and the resulting responsibility for the means of production, as well as free human creativity in the economic sector.” However, the judgment is negative for a Capitalism “understood as a system in which freedom in the economic sector is not circumscribed within a strong juridical framework which places it at the service of human freedom in its totality” (John Paul II 1991, no. 42).

Related with the common good principle are concern for future generations (*sustainability*) and preforming business and other activities with a sense of stewardship and taking “care of our common home” (Francis 2015). This concern, acting with a sense of communion with people and other beings – which are seen as God’s creatures – embraces the whole of nature.

- (c) *Principle of solidarity*. This states that every person and group is obliged to contribute to the common good of society at all its levels. It is opposed to all forms of radical individualism and abuse of power. This principle entails the intrinsic social nature of the human

person, the equality of all in dignity and rights, and the common path of individuals and peoples toward an ever more committed unity.

In the business context, the principle of solidarity requires fostering cooperation within the organization and with stakeholders. Competition should be carried out within a framework of cooperation. Producing or sending products contrary to human dignity, predatory pricing, poor working conditions, and exploitation of workers are examples of a lack of solidarity.

Business people are called to work with solidarity for the common good. “Business is a noble vocation, directed to producing wealth and improving our world. It can be a fruitful source of prosperity for the areas in which it operates, especially if it sees the creation of jobs as an essential part of its service to the common good” (Francis 2015, no. 129).

(d) *Principle of subsidiarity.* A community of a higher order should not interfere with the life of a community of a lower order, taking over its functions. In accordance with this principle, every social activity ought of its very nature to furnish help to the members of the body social, and never destroy or absorb them. In case of need, the community of a higher order should, rather, support the smaller community and help to coordinate its activity with activities in the rest of society for the sake of the common good. This principle protects freedom and fosters the contribution of people through their talents, initiative and responsibility. It is opposed to all forms of collectivism and favors private initiative in business. Within the organization, this principle requires respect for people in their creativity, initiative and autonomy, done with a view to facilitating their contribution to the common good.

(e) *Principle of the universal destination of goods*, which can be encapsulated by saying

that every person must have access to the level of well-being necessary for his or her full development. This principle recognizes the necessity that the earth and its resources – God’s gift to all humankind – is shared and enjoyed by all. This is compatible with private property, necessary to support freedom and to affront future need, but such property has endowed a social function to make this universal destination of goods possible. Most people access it through remuneration for work; others need assistance, even social and governmental actions toward a redistribution of wealth.

(f) *Principle participation.* This refers to personal and social contribution to social and civic life. Within business enterprises, CST proposes harmonizing the necessary unity of management with an active sharing of all in the administration and profits; not with rigidity, but through ways to be properly determined in accordance with each situation.

## CEO Compensation and Just Pay Theories

Alexander Andersson and Joakim Sandberg  
University of Gothenburg, Gothenburg, Sweden

### Synonyms

Executive compensation; Executive remuneration; Fair pay; Just wage

### Introduction

Microsoft's CEO Satya Nadella received \$44,321,738 in total compensation in 2020. His compensation was 257 times the median employee's pay at Microsoft that year. Nadella's total compensation was significantly higher than the average compensation for all S&P 500 CEOs, which was \$15.5 million in 2020 (AFL-CIO 2022). Even if Nadella can be considered an outlier in this regard, one cannot deny that many CEOs and other executives are paid very generously compared to other workers. This prompts the question: how, if at all, can one defend these pay differences on moral grounds? This entry gives an overview of **just pay theories** and how they are used to defend and criticize executive pay practices.

A just pay theory is a theory which identifies the moral values or principles that ought to guide how individuals are remunerated for their work. Since most decisions about pay packages are

made in a business or professional context, it is not difficult to see how the issue of just pay should be a central concern in business and professional ethics. However, the issue is also connected to more fundamental questions about distributive justice in society as a whole. The focus of this entry is executive pay practices, and in particular CEO compensation practices, since they have become the target for intense moral scrutiny and debate over the last decades.

### Incentive-Based Views

One common defense of executive pay practices appeals to **incentive-based views**. These views hold that workers should be paid in whatever way that provides the best incentive for the relevant kind of work. Incentives can be important for attracting and retaining the most talented individuals for the job, as well as for motivating these individuals to reach their full potential. One view is that this should be achieved at the lowest cost possible. This view does not necessarily commit a firm to hiring the smartest and brightest if they can generate as much profit with less talented (and less costly) individuals. It seems fair to say that incentive-based views address the issue of just pay from the perspective of the company, rather than from the perspective of the worker. They can therefore be viewed as tantamount to a doctrine of efficiency (Heath 2018). However, not all incentive-based views focus on maximizing firm value. An incentive-based view is also present in John Rawls's scholarship, where the idea is that income inequalities should be allowed as a way of incentivizing growth of the social product to the advantage of those who are worst-off (in accordance with the difference principle). Lastly, all forms of incentive-based pay are forward-looking. Incentives are a means for getting people to do certain things. A high CEO salary might attract top talent to the position, while long-term executive stock options could be a way of retaining the CEO, and qualified bonuses could be a way of motivating the CEO to put in the extra effort (cf. Kolb 2012).

The defense of current CEO pay practices, from this view, basically amounts to the hypothesis that Microsoft would not be able to attract, retain, and motivate Nadella if they did not offer such a generous compensation. That is, they would not find anyone who is as qualified and well-suited for this stressful, highly demanding, and onerous position if they offered a lower pay (Kolb 2012). While this seems simple enough, it is not a watertight argument. For starters, there are several jobs that require a high level of skill, adaptability, stress tolerance, and a cool head to make sensible decisions under pressure, that are not nearly as generously compensated as the CEO position. For instance, most would expect heads of states and military generals to perform at their best without the offer of annual bonuses when they achieve certain goals. Another thing to consider is that the evidence for a correlation between CEO pay and firm performance is inconclusive (cf. Smirnova and Zavaertiaeva 2017). In other words, it is not necessarily the case that firms get more out of their CEOs the more they pay them. Lastly, incentives in the form of bonuses, stocks, or options may have unintended consequences depending on the conditions that apply to these payouts. In the case of the global financial crisis of 2008, large and risky bets on the unstable housing market seem to have been encouraged by the promise that those who made the "right call" could cash out a hefty bonus. When these bets turned out bad, most of the costs did not befall those who made the wrong call, but instead the ordinary people who lost their jobs, pensions, and savings. The example illustrates how difficult it is to calculate the future costs and benefits of various incentive programs, especially if one goes beyond the firm's perspective and also considers society as a whole (Sandberg and Andersson 2022).

### Desert-Based Views

An alternative perspective on just pay involves **desert-based views**. Such views hold that workers should be paid in accordance with their level of desert (or merit). While incentive-based views are forward-looking in the sense that they

concern incentives for future contribution or effort, desert-based views are essentially backward-looking. One can view desert as an input-output function: for whatever action a person performs, she deserves to get something in return. The deserved outcome should also stand in direct proportion, in value or effect, to the relevant action or activity. Put more formally, desert can be analyzed as a three-place relation between a deserving subject (X), a treatment or good (Y), and the grounds which make them deserving of said treatment or good (Z). That is, X deserves Y on the basis of Z. When it comes to desert of economic benefits, such as income and wealth, it is clear that X refers to workers and Y stands for one's level of pay. Z is usually understood in terms of either effort or contribution, depending on whether one views pay as a form of compensation (for effort) or reward (for contribution) (Andersson and Sandberg 2019).

Desert-based views have been used to both defend and criticize executive pay practices. A defense could be that Nadella deserves his \$44 million per year as a compensation for the effort that he puts in at Microsoft. The idea being simply that the job is so onerous and, given that Nadella is the highest paid employee at the company, no one exerts an effort comparable to that of Nadella. This notion of desert has some intuitive appeal. Most people think that “tougher” jobs, such as garbage collecting and underwater oil rig welding, deserve to be compensated higher than jobs that have more pleasant working conditions. Still, it is difficult to determine exactly what should go into the concept of “effort.” Is it the amount of time spent at work? It is highly unlikely that Nadella spends 257 times more time at Microsoft than his lesser paid employees. Is it the amount of physical or psychological effort exerted? It is not probable that Nadella's line of work involves a physical or psychological challenge that is 257 times greater than that of others at the company, even if he is constantly thinking about Microsoft's future. Could it be that the CEO position is 257 times more onerous and taxing than other lines of work at the company? While it definitely can be an ungrateful position in times of financial distress, it seems unlikely that this would be the case in

general. An overarching problem for the appeal to desert in the form of compensation for work-related costs is that it always seems to involve some kind of limit. There are only so many hours that one can spend at work, and a job can only be so onerous (Brouwer and van der Deijl 2021).

An alternative defense could be to instead think of Nadella's pay as a reward for his contribution to the company or to society. This too has some intuitive pull. Most people would say that George R.R. Martin is deserving of the profits he enjoys from his *Game of Thrones* series or that Elon Musk deserves a high pay for his creative innovations that benefit the progress of society. Unlike the concept of effort, contribution does not appear to have a built-in limit, since the value one creates for a company or society can be exceptional and of a limitless magnitude. Nadella can then be said to deserve his high pay due to his prominent leadership at a company which is at the forefront of the technological frontier. Still, there are other problems with this appeal to desert as contribution. First, it is reasonable to assume that the success of Microsoft is a team effort and that it builds on the foundation of Nadella's predecessors. This does not mean that Nadella's contribution is meaningless, but it makes it more difficult to determine just where other people's contributions end and his contribution begins. In very complex joint ventures, where the contributions of different workers intimately depend on each other, it may prove practically impossible to disentangle these workers' contributions and therefore deserts (Mulligan 2018). It is then practically impossible to determine whether Nadella contributes 257 times more to Microsoft's profits than his lesser paid employees do.

A broader issue here concerns how one should understand the notion of contributing to society. If it is simply a matter of satisfying preferences by providing goods and services that people want, then Nadella seem to be adequately paid if we look at the size of Microsoft's customer base (and assuming that Nadella can rightfully take credit for this success). However, defining contribution to society in terms of preference satisfaction is rather narrow. This undermines, if not

excludes, the contributions of workers in the public sectors, whose primary purpose of work is to satisfy people's *needs* rather than *wants*. The work of nurses, teachers, firefighters, and police officers is in many ways essential to a well-functioning society. In other words, without their *contribution to society*, we would be a lot worse off. But just as it seems unfair to compare the work of Nadella to that of nurses based on some idea of preference satisfaction, it seems equally unfair to compare the value of Nadella's work to that of nurses based on whether they satisfy people's needs. So the very idea of contributing to society seems too broad to permit simple calculations of deserved pay.

### Procedural Views

A final group of views are **procedural views**. These hold that workers should be paid whatever pay that is determined by, or agreed upon in, a fair pay-setting process. The focus here is the fairness of the process rather than the details of the result. Thus, unlike on incentive-based views, the aim is not to have a cost-effective level of pay. Neither is it important that the pay stands in proportion to a worker's effort or contribution, as is the case on desert-based views. Instead the central aim is to make sure that pay negotiations are set up in a *fair manner*. With regards to Nadella, we should not be concerned about the precise level of his total compensation per se, nor with how it compares to the pay levels of other workers at Microsoft. If the compensation levels were set under fair conditions, then there are no moral grounds for complaining about the result. This line of thinking should be well-known to those familiar with Robert Nozick's conception of procedural justice.

As with all transaction, there is a buyer and a seller in the CEO pay-setting process. The company, which in this case boils down to the owners and the shareholders, is the buyer of the CEO's services. As companies can have thousands of shareholders, it is impossible for all of them to be present when the negotiation takes place. The solution is to have a board of directors that acts on behalf of the shareholders. As negotiations start,

then, it is in the interest of the board to pay the CEO as little as possible (in line with the cost-effectiveness perspective outlined above), whereas it is in the interests of the (prospective) CEO to be paid as much as possible. In order for the negotiation between the two sides to proceed in a fair manner, there are at least two important conditions. First, the two sides need to be independent from each other as to balance the interests of the CEO and that of the shareholders. For example, the board members should not be dependent on the CEO in any way. Second, both sides – and especially the board – need to be sufficiently informed. As Moriarty puts it: "If they do not know what kind of talent it takes to run the firm, and how rare that talent is, they are liable either to overpay a mediocre CEO or to underpay an exceptional one" (Moriarty 2005: 259). If both of these conditions are satisfied, one can confidently hold that Nadella's pay is justified from a procedural view.

There are, however, problems pertaining to both of these conditions, which make it doubtful whether most executives receive their pay as the result of a fair process (Bebchuk and Fried 2004). The first worry concerns the "managerial power hypothesis." Its focus is the power that the CEO can hold over the board of directors, which gives the CEO the ability to dictate the conditions of his or her compensation plan. Managerial power can come in many forms, but one of the most debated practices is when the CEO is also the chair of the board of directors ("CEO duality") – a role which Nadella took on in 2021. Another example is when the CEO has indirect influence over who sits on the board. This is problematic since an appointment to the board of directors is typically regarded as a privilege, because it tends to come with handsome remuneration as well as the opportunity to build business relationships with other board members. There can therefore be a bond of loyalty between the CEO and newly appointed board members. What is problematic here is that the board members are not sufficiently independent from the CEO to ensure a balanced negotiation when it comes to setting the CEO's pay (Kolb 2012).

A second worry is that board members can be expected to be at an informational disadvantage in

comparison to the CEO with regards to the financial situation of the company. Whereas the CEO spends almost all of his or her time in the company, the board members are typically only present at a certain amount of board meetings per year. This can create another type of power imbalance which risks undermining the fairness of the negotiations between the CEO and the board of directors. Interestingly, it seems that companies sometimes have to choose which of these two problems that is most worrisome. Because a common way of addressing the informational asymmetry is to use board members who themselves work as CEOs in comparable companies. But such people of course have reasons to prefer higher pay packages for CEOs since they are CEOs themselves, so they cannot be said to be sufficiently independent to ensure a balanced negotiation.

## Concluding Remarks

Philosophical theories about just pay are useful for the purpose of having a sound debate about the moral values and principles that ought to guide how individuals are remunerated for their work. Since most decisions about pay packages are made in a business or professional context, it is not difficult to see how the issue of just pay should be a central concern in business and professional ethics.

All three just pay theories mentioned in this entry can be used to both defend and criticize the current levels of CEO pay, including Nadella's compensation of \$44 million per year. In order to determine whether such CEO compensation practices are morally justified, then, one not only need to compare the different theories to each other but also engage in more detailed analyses of various conceptual and empirical claims related to each theory. For instance, what type of pay packages give the best incentives for different groups of workers? How do you disentangle the contributions made by the CEO from the contributions made by other groups of workers? And

how do you best set up a pay-setting process that balances the interests of the employers and the employees? These are some examples of good questions for further research in the realm of CEO compensation and just pay theories.

## CEO Leadership and Gender

Kenneth Chukwuba  
Management and Marketing, Southwest  
Minnesota State University, Marshall, MN, USA

### Synonyms

CEO; Differences; Gender; Leadership; Leadership style; Organization

### Definition

#### CEO Leadership and Gender

Scholarship on CEO leadership and gender is prolific. However, scholarship at the interface of CEO leadership and gender in organizations remains scarce. I draw from literature about CEO leadership and gender in organizations to identify three research streams ((a) gender and leadership, (b) gender differences as a function of perception and stereotype, and (c) gender differences in leadership style) as well as analyze opportunities for future research. The authors argue that more paradigmatically diverse research on organizations might be doubly important: it can allow for the development of textured theories on context as well as open possibilities for revitalizing organization theory. Before exploring the three facets of gender enumerated above, as the design or methodology approach, I reviewed the research evidence on CEO leadership and gender. This review serves as the foundation for the discussion of three perspectives regarding CEO leadership and gender. Results show leadership gaps between women and men in that women tend to use the transformational leadership style, whereas men use a transactional leadership style. Female leaders tend to focus on people and relationships, whereas men place greater emphasis on organizational goals and objectives.

## Introduction

The organizational literature now decisively recognizes the impact of CEO leadership on organizational outcomes signifying that effective leadership improves individual, team, and organizational outcomes across contexts (Avolio et al. 2009; House et al. 2004; Jackson and Parry 2008; Sarros 2009). In a 2007 study on Australian organizations, Bartram and Casimir indicated that leadership positively influenced follower performance and satisfaction, trust in the leader, empowerment, and an innovation-supporting climate (Casimir et al. 2006; Sarros et al. 2008). Researchers of the abovementioned studies used identical survey questionnaires to examine the influence of hierarchical superiors on individual, unit, and organizational outcomes of subordinates. However, fewer studies have emphasized the benefits of using qualitative methodologies to examine leadership processes and their effects on Australian employees (Parry and Meindl 2002; Sarros 1992).

Women continue to enter the workplace in increasing numbers in most developed countries (Davidson and Burke 2016). Reasons that account for these trends are increasing numbers of industrialized economies, the growth of service sectors opening positions for women, and the growth of public and nonprofit sectors creating new opportunities for women.

Statistics show that men still dominate the top executive positions, although the percentage of female CEOs has increased slowly from 0.23% to 4.05% in the past few years (see Fig. 1). A 2008 study by Campbell and Vera and a 2012 study by Dezső and Ross showed that gender diversity in top management positions results in better firm performance. However, the relationship between gender of the CEO and firm performance is quite a new field in leadership studies (Khan and Vieito 2013).

Studies that looked at the relationship between CEO gender and firm performance (e.g., Khan and Vieito 2013; Peni 2014) revealed that companies with female executives experience a growth in performance compared to those led by men. Krishnan and Parsons (2008) found that

**CEO Leadership and Gender, Fig. 1** Growth of female CEOs

organizations with high gender diversity in top management positively and significantly correlate with high remuneration quality. In addition, organizations with more women in top management positions are more profitable and have higher stock returns after IPOs than those with fewer women in the top management team (Krishnan and Parsons 2008).

## Theoretical Models

Researchers have used numerous theoretical models to study gender and CEO leadership. Each model focuses on an organizational, social, or individual distinction. Each study worked to illuminate how and why gender leadership differences might exist and why different styles might be appropriate in different preemptive and strategic situations for each organization and its culture (Burke and Collins 2001).

## Literature Review

The literature review in this entry will focus on the three research streams identified: (a) gender and leadership, (b) gender differences as a function of perception and stereotype, and (c) gender differences in leadership style (see Fig. 2).

Investigation of leadership has a long and often unsubstantiated history. For centuries, researchers have worked to establish the traits and behaviors (Bass 1990) that result in effective leadership. In

**CEO Leadership and Gender, Fig. 2** Gender and leadership

addition, the focus has been on leadership that is transformational versus transactional and leadership that is “authentic” (Avolio and Gardner 2005; Davis-Blake and Pfeffer 1989; Hooijberg et al. 2007; Jonsen et al. 2010).

A Google search yielded more than a million hits. Leadership depends on one’s ontological and epistemological attitude and assumptions (Hunt 2004; Jonsen et al. 2010). Researchers frequently define organizations publicly by its leaders at the top echelon and often investigate CEO effects (Jonsen et al. 2010; Waldman and Yammarino 1999). Leadership is vital throughout management levels (Bass 1990) and prevalent in much of the management literature.

The idea that men and women are from different planets (i.e., radically different) (Wood 2002) and that their ways of leading and managing differ

genetically (Senge 2008) is current in popular culture. However, empirical evidence does not show significant gender differences in leadership (Jonsen et al. 2010). In a 1999 study by Butterfield and Grinnell, a 2007 study by Eagly and Johannesen-Schmidt, and a 2003 study by Vecchio, the role of gender and leadership remained inconsistent. Some studies supported the notion of gender differences, for example, that women tend to be slightly more “transformational” (Alimo-Metcalfe et al. 2008; Bass and Avolio 1994; Eagly and Carli 2003), democratic, participative, and inclusive (Eagly and Johnson 1990). Research on gender-related comparisons of leadership styles according to gender traits is extensive (Carless 1998; Eagly and Kite 1987; Jonsen et al. 2010).

### Gender Differences in Leadership Style

A unique method to understanding the gender gap is to examine differences between men and women on attributes pertinent to leadership style. Though the role of traits in understanding leadership style emergence and efficacy has been debated in the literature, the extant research divulges that traits do play an important albeit limited role in leadership style effectiveness (Zaccaro et al. 2008). The lone argument trying to elucidate the leadership gap is that women are far different from men in traits related to effective leadership style.

Studies revealed some slight differences between men and women on traits associated with effective leadership style, such as men displaying slightly more assertiveness than women and women displaying fairly higher levels of integrity; however, generally, the differences favor women as much as men (Carli and Eagly 2007; Feingold 1994; Franke et al. 1997; Zaccaro et al. 2008). Kellerman, in a 2003 study, postulated that perhaps women’s values differ from men’s such that they have fewer desires to lead. This viewpoint is not supported by studies signifying that women and men in similar jobs are equally committed to their jobs and equally desire leadership roles (Catalyst 2004; Carli and Eagly 2007; McEvoy 1997).

In a 2001 study, Burke and Collins provided insights on gender and differences in leadership styles and management skills, identified based on self-reported data collected from a sample of male and female accountants. To an extent, female accountants differed from their male counterparts in that women in the accounting profession defined their career advancement by using an interactive leadership style, called transformational leadership, which correlates highly with seven management skills usually connected with achievement (Burke and Collins 2001).

The majority of the past research on leadership focused on detecting personality traits associated with effective leadership and understanding the influence of situational factors on the leadership process (Burke and Collins 2001; Chemers and Ayman 1993). In the 1990s, as organizations began undergoing major structural changes due to downsizing, new trends of leadership research materialized. Scholars started to focus their attention on the two contracting leadership styles: transformational leadership and transactional leadership. Researchers subdivided transactional leadership into two components of contingent reward and management-by-exception leadership styles (see Fig. 3).

### Contingent Reward Leadership

Leaders who use the contingent reward leadership style introduce work standards, communicate these standards to their followers, and let

**CEO Leadership and Gender, Fig. 3** Components of transactional leadership

followers know the rewards they will get if their performance is satisfactory. A leader applying this leadership style makes an unwritten or written contract with followers that informs followers about what is expected and what will occur if expectations are or are not met. Followers are guaranteed rewards contingent on good performance or punishments contingent on bad performance (Avolio et al. 1999; Avolio and Bass 1988; Bass 1985; Bass and Avolio 1993a, b).

#### Management-by-Exception Leadership

Management-by-exception leaders are more likely to take advantage of the power to reward and reprimand followers based on the formal authority that goes with their position in the organization. Leaders who use the management-by-exception leadership style carry power based on their rank in the organizational structure (Burke and Collins 2001). These leaders focus on identifying errors and implementing discipline for poor performance. In other words, the focus of the leader using the management-by-exception style is on identifying errors and disciplining followers for poor performance (Avolio et al. 1999; Bass 1985; Burke and Collins 2001).

#### Transformational Leadership

Transformational leaders produce positive relationships with followers to support employee

and organizational performance. Leaders who display transformational leadership encourage employees to look past their own needs and focus instead on the interests of the entire group. In a 2006 study by Jones, transformational leaders achieved these results in the four interrelated components of transformational leadership:

1. Transformational leaders may be charismatic and serve as role models to their followers (attributed charisma).
2. Transformational leaders may intellectually stimulate employees (intellectual stimulation).
3. Transformational leaders may persuade employees to believe in the mission and its attainability (inspirational motivation).
4. Transformational leaders may meet the emotional needs of employees (individualized consideration; Avolio et al. 1999; Avolio and Bass 1988; Bass 1985; Bass and Avolio 1993a, b; see Fig. 4).

#### Gender Differences as a Function of Perception and Stereotype

Female leaders may respond to stereotypes by suppressing normative gender conduct or acting like men to enable them to rise through the ranks of an organization (Hoffman and Hurst 1990; Ridgeway 2001, as cited in Plante et al. 2009; Stelter 2002). In a 2000 study, Oakley established

#### CEO Leadership and Gender,

**Fig. 4** Components of transformational leadership

a similar behavioral style among female leaders who modulate their femininity in favor of added masculine behaviors related to leadership accomplishment. Some scholars argued that employee or person-center leadership (Stelter 2002) is rapidly replacing job or task-oriented leadership, and the shift underscores the importance of studying employee preference for leadership style (Boatwright and Forrest 2000; Stelter 2002). In 1999 study by Gardiner and Triggerman and a 2002 study by Stelter, female leaders tended to focus on people and relationships, whereas male leaders placed greater prominence on organizational goals and objectives.

In studies of gender, differences in organizational perceptions, and stereotypes, Madden (2011) wrote that women display more transformational and contingent reward behaviors and fewer management-by-exception and laissez-faire behaviors than men. Madden's second study investigated prescriptive stereotypes about the importance of leadership styles for the promotion of women and men to different levels in organizations and found that inspirational motivation was perceived as more important for men than women and was especially important for promotion to CEO. In contrast, individualized consideration was perceived as more important for women than men and especially important for promotion to senior management. Consistent with these stereotypical beliefs about leadership, women interested in promotion may be well advised to blend individualized consideration and inspirational motivation (Madden 2011).

### Design/Methodology/Approach

First, I reviewed the research evidence on CEO leadership and gender. Then, I explored gender stereotyping. Furthermore, I considered the role of CEO leadership and gender in organizations. This review serves as the foundation for the discussion of three perspectives regarding CEO leadership and gender: tendencies and social implications, gender differences in leadership style, and gender differences as a function of perception and stereotype.

### Limitations and Future Research Directions

As in any research, this study had some limitations. In the first instance, this study focused on three elements: tendencies and social implications, gender differences in leadership style, and gender differences as a function of perception and stereotype. Many other elements required discussion in regard to leadership and gender. However, future researchers might scrutinize how leadership styles differ due to gender and management levels (Jonson et al. 2010; Stelter 2002). This study only focused on transformational leadership style and transactional leadership style. It may be effective to access whether women acting in stereotypically feminine ways by applying transformational and transactional leadership are perceived as weaker leaders by their colleagues.

### Summary

In this entry, I focused on three paradigms: gender and leadership, gender differences as a function of perception and stereotype, and gender differences in leadership style. The notion that men and women are from different planets (Gray 1992, 2008) implies that their ways of leading differ innately. Some researchers supported the view of gender differences, for example, that women tend to be slightly more "transformational" (Alimo-Metcalfe et al. 2008; Bass and Avolio 1994; Eagly and Carli 2003). Reviewed literature showed a leadership difference between women and men in that women tend to exhibit a transformational leadership style, whereas male display a transactional leadership style. Female leaders tend to focus on people and relationships, whereas men place more emphasis on organizational goals and objectives.

## Change Management

Svetlana S. Holt

Woodbury University, Burbank, CA, USA

## Synonyms

Leading change; Organizational change; Organizational development

## Introduction

Contemporary organizations exist in social, political, and economic environments that change rapidly and unpredictably. Organizational leaders succeed with such changes by looking at strategy, organization design, and processes, by studying theories of change management related to the individual, group, inter-group, and organizational level. They apply modern-day methods of diagnosing organizations and designing interventions that will increase the effectiveness of their organizations. The complexities in developing a culture of change and continuous improvement

within an organization include determining its readiness for change, uncovering the reasons for resistance to change and tactics for coping with such resistance.

When thinking about managing change, some people assume that organizations are well-integrated entities within which everybody works harmoniously together. Some believe that decisions are made logically and rationally, that people share similar views of the world around them and that they act to promote the interests of the organization as a whole. This is rarely the case. Overwhelming majorities of transformation leaders anticipate the number of change initiatives in their organizations to increase over the next years, with approximately 80% of these initiatives expected to fail (Baran et al. 2018). Change is hard. Rapidly advancing capabilities, including big data analytics, artificial intelligence, and cloud computing, can technically enable companies to continuously and quickly evolve. And in a fierce and competitive marketplace, marketing and other digital business leaders are compelled to unsettle their organizations before they get disrupted.

The gradualist paradigm posits that an organization changes and develops through a continuous process of incremental adjustment and that these changes accumulate over time to ensure that the organization is always aligned with its external environment (Hayes 2018). While a process of continuous gradual adjustment might seem ideal at first thought, evidence suggests that most organizations experience change as a discontinuous process often referred to as a pattern of punctuated equilibrium (Cummings and Worley 2003). Punctuated equilibrium involves long periods of low intensity incremental changes interposed by short bursts of high-intensity discontinuous change.

Kurt Lewin's is one of the classic theories of change, which posits that change typically involves a three-step process that follows the sequence of unfreezing, or removing the barriers which maintain the status quo, moving the organization to a new state, and refreezing to fuse the change (Schein 1996).

Another theoretical approach suggests that in order for change to be successful, leaders need to follow an 8-step process, beginning with establishing a sense of urgency, forming a

powerful coalition, and creating and communicating a compelling vision. After these steps, change leaders proceed to empower their personnel to act on the vision, plan for short-term wins, and finally, consolidate improvements and institutionalizing the newly developed organizational culture (Kotter 2012).

## The Shifting Nature of Change

Over 70% organizations report they are near or past the point of "change saturation," where they cannot absorb any more learning (Cummings et al. 2016). The reason may be that although key principles of change have remained relatively the same, the practice of change management has evolved due to globalization, intensified scrutiny from government and consumers, multi-generational workforce, digital transformation, gig economy, artificial intelligence, and increased mobility and connectivity. Large companies are often engaged in multiple simultaneous change initiatives across several geographies. A combination of art and science, change management is now regarded as internal capability (Cummings and Worley 2003), with new approaches to stakeholder engagement, integration of neuroscience, environment psychology, sustainability, and mindfulness.

Indeed, for many organizations, a 5-year strategic plan – or even a 3-year one – is a thing of the past. Organizations that once enjoyed the luxury of time to test and roll out new initiatives must now do so in a compressed period while competing with tens or hundreds of existing (and often incomplete) initiatives (Stouten et al. 2018). In this dynamic and fast-paced environment, competitive advantage will accrue to companies with the ability to set new priorities and implement new processes more quickly than their rivals. Consequently, while traditional workshops and training courses have their place, they are not effective at scale and are slow moving (Pieterse et al. 2012).

Accordingly, traditional training courses and workshops are no longer effective, and new approaches to the practice of change are rapidly finding their ways into the realm organizational development and change – tactics and

technologies which allow specific personalized information relevant to the place and time to forgo hierarchical protocols and connect impacted parties immediately. Just-in-time feedback in the form of daily SMS messages via wearable technologies with personalized performance information and customer insights allows for behavior adjustments in real time. Online forums, digital dashboards, adaptive interfaces, and integrated social platforms promote transparency, community, and trust.

## The Challenges of Managing Change

Many people are reluctant to change because they prefer the status quo to an uncertain future, or they anticipate that the cost of changing might outweigh the benefits. Deep structures are the fundamental choices that determine an organization's pattern of activity. They act as forces for inertia that work to maintain the status quo. Pressure to deliver short term results directs managers' attention toward improving internal alignment in order to increase efficiency and diverts their attention away from external alignment (Hayes 2018).

Sometimes leaders fail to create the capacity to get things done because they fail to build coalitions committed to achieving the vision. A feature of modern organizations is interdependence, where no one has complete autonomy, and where most members of the organization are tied to many others by their work, technology, management systems, and hierarchy. These interdependencies point to a need for "lateral leadership" to create commitment to a shared understanding of what needs to be done. In those situations where there is a clear and shared sense of direction, committed stakeholders, including subordinates, are more likely to feel able to take action without encountering undue conflict with others or being reprimanded by superiors (Worley and Mohrman 2014). But sometimes this shared sense of direction is lacking because the vision is poorly communicated. The time taken to pass through all the phases can also vary greatly, and although presented as a purely linear process, people may regress and slip back to an earlier

stage in the process or get stuck at any phase and not complete the cycle.

## Implications for Managers

Implementing change begins with evaluating applicable organizational development methodologies which promise to facilitate the most effective use of people. Identifying and understanding strategies and tactics to develop and enhance leadership competencies in oneself and in others is equally important (Cummings and Worley 2003).

Organizations can be conceptualized as a collection of individuals, groups, and communities of practice, each pursuing their own objectives. When there is a conflict of interests it is the power and influence of those involved that determines the outcome – rather than logic and rational argument. Consequently, those responsible for managing change cannot afford to ignore issues of power and influence. Leaders must recognize that there will often be a time lag between the announcement of a change and an emotional reaction to it; different individuals or groups will progress through the cycle at different rates and in different ways because the change might affect them differently (Stouten et al. 2018). Change managers, therefore, need to beware of getting out of phase with their staff, with the implication of staying engaged. They need to communicate, be active, and visible throughout the duration of the project; they need to tap into people's emotions, address individual responses, give people more control, and help them help themselves. To continue seeing the big picture, they need to be realistic about what is possible and not try to do too much at once.

Digitizing the following areas in particular is recommended by change scholars and practitioners to help make internal change efforts more effective and enduring (Hayes 2018). First, it is providing timely feedback: the best feedback processes are designed to offer the right information when the recipient can actually act on it. Such feedback gives recipients the opportunity to make adjustments to their behavior and to witness the effects of these adjustments on performance.

Second, personalization is about filtering information in a way that is uniquely relevant to the user and is showing each individual's role in and contribution to a greater group goal. An easy-to-use system can be an effective motivator and engender positive peer pressure (Cummings et al. 2016). Creating direct connections among people across the organization allows them to sidestep cumbersome hierarchal protocols and shorten the time it takes to get things done. It also fosters more direct and instant connections that allow employees to share important information, find answers quickly, and get help and advice from people they trust. In increasingly global organizations, communities involved in change efforts are often physically distant from one another. Finally, providing an outlet for colleagues to share and see all the information related to a task, including progress updates and informal commentary, can create an important connection. More sophisticated tools can also show individual contributions toward the common goal. This type of communication makes the change feel more urgent and real, which in turn creates momentum that can help push an organization to a tipping point where a new way of doing things becomes the way things are done (Baran et al. 2018).

A relatively new approach to organizational development, the so-called "lean change," is to co-create change with the people affected, in whichever manner and sequence makes sense in context. This approach implies wide application of experiments rather than traditional "change activities." Experimenting provides opportunities to further experiment, a major mindset shift from the concept of a carefully crafted set of dependent change activities laid out on a plan, with a defined start and end point. The "lean change" method sees change as a social movement which can be started anywhere in the organization and the role of the change agent not as a designer and a planner, but as a scanner, an enabler, and a protector of the disruptors, working hard to constantly maintain an open dialogue, listening, empathizing, and engaging in ongoing co-creation with those affected (Stouten et al. 2018).

## Concluding Thoughts

Change management is an evolving discipline that itself has transformed significantly over the last few decades. Although the key principles of leading change remain relatively the same, the practices of change management have to advance to meet the ever-changing needs of people in today's organizations. Trends such as globalization, the gig economy, a multigenerational workforce, increased mobility, digital transformation, and artificial intelligence are forcing organizations to set aside traditional, linear approaches in favor of refreshed, feedback-driven approaches to creating and implementing successful organizational change, as the advent of digital change tools comes at just the right time. Organizations today must simultaneously deliver rapid results and sustainable growth in an increasingly competitive environment. They are being forced to adapt and change to an unprecedented degree: leaders have to make decisions more quickly; managers have to react more rapidly to opportunities and threats; employees on the front line have to be more flexible and collaborative. Mastering the art of changing quickly is now a critical competitive advantage.

## Charismatic Leadership

David C. Hofmann

Department of Sociology, University of New Brunswick, Fredericton, New Brunswick, Canada

### Synonyms

Inspirational leadership; Transformational leadership

### Definition

Charismatic leadership is a type of leader-follower relationship that most often arises during times of social, political, economic, and/or religious crisis, particularly when other forms of leadership are seen as incapable of resolving the associated turmoil. Rather than being grounded in more stable forms of leadership premised upon tradition, custom, or laws, the authority wielded by charismatic leaders is based solely upon followers' recognition of some form of extraordinary quality or trait in their leader that is not accessible to the average person. Followers' recognition of, and devotion to, a charismatic leader can inspire atypically strong commitments aimed at helping achieve the leader's stated mission or goals. Therefore, in its purest form, the authority wielded by charismatic leaders is anti-

institutional and is often a force for social, religious, political, and/or organizational change.

## Charismatic Leadership

The social scientific study of charismatic leadership is robust and multidisciplinary, with notable contributions from disciplines such as management studies (e.g., Bass 1985; Conger and Kanungo 1988; Gardner and Avolio 1998), psychology (e.g., Fuller et al. 1996; Howell and Avolio 1993; Oakes 1997), anthropology (e.g., Wilson 1975), sociology (e.g., Friedland 1964; Jooisse 2014), political science (e.g., Burns 1978; Madsen and Snow 1991; Willner 1984), religious studies (e.g., Couch 1989; Dawson 2002; Wallis 1982), security studies (e.g., Hofmann and Dawson 2014; Hofmann 2015; Ingram 2013), education (e.g., Slater 1995), and more.

Despite the varied disciplinary, epistemological, and methodological approaches to the study of charisma, scholars widely recognize sociologist Max Weber's (1968) work on legitimate domination (i.e., the recognition of an individual, position, or office's right to exercise authority over others) as the foundation for social scientific inquiry into the social dynamics involved in the emergence, maintenance, and institutionalization of charismatic leadership. Weber identifies three ideal types of legitimate domination:

- (1) *Traditional authority*, whereby individual leaders or an established office wield authority based upon long-standing traditions or customs. Examples of traditional authoritative leaders include monarchs or tribal chieftains.
- (2) *Rational-legal authority*, which refers to legally established offices or positions found within an impersonal established order. In the case of rational-legal leadership, it is the position or office that wields legitimate authority and not the actual individual holding the position. Examples include judges, police officers, and elected officials.
- (3) *Charismatic authority*, which Weber (1968, p. 48) defines as:

A certain quality of an individual personality by virtue of which he is set apart from ordinary men and treated as endowed with supernatural, superhuman, or at least specifically exceptional powers or qualities. These are such as are not accessible to the ordinary person, but are regarded as of divine origin or as exemplary, and on the basis of them the individual concerned is treated as a leader.

As this often quoted excerpt suggests, the authority of charismatic leaders is based solely upon followers' perceptions of the "special" nature of their leader rather than being grounded in the recognition of the legitimate authority of a particular tradition, custom, or law. Weber notes that traditional and rational-legal authority tend to be found within stable systems of order. In contrast, pure forms of charismatic authority operate outside the normal social, traditional, and/or legal constraints placed upon traditional and rational-legal forms of authority. Since their authoritative legitimacy is not fettered by conventional and institutional rules, norms, or regulations, truly charismatic leaders are often capable of challenging the status quo and are capable of bringing about some form of meaningful social, religious, political, and/or organizational change.

### The Charismatic Bond

It is not the possession of some sort of innate extraordinary trait or ability that is the defining feature of a truly charismatic leader, but rather the fact that *others* recognize the "special" nature of the leader. This recognition and the subsequent relationship that emerges between the charismatic leader and their followers are known as the charismatic bond. The bond formed between a charismatic leader and their followers is a complex process of negotiation that is based upon a rational exchange of wants and needs: the leader gains authority, adulation, and power, while followers obtain other social benefits such as feelings of self-worth, recognition, affection, a sense of purpose, and more (see, Wallis 1982). The collective multidisciplinary scholarship on charismatic leadership has largely focused upon understanding and exploring the social dynamics involved in the creation, maintenance, and institutionalization

(also known as routinization) of the charismatic bond.

### Emergence of Charismatic Leaders

Scholars note that charismatic leaders are most likely to arise during "times of psychic, physical, economic, ethical, religious, [and/or] political distress" (Weber 1968, p. 19. See also, Bass 1985, pp. 55–57; Devereux 1955; Friedland 1964, pp. 22–24; Tucker 1970, pp. 80–86; Wallis 1982, p. 170). In his discussion of the social conditions that give rise to charismatic leaders within religious movements, Lorne Dawson (2011) highlights five factors that contribute to their emergence:

- (1) The perception of an acute, chronic, and ultimate crisis.
- (2) The breakdown of existing forms of traditional and rational-legal forms of leadership due to one or more crises.
- (3) Preexisting social, cultural, and/or traditional support for the emergence of charismatic leaders.
- (4) Resonance of the charismatic leader's message with their target audience.
- (5) The charismatic leader must truly believe they are the only one who is capable of ending the crisis in question and convince others of this fact.

While these factors are not wholly analogous across different contexts (e.g., politics, business, and so on), they highlight the importance of pre-existing sociocultural and political conditions as well as larger strategic considerations in catalyzing the emergence of charismatic leaders.

### Maintaining the Charismatic Bond

Since charismatic leadership is reliant upon managing followers' perceptions of the extraordinary nature of the leader, it is inherently fragile when compared to the more stable forms of leadership that are based upon long-standing traditions, customs, or laws. This means that charismatic leaders are presented with unique challenges which they need to successfully navigate in order to maintain the charismatic bond (see, Dawson 2011,

pp. 86–98). As Weber (1968, pp. 22–23) explains, charismatic leaders must continually provide evidence to their followers that they are indeed special and thus worthy of being followed:

The charismatic leader gains and maintains authority solely by proving his strength in life. If he wants to be a prophet, he must perform miracles; if he wants to be a war lord, he must perform heroic deeds. Above all, his divine mission must ‘prove’ itself in that those who faithfully surrender to him must fare well. If they do not fare well, he is obviously not the master sent by the gods.

In other words, charismatic leaders who repeatedly fail to reinforce followers’ perception of their extraordinary nature risk losing their authoritative legitimacy and may lead to abandonment by their adherents.

### Routinization of Charismatic Authority

Weber notes that charismatic forms of authority will inevitably routinize (i.e., become institutionalized) into more stable forms of traditional and rational-legal authority. Successful charismatic leaders who are capable of maintaining the charismatic bond over a long enough period will eventually see their message formalized and codified by their followers. For example, religious figures like Moses, Jesus, and Muhammad challenged contemporary religious views, gathered a following based upon the recognition of their charisma, and had their teachings recorded into holy texts that then became pillars of different religious practices. In the case of charismatic business leaders, figures like Steve Jobs and Lee Iacocca left behind legacies that adherents attempt to emulate and integrate into their business practice in order to achieve similar successes. In simpler terms, successful charismatic leadership is something that is *transitory*. It arises during times of turmoil, offers a solution to perceived crises, and presents an alternative viewpoint/method/approach. The teachings, goals, and messages of successful charismatic leaders will then become integrated and institutionalized into more stable forms of authority.

### Summary

Charismatic leadership is based upon a bond that is established between a leader and a group of followers who grant the leader authority based upon their recognition of some form of extraordinary, special, or superhuman trait or quality within the leader. In its purest form, the authority wielded by charismatic leaders is anti-institutional, crisis-driven, and fragile. It therefore serves an important purpose in challenging long-held traditions, customs, laws, and norms with the purpose of bringing about some form of meaningful change.

Child labour and child rights; Child labour in supply chain; Informal economy

### Introduction

Over the last three decades, high-profile global brands and companies have been scrutinized for their child labour practices in supply chains. Child slavery, usually in the form of forced labour, is included under the term “child labour”. Child labour is a complex issue arising out of lack of access to education, weak enforcement of labour laws, lack of women’s empowerment, poverty and insufficient social protection for the poor (WEF 2020). Child labour has lifelong outcomes for the working child and a cost for the economy by favouring unskilled labour over increased investment in human capital. In hazardous industries, it creates health problems that affect children’s physical and mental well-being as adults. In recent years, going beyond child labour, children are also a vulnerable group and exploited as consumers. The recognition that businesses have a crucial role in mitigating the negative impacts on children is growing. The UN Guiding Principles (UNGP) (UN Guiding Principles and Transnational Business Governance) on business and human rights recognize children as a vulnerable group and urge companies to exercise care in addressing their rights. In 2012, UNICEF released the Children’s Rights and Business Principles (CRBP), outlining

how businesses can embed a child rights perspective into their operations. Yet evidence suggests that from an implementation perspective, there is a long way to go. This chapter provides a quick overview of child labour in global supply chains, children as rights holders and how a child rights perspective aligns with the Sustainable Development Goals (SDG) and the UNGP to impact the future positively.

### Current Realities, Alarming Statistics

Child labour refers to two concepts: work undertaken by children below the legal minimum working age (in most countries at least 15 years) as defined by ILO (International Labour Organization) Convention No. 138 and worst forms of child labour by Convention No.182. An interim declaration minimum age of 14 years is also possible in countries with insufficiently developed economies and education systems (ILO 2017a). According to the International Labour Organization (ILO), nearly 152 million children – 64 million girls and 88 million boys – are in child labour globally, accounting for almost 1 in 10 children worldwide. Roughly half of those in child labour are in hazardous work that directly endangers their health, safety and moral development (ILO 2017b). Children in forced labour, the worst form of child labour is 4.3 million. Child labour occurs in all industries but is exceptionally high in the agriculture sector. Other sectors include cocoa, coffee, cotton, sugarcane, tobacco, garments/fashion and artisanal mining in gold, cobalt and mica (OECD 2019). However, there are wide variations across different countries and even within the same country on child labour prevalence.

In general, developing countries have a robust agricultural economy, and therefore, the prevalence of child labour is high. With the increased use of technology in agriculture, child labour incidence decreases (OECD 2017). Similarly, developing countries are transitioning into manufacturing economies and attract foreign direct investment to promote economic prosperity (► [Social License to Operate](#)). One of the sources of competitive advantage for manufacturing

organizations in these countries is the availability of a vast and cheap labour force. Prior research shows that child employment is more frequent in countries with higher poverty rates and that growth in export sectors appears to have little influence on the incidence of child labour (OECD 2019). These countries are caught in a double bind: on the one hand, their competitive advantage is a low-cost, often low-skilled, labour, and this tends to attract jobs that are low value (► [Ethical Issues Facing Domestic Workers](#)). Child labour is employed to reduce labour cost. On the other hand, poverty is endemic in these countries. Parents force children to supplement the family income. Therefore, the vicious cycle of vulnerable children in low-cost, low-value jobs gets perpetuated, even as economic development increases.

### Global Supply Chains and Child Labour

Globalization has allowed companies to outsource low-wage routine jobs to developing countries since labour is cheaper in some parts of the world than in others. As supply chains become global, the risk of child labour's presence deeper in the supply chain is real in almost all industries. Not only does this mean lower wages further down the supply chain, but it may involve poor working conditions and lack of access to basic human rights (Winstanley et al. 2002). A recent study involving 48 countries indicates that child labour demand grows when production forms requiring only low-skill levels gain importance (ILO 2018). Reducing low-skill industries reduces child labour. While high-profile supply chains get media attention, child labour in domestic and national supply chains goes unnoticed with no scrutiny and oversight.

### Informal Economy and Child Labour

Several domestic supply chains overlap significantly with the informal economy. Informal economy refers to a “diversified set of economic activities, enterprises, jobs, and workers that

are not regulated or protected by the state (Chen 2012)". It includes self-employed, small unregistered enterprises and wage employment in unprotected jobs like casual, temporary and part-time workers (Chen 2012). Workers in the informal economy are often denied their rights at work, lack occupational safety and health support and have inadequate social protection. Prior research (Chen 2012) reports that when enterprises are downsized or shut down during periods of economic disruption, the laid-off workers who cannot find alternative formal jobs often work in the informal economy. Adult workers demand higher wages, and child labour becomes even more attractive from a labour cost perspective.

In summary, child labour is a complex problem. Governments, UN agencies and civil society have played a crucial role in mitigating child labour's negative impact for the past seven decades. Beyond child labour, some new issues on children as consumers of products and technology users are becoming critical for organizations to recognize from a rights perspective.

### Child Rights in Technology

During the pandemic, technology has significantly mediated children's lives. One in three Internet users globally is a child. While technology provides better access to learning, children can be exposed to inappropriate or potentially harmful content when seeking information online. Many children are also bystanders to cyberbullying. Exposure to online risks may result in psychological harm to the child. This experience can hurt children's well-being over time. Technology companies have come under increased scrutiny from governments on this issue. As an emerging area of concern, businesses need to focus on a more holistic child rights agenda in their activities. Companies have approached human rights-related issues either by feigning ignorance, showing indifference or involving themselves (Winstanley et al. 2002).

### Framing Child Rights as Business Responsibility

This section examines the child rights policy framework that businesses can adopt if they choose to involve themselves on this issue and provides suggestions on how companies can integrate child rights principles into their strategy and actions to protect, respect and remedy child rights.

### Policy Framework

In 2011, the UNGP outlined corporate responsibility by explicitly recognizing that business enterprises' actions can infringe human rights (► [Human Rights, the Capability Approach and Corporate Responsibility](#)), directly or indirectly, across a spectrum of human rights. UNGP urged enterprises to respect human rights (► [Human Rights Impact Assessments](#)) of specific groups or populations that require particular attention, like children (UNGP 2011). The Children's Rights and Business Principles embed a child rights lens on the UN Guiding Principles.

The ten principles of the CRBP go beyond labour and workplace to include the impact on children's rights in the marketplace, community and environment. Issues such as responsible marketing and advertising of products to children, respecting children's rights in land acquisition, safe products and services for children, decent work and protection and children's safety feature in CRBP principles.

### Translating Intent to Action

The UNGPs encompass three pillars outlining how states and businesses should implement the framework: the state duty to protect human rights, the corporate responsibility to respect human rights and access to remedy for victims of business-related abuses. In the case of child rights, most developing countries have laws that protect child labour. They have also ratified the ILO conventions. However, weak enforcement has been a severe roadblock to the eradication of child

labour. Strengthening the laws and robust implementation is key to ensuring the state's accountability. International bodies like the UN and development agencies need to work in tandem with governments to ensure that child rights are protected and respected.

Under the UNGP, companies have to make a policy commitment and articulate human rights due diligence process to identify, prevent, mitigate and account for how they address adverse impacts. Companies have to set up mechanisms for remediation of any adverse human rights impacts they cause or contribute (UNGP 2011). CRBP provides several tools and instruments for companies to translate their intent of respecting child rights into action.

A key mechanism proposed is the Child Rights Impact Assessments. It guides companies in assessing their policies and processes related to their responsibility to respect and support children's rights. UNICEF has created a tool covering all aspects of child rights policy commitment and implementation that organisations can use (UNICEF 2013). Companies are required to do Due Diligence as a part of the UNGP implementation. Due Diligence ensures that a company addresses child rights at all stages of the supply chain, including raw material extraction. It forms part of an enterprise risk management process and focuses on children as rights holders. Businesses will need to examine the severity and likelihood of child rights and prevent, mitigate and remediate child rights violations. Due Diligence requires continuous engagement with stakeholders and commitments to make changes to remedy child rights violations in a phased and gradual manner.

Disclosures are a vital mechanism through which companies report their actions and outcomes. Disclosures signal to the market and key stakeholders the companies' intent to take responsibility for their actions. Six years after CRBP, the uptake is still low, and businesses appear to be struggling to identify ways to translate child rights into action in their spheres of influence (Capaldi 2019). More needs to be done by all stakeholders to integrate the CRBP into the Human Rights Due Diligence process in the UNGP.

## Conclusion

Within their sphere of influence, companies can raise awareness of child rights, including child labour, in their supply chain. They can formulate, implement and monitor affirmative policies on child rights mitigation that encourage stakeholders to address related issues. They can engage with civil society organizations to effectively implement acceptable practices in the field of child rights. They can ensure that contracts with supply chain partners contain clauses related to promoting and protecting child rights. Collaborations with civil society organizations engaged with child rights issues can help companies align their actions better with the SDG. It is here that the need for enterprises to hold "Responsive Responsibility" (Deva 2014) where they commit to protect and fulfil children's rights by engaging in positive action becomes essential. "Responsiveness" focuses on strategy and action, while "responsibility" focuses on corporations' duties on a given issue. Such an attitude of responsive responsibility will allow companies to proactively engage with child right and identify implementation opportunities to strengthen responsible business conduct.

Progress on child rights requires collaboration across three key actors. An active government policy response, a vigilant civil society and a proactive corporate response that addresses the array of factors that push or pull children into child labour or infringe on child rights are required to shape a world that supports child rights. The positive role of corporations as a force for good will only be evident when child rights take centre stage in the human rights discourse. As Nobel Laureate Kailash Satyarthi notes, "Every child matters. If we fail our children, we are bound to fail our present, our future, faith, cultures, and civilizations as well".

## China and Business Ethics

Qinqin Zheng

Department of Business Administration,  
School of Management, Fudan University,  
Shanghai, China

## Synonyms

Chinese traditional philosophies on business

## Definition

Business ethics is a collection of moral principles or a set of values dealing with what is right and wrong, good or bad, that governs the behavior of a group or members of a group (Saul 1981). In China, entrepreneurs’ ethical concept of judging value, benefit, good, and evil naturally penetrates into business ethical practice. Most Chinese entrepreneurs draw ideas from traditional Chinese philosophy and apply them to their daily business practice. Based on the philosophies of Confucianism, Taoism, and Buddhism, Chinese entrepreneurs have refined these perspectives into business ethics principles that can be applied to their own business management practices.

## Description

Originating from the traditional Chinese philosophies, business ethics has played an important role in China’s social stability and economic development. Chinese philosophies have long been dominated by three schools of masters’ thoughts – Confucianism (Ru Jia), Taoism (Tao Jia), and Buddhism (Fu Jia). Chinese epistemological systems are based on a collective view and focus mainly on the explanation and rationality of the “internal world.” The basic philosophical elements of Confucianism, Taoism, and Buddhism, as the dominant Chinese ideology and culture, were generally positive and benevolent in nature. Fulfilling business ethical principles (such as

trust, trustworthiness, and cooperativeness) can help firms to build long-term value and, hence, create a competitive advantage (Jones 1995). Since 2012, the Chinese government has attached great importance to cultivating and practicing the socialist core values. Prosperity, democracy, civility, and harmony are the values at the national level. Freedom, equality, justice, and the rule of law are the values at the societal level. Patriotism, dedication, integrity, and friendship are the values at the individual level of the citizens. These 24 values form the basic contents of the socialist core values. The socialist core values are derived for the traditional Chinese philosophies and are now widely applied to economic development practice and social governance in China.

- Confucianism has a profound impact on the business ethics of Chinese enterprises. Due to the historical and cultural endowment, Chinese entrepreneurs are interested in the integration of Confucianism with enterprise management; for example, the sentence “do not do to others what you do not want” in the *Analects* of Confucius has infected and inspired many businesspeople in China. Business should follow the needs of people and respect the needs of the market. To formulate an employment system and foreign public relations strategy, Chinese enterprises should follow the needs of the talents and the needs of society. For many aspects of business, Chinese managers use this sentence to deduce such ideas as “transposition thinking,” “others are their own mirror,” and so on.
- Taoism also has a very significant influence on contemporary business ethics in China. Taoism is rooted in an understanding of the “way” (i.e., the Tao), which is the shapeless force that brings all things into existence and then nurtures them; for example, Yin-Yang philosophy, which is one of the central notions of Taoism, provides a holistic comprehension concerning our complex reality. It treats two opposite elements of any paradox as a partial trade-off as well as partial synergy within a spectrum of holistic and dynamic balancing (Li 2016). Many Chinese enterprises thus adopt Yin-Yang

balancing as a guiding frame and apply this frame of thinking to paradoxical issues in a complex and yet interdependent business world.

- The Buddhist philosophy is widely adopted by enterprises in China. As one of the three major religions in the world, Buddhism is profound and rich in thought. There are also many business people who devote a lot of time to meditation. Buddhists do not easily become anxious because of their spiritual support and inner calm. They are also more flexible, coordinated, and cooperative and have less sense of rejection of their work. Accordingly, Buddhism helps to improve the working atmosphere and team integration within enterprises in China. As a classic reflection of the Buddhist philosophy, “give-up” is the guiding ideology that entrepreneurs often use when weighing up business value. In a company with a strong Buddhist atmosphere among the employees, their sense of value and identity will also be significantly enhanced.

## Business Ethics Revival in China

The past 40 years witness China’s remarkable economic progress with market-oriented reforms, heightened competition in deregulated sectors, and successful utilization of foreign direct investment. However, moral degradation or demoralization had also once prevailed as a parallel to this impressive economic progress (Zheng et al. 2014). Moral degradation can complicate firms’ engagement in ethical and social conduct. The traditional cultural values that shape business behaviors are changing or, more specifically, are deteriorating. The traditional Chinese Confucian ethics proposes moral rules such as “righteousness” and “sincerity,” emphasizes commercial ethics that forbade the sale of poor quality products and cheating in transactions, provides a strict administrative system to regulate prices, quality, and standards and recommends punishment for those who violated the regulations. When a social system lacks appropriate commercial ethics or moral values, it incubates a propensity for firms

to use anomalous means to achieve their desired ends without guilt. Such demoralization is exemplified by widespread sales of counterfeit products and unsafe goods, stock market manipulation, fraudulent dealings, and so forth (Wright et al. 2003).

Meanwhile, these societal moral hazards arouse public awareness of business ethics and CSR in China. For example, experiencing the massive 2008 contaminated milk scandal in China, a disturbed public severely condemned those dairy factories involved and refused to purchase their products. Consequently, related guilty firms suffered significant performance decrease and even bankruptcy (Ding 2009). In recent years, China's government and industrial organizations have endeavored to establish ethics offices, and to develop new ethical policies and mandatory ethics training. After CSR guidelines were issued by the Shenzhen and Shanghai stock exchanges in 2006 and 2008, respectively, China's listed firms have been encouraged to publish annual CSR reports (Zheng et al. 2015). As ethical business behavior is becoming increasingly important and as ethical questions are gaining more significance in China, firms today are confronting a much stronger requirement for business ethics and CSR. Therefore, it is critical that firms maintain an attitude of ethical consciousness. Indeed, business ethics has revived in China.

## Chinese Approach to Business Ethics

Daryl Koehn

Institute for Business and Professional Ethics,  
DePaul University, Chicago, IL, USA

## Synonyms

Bribery; Confucianism; Intellectual property; Pollution

## Introduction

There is no single Chinese approach to business ethics. Even this nomenclature is somewhat problematic, for it includes both what non-Chinese have written about the practice of business within China and what Chinese authors themselves have argued concerning business in Taiwan, Hong Kong, and mainland China and among ethnic Chinese. This entry briefly identifies topics that have received significant attention in English-language journals from both of these groups and then discusses some of the approaches that have been adopted by thinkers in their analyses of business as it is practiced in these locations.

## Key Topics in the Chinese Context

Key topics in the Chinese context include corruption, the government-corporation nexus, creation of a middle class, environmental pollution, intellectual property, and *guanxi*. Corporations and the government have historically been intertwined. The Chinese army has significant business holdings within China, and Western companies have been accused of paying bribes as part of “pay to play” schemes. The Communist Party of China (CPC) claims to have investigated more than one million corrupt officials, and researchers have reported that graft in Beijing is positively correlated with public perceptions of corruption at the local party level (Zhang 2017). Numerous multinational companies (Michelin, Bridgestone, etc.) have been found guilty by Chinese authorities of commercial bribery.

It is often alleged in the Western press that Chinese companies are working with the government to commit corporate espionage and even to facilitate hacking of personal, corporate, and government computer systems (Clayton 2014). Chinese-developed firmware has been discovered on over 700 million Android smartphones. The hidden software was used to track user movements (Bing 2016). As of 2015, all telecomm and Internet companies doing business in China must assist Chinese law enforcement when it comes to decrypting any user data that Chinese officials deem useful in the fight against alleged terrorists.

As with other countries on the path to industrialization, China’s push to modernize its economy has had mixed results. It has lifted millions out of poverty, creating a substantial middle class. It has also resulted in widespread and serious air and water pollution. Nitrogen oxide and sulfur oxide emissions as well as carbon monoxide increased substantially in the early 2000s, although the Chinese appear to have improved surface water quality in its southern provinces (Vennemo et al. 2009) and have cut suffer dioxide emissions substantially since 2007 by imposing strict controls on the burning of coal (Li et al. 2017).

Intellectual property generally has not been well-protected by Chinese authorities. Firms that

share intellectual property with Chinese firms in order to gain access to the Chinese market have often found themselves on the losing end of the trade. They give up information and later find that Chinese courts favor their partners’ interests at their expense. In particular, the Chinese government has pursued policies aimed at appropriating technology in the fields of power generation, information technology, high-speed rail, and transportation (Hout and Ghemawat 2010).

Researchers continue to be interested in ethical aspects of Chinese business practice that appear to be distinctive. The Chinese often rely upon familial connections and personal relationships forged at high school or university when doing business and solving problems or issues that arise in the course of economic transactions. This reliance on relationships (*guanxi*) stems at least in part from Confucian emphasis on reciprocal personal relationships (Yin 2017) and from the perceived weakness of the rule of law and contract enforcement within China, which encourages businesspeople to go through the backdoor (*zou houmen*) (Wedeman 2012). Chinese scholars have examined whether there are gender differences in the use of *guanxi* (Leung 2000), what role *guanxi* plays in corrupt economic transactions, and how ethically sound *guanxi* should be distinguished from its morally corrupt cousin.

It is also useful to locate business ethics research by the Chinese or about China in the context of macro-, meso-, and micro-levels. Much of the writing on business ethics in English by mainland Chinese scholars has focused on the macro-level with discussions regarding the effects and ethics of the transition over the past few decades to more of a market economy. Papers on corporate culture and ethical climate from a Chinese perspective and/or regarding Chinese firms are beginning to appear (Deshpande et al. 2011; Hawes 2008; Davies 2007), but this research stream to date is rather thin. A few articles have examined culture at China’s state-owned enterprises (Ralston et al. 2006). Chinese scholars have to date done relatively little work to date in incorporating behavioral ethical discussions of behavior ethics topics such as framing, anchoring, and rationalization. While discussions of

corruption abound (see above), less interest has been paid to topics associated with white collar crime (e.g., causes of accounting fraud). A growing body of work by scholars from China and Taiwan and by ethnic Chinese centers on the relevance of Confucian ideas to business practice (Ip 2009; Lam 2003) and on ways in which Confucian virtue ethics overlap with and differ from Western virtue ethics (Chan 2008; Koehn 2013). For example, Confucianism does not focus on practices with internal goods in the way that Alasdair MacIntyre's virtue ethics does, but Confucian rituals (*li*) might be analogous to such practices in some ways.

## Chinese Stock Market

Qinqin Zheng

Department of Business Administration, School of Management, Fudan University, Shanghai, China

## Synonyms

China's security market

## Definition

The People's Republic of China stock market, also known as the Chinese stock market, dates back to the early 1990s. As an emerging and rapidly growing stock market, the Chinese stock market has made remarkable achievements in a short span of several decades. The establishment of the Shanghai stock exchange and the Shenzhen stock exchange in 1990 marked the beginning

of the development of the Chinese stock market. Currently, the network of trading and settlement of both the Shanghai stock exchange and Shenzhen stock exchange has covered all parts of the country. By the end of 2018, there are over 3000 companies listed on the Chinese stock market. China's stock market is featured as a pure order-driven centralized market. All investors have equal access to market information, and all orders are visible without any dark pools.

## Description

The Chinese stock market has played a prominent role in promoting the reform of the state-owned enterprises and China's economic restructuring. Originally, the dominant characteristic of the Chinese stock market was the state-owned shares, and the legal person shares of listed companies were controlled as noncirculating shares. The large non-tradable component was held by corporate founders and central or local governments. As a result, only tradable shares were traded on the market. However, the stock index is still calculated in accordance with the total share capital, which then enabled traders to enjoy greater control with fewer shares. In order to revitalize the state-owned assets, the China Securities Regulatory Commission has introduced a number of programs designed gradually to solve the problem of the non-circulation of state-owned shares since 2001.

After decades of development, the Chinese stock market has strengthened the supervision on the behavior of stock market participation by introducing a series of administrative regulations and rules, such as prohibition of insider trading and securities fraud (Shanghai stock exchange 2008). The information disclosure system, listing approval system, and transaction clearing system are now well established. Meanwhile, the Shanghai and Shenzhen stock exchanges have adopted advanced online technology to facilitate seats and account management as well as the management of stock market issue releases and communication. These efforts

effectively promote the Chinese stock market and regulate the behavior of all participants.

China's stock market has a dual-share system. There are two major categories of stocks, A and B shares, that are traded on the market. The trading currency of A and B shares is different. A shares are denominated in RMB, while B shares in the Shenzhen stock exchange are denominated in Hong Kong dollars, and B shares in the Shanghai stock exchange are denominated in US dollars.

- *Shanghai stock exchange* – Authorized by the State Council, the People's Bank of China approved the establishment of the Shanghai stock exchange in December 1990. This is the first stock exchange on the mainland since the founding of P.R. China (Shanghai stock exchange 2017). Located in Shanghai, Pudong New Area, Shanghai stock exchange is engaged in loan transactions, not future trading. The main business includes bond and stock trading. Besides stock trading, bonds such as government bonds, corporate bonds, and financial bonds are also traded on the Shanghai stock exchange. On the Shanghai stock exchange, most listed companies are large or medium-sized. Listed companies on the Shanghai stock exchange cannot be traded on the Shenzhen stock exchange and vice versa. Stocks in the Shanghai stock exchange are coded 600 at the beginning for A shares and 900 for B shares.
- *Shenzhen stock exchange* – Founded in December 1991, the Shenzhen stock exchange is one of the two stock exchanges in mainland China, located in Shenzhen, Guangdong Province (Shenzhen stock exchange 2017). Besides the main board market involving several large companies, the Shenzhen stock exchange focuses more on venture capital (Growth Enterprises Market – GEM) and small and medium enterprises, which are also called small plates or the SME board. In terms of stock coding, stocks start with 002 on the small plates, and the beginning of the GEM is 3. On the Shenzhen stock exchange, stocks on

the mainboard are coded 000 at the beginning for A shares and 200 for B shares.

## The History of Market Reform

The establishment of the exchanges in Shanghai (1990) and Shenzhen (1991) opened one of the most important enterprise financing channels in China (Carpenter et al. 2015). The number of listed stocks grew rapidly from eight to more than five hundred at the end of 1996. In 1997, the China Securities Regulatory Commission (CSRC) was established as an official regulator of Chinese stock market in order to deal with rampant speculation and accounting fraud and stock price manipulation. Many policies were then published to regulate market operation and shape an efficient capital allocation platform for Chinese businesses and enterprises.

In 2001, China's entry into the World Trade Organization (WTO) became a breakthrough of market reform. Since then, the CSRC has issued more and stricter regulations to protect minority shareholders and increase accounting transparency and audit quality. The famous National Nine Rules in 2004 is an example, which has greatly deterred stock price manipulation and audit fraud (Shenzhen stock exchange 2005). Chinese government also took great efforts to promote the healthy development of stock market, such as facilitating the privatization of state-owned enterprises and encouraging foreign investors' direct investment in the A-share market.

During 2007–2009, Chinese stock market was also influenced by the global financial crisis and the following economic recession. A new round of market reform was launched to stimulate domestic economic development afterward. In 2013, the New Third Board market was formally established. It is also officially called National Share Transfer System for Small- and Medium-Sized Enterprises, serving the development of innovative, entrepreneurial, and small- and medium-sized enterprises. After listing, enterprises can issue additional shares to improve corporate credit rating and achieve fast financing. With multilevel market system, Chinese stock

market has gradually matured in providing investment and financing services for the Chinese economy.

After more than 20 years of development, Chinese stock market plays an increasingly important role in financing and optimizing the allocation of resources for the growth of China's business and economy.

## Christianity and Business Ethics

Domènec Melé  
IESE Business School, University of Navarra,  
Barcelona, Spain

## Synonyms

Christian business ethics; Christian morality in business

## Introduction

Christianity is a monotheistic religion centered on Jesus of Nazareth, the Messiah, or Christ, who was promised in the Hebrew Bible (the Old Testament for Christians). This is the world's largest religion (33% of the global population) with about 2.4 million adherents, under different denominations.

Christians believe in one God, the Creator of heavens and earth, in whom three different persons coexist – the Father, the Son, and the Holy Spirit – and in the incarnation of the Son, born from a virgin named Mary. Jesus Christ became a man to redeem humanity, saving people from sin and introducing them in the spiritual Kingdom of God, the fulfillment of which will occur at the end of time. According to Pope Benedict XVI (2005, n. 1), the heart of the Christian faith, expressing the Christian image of God and the resulting image of mankind and its destiny, can be found in this words of the Bible “God is love, and he who abides in love abides in God, and God abides in him” (1 Jn 4:16); and the next verse offers us a kind of summary of the Christian life: “We have come to know and to believe in the love God has for us” (Ib.).

Jesus elected 12 apostles to continue his mission on earth. They, together with the other disciples of Jesus, constituted the Christian Church, the first external manifestation of which can be dated to the day of Pentecost in the year AD 29. The primitive Church has suffered several schisms. Currently there are three primary manifestations of Christianity: Roman Catholicism, Eastern Orthodoxy (split off in the eleventh century), and Protestantism (started in the sixteenth century and presently with many different confessions).

Adhesion to Christian faith involves a way of life moved by the Spirit of God and based on the fellowship of Jesus Christ. This entails spirituality and morality and requires coherent behavior, including in business activity. The main source of Christian spirituality and morality is the life and teachings of Jesus Christ contained in the Gospels and other texts of the New Testament, including the letters of the apostles, as transmitters of the Jesus' teachings. The Old Testament, particularly the Law of God given to Moses, and the

exhortations of the Prophets are also part of Christian morality. In this sense, Jesus affirms that He had not come to abolish the Law or the Prophets but to fulfill them (Gospel of Matthew 5:17). Another primordial source of Christian morality, recognized by many Christian denominations, is the early Christian writers known as the “Church Fathers” largely before AD 700 (the so-called Patristic period), since they show the primitive tradition of Christian morality. They did so through catechesis, homilies, letters, and exhortation to live a Christian life.

In Christian morality, charity (*agape*, in Greek) – understood as love of benevolence for all people – is central, both as a principle and as a virtue. In Jesus' words, the first and most important commandment is that “you shall love the Lord your God with all your heart and with all your soul and with all your mind and with all your strength.” The second is “You shall love your neighbor as yourself.” He adds: “There is no other commandment greater than these” (Gospel of Mark 12:30–31). Jesus, Himself, is the model for this love: “This is my commandment, that you love one another as I have loved you” (Gospel of John 15:12). Complementarily, Jesus teaches the Golden Rule: “So whatever you wish that others would do to you, do also to them, for this is the Law and the Prophets” (Gospel of Matthew 7:12). Love requires justice as the first requirement but goes beyond; also entails compassion and mercy.

The connection between Christianity and Business Ethics is through Christian Ethics, which is not identical to Christian morality. While the latter refers to maxims, values, attitudes, virtues, and practices, the former proposes a reasonable and systematic approach which is intellectually coherent. Thus, Christian Ethics, with its internal logic, can enter in dialogue with moral philosophy or ethics.

Christian Ethics, especially in the Catholic and Protestant traditions, has influence in Western Europe and in North and South America where a substantial group of scholars are devoted to this discipline, but Africa and Asia also have an increasing number of Christian ethicists. In Russia and some other Eastern European countries, the Orthodox tradition is more dominant.

Through the ages, outstanding Christian theologians have developed Christian Ethics by employing philosophical reflection. However, there is not unanimous agreement among the different branches of Christianity on the role of reason in such a development.

## Faith and Reason in Christian Ethics

The combination of faith and reason in Christian Ethics is more evident in some traditions (Catholicism and Orthodoxy) than in others (Protestantism). The motto *intellectus fidei* (intellection of the faith) was dominant in the Church until at least the fourteenth century, with two outstanding thinkers: St. Augustine of Hippo (fifth century) and St. Thomas Aquinas (thirteenth century). The latter elaborates a comprehensive Christian Ethics which includes virtues and precepts. He took as sources the Bible, the Church Fathers, previous developments of natural moral law – drawing from Aristotle and Cicero – and Aristotelian virtue-ethics. This approach has been highly influential in many Catholic thinkers and especially in the teachings of the Catholic Church, the authority of which (*Magisterium*) unifies the essential aspects of Christian-Catholic Ethics.

Aquinas harmonized rational findings from Creation (human nature) and positive divine revelation. However, in the fourteenth century, this was contested by William Ockham, according to whom, the entirety of Christian Ethics derives from a discretionary will of God. Thus, moral obligation consists in obedience to God's commands and omits human nature. This approach – known afterward as the "Divine Commandment Theory" – had a great influence in the Protestant approach to Christian Ethics, especially in Martin Luther but also, to a lesser degree, in John Calvin – the two main reformers in the sixteenth century.

Catholic theologians developed Scholasticism, the maximum exponent of which was Thomas Aquinas, but in the fourteenth century, this school of thought fell into decay. In the fifteenth and sixteenth centuries, a revival (Italian School, School of Salamanca) brought about significant development of applied Christian Ethics in

politics, economics, and business. From the seventeenth century up to the beginning of the twentieth century, Catholic-Christian Ethics was dominated by a legalistic conception of morality and an abuse of casuistry – a rule-based reasoning to evaluate sinful actions – although with the brilliant exception of Alphonsus M. Liguori (eighteenth century), who opposed legalism and avoided positions of both laxism and rigorism. Since the mid-twentieth century, the legalistic approach has been abandoned for a more Christocentric Ethics which gives primacy to love (charity), without forgetting the rational capacity to know the Creation of God. Thus, a realistic ethics based on biblical teachings and Christian tradition, but also on human nature from an ontological perspective, has emerged – human nature, but not in the biological sense. It is an ethics based on good and virtues rather than being strictly duty based. Nevertheless, it entails norms derived from good – understood as objectively existing and concrete, not a mere concept. Recent documents have provided guidelines on the relationship between faith and reason (John Paul II 1998), and on Christian Ethics (John Paul II 1993) understood as life in Christ (Catechism of the Catholic Church 2003, Part 3), as well as on the primacy of love, which should be accompanied by truth (Benedict XVI 2005, 2009)

In contrast, the Protestant perspective stresses the significance of theological aspects, giving primacy to Scripture and emphasizing freedom; it avoids any authoritative teaching on specific issues and rejects any casuistic approach. Consequently, in Protestant Christian Ethics, there are a great pluralism and a diversity of approaches, and often rather than Christian Ethics, they talk of Biblical Ethics, based on biblical studies on morality.

To mention only a few streams within Protestantism, *Lutherans* give primordial importance to the faith and the Bible, rejecting reason and human nature as valid sources of morality as these are tainted by the effects of sin. *Calvinists* emphasize the will and are more open to natural law than Lutherans, although they do not share the metaphysical understanding of natural law of Catholics. Calvin proposed moral norms with a

tendency to a legalistic understanding of Christian Ethics. In the *Anglican* communion, there are relevant Christian thinkers who try to build bridges between Catholicism and Protestantism. *Liberal Protestantism*, in the nineteenth century, through its main representative Friedrich Schleiermacher, proposed an ethical theory for all areas of life, which included goods, duties, and virtues. Karl Barth and Reinhold Niebuhr advanced the idea of interpreting the world in which we are living in the light of our common faith and insisted that our responsibility as citizens is compatible with our faith. The Orthodox tradition includes a certain legalism but stresses the role of spiritual life and the necessity to strive for Christian perfection. Regarding the relationship between faith and reason, it has been closer to Catholic positions in certain periods and to Protestant positions in others.

Currently, although there are still marked differences among the Christian Ethics, a certain convergence is taken place, starting with the modern development of Christian Social Ethics from the late nineteenth century. Nowadays, Catholics emphasize the Bible much more than before, while many Protestants accept a moderate use of reason, also in social and business issues.

## Christianity on Business: A Short Overview

In the Patristic period, a seminal doctrine of ethics in business was introduced. This included calls for honesty in business and condemnation of unfair wealth; the legitimacy of private property was confirmed, and the obligation to share one's wealth to help people in need was stated. Loans were to be done as expression of charity, and charging interest on them was prohibited – this was considered as usury, forbidden in the Bible. We must remember that, at this time, money was seen as a measure of economic value, not something to be invested to generate more money.

Thomas Aquinas dealt with topics such as private property, integrity in honoring promises,

observing legitimate contracts, and repairing injustices, respect in dealing with and talking about people, acting with justice in buying and selling, and related topics such as just price and fraud. He also paid attention to usury. He repeated the conclusions of the early Christian writers, but with some nuances, such as certain compensation for the damages incurred through a loan. Luther endorsed the Scholastic usury doctrine, while Calvin, who was more tolerant, forbade usury in loans to the needy but allowed an interest rate on commercial loans.

Calvin supported, in a seminal way, the existence of a “calling” for business activity, an idea which was further developed by later Calvinists, and especially Puritans, in the late seventeenth century. These saw wealth as a sign of predestination, and this had implications for how work was (Protestant work ethic) and wealth accumulation were considered. Max Weber argued that the Protestant work ethic fostered early capitalism, a thesis not free of controversy.

Late Scholasticism (fourteenth to seventeenth centuries) – mainly Italian Scholastics (Olivi, Artesanus, Bernardino of Siena, and Antonino of Florence) and the School of Salamanca in Spain (de Soto, Mercado, and Molina, among others) – developed Aquinas' doctrine. Due to a better understanding of economic dynamism, they accept banking and financial activity and advanced in topics such as justice in contracts, fair commerce, private property and its limits, and the role of free market. Most of them considered it legitimate that the lender receives some interest on his loan to compensate for profit foregone (*lucrum cessans*, “ceased profits”) and for the risk of losing the loan (*damnum emergens*, “loss occurring”).

For more than a century, Christianity, and more specifically Christian Ethics, has paid great attention to moral aspects of the market, business enterprises, working conditions in factories, and respect for labor rights. From the last third of the twentieth century, consumerism and ecology have been objects of study and action by churches and Christians.

## Modern Christian Perspectives on Business Ethics

*Capitalism.* Churches and Christian theologians generally accept the free market economy (capitalism), recognizing that the free market system respects human freedom and contributes to human well-being better than other systems such as the planned economy. However, they are commonly reactive to capitalistic forms close to the primitive “laissez-faire” capitalism, where private individuals operate with almost absolute freedom and with no check or control on their abuses of power. A free market economy is accepted when it operates with a sound ethical-legal framework and in a context of social justice.

*Service and profits.* Jesus looks sympathetically at business people, some of whom are protagonists of his parables, and praises those who made good use of the talent received. At the same time, He preaches against greed and categorically warns: “You cannot serve God and mammon (riches)” (Gospel of Luke 16:13). Serving God entails serving people through business. Profits are necessary but only as an instrument to higher ends. Consequently, making profits is legitimate when they are from serving people; they are not acceptable if they have been gained without respecting people’s rights and their well-being.

*Business enterprises.* They are seen as positive elements of a society, related with the generation of jobs, wealth creation, and as a means to make products, services, and income accessible to people. Many Christians oppose extreme individualism and consider business organizations as communities where people can grow by acquiring skills and developing themselves.

*Honesty and integrity.* The Christian tradition on honesty in commerce dates back to the Old Testament, where fraud, bribe, and extortion were firmly forbidden, as were cheating, paying unjust wages, forcing up prices by taking advantage of the ignorance or hardship of others, and abusing of those in need. The Bible is also explicit regarding integrity in honoring promises, observing legitimate contracts, and repairing injustices. Regarding loans, as noted above, a reasonable interest rate in proportion with the risk is

acceptable, while high interest rates are condemned as usury.

At the same time, the Christian tradition encourages integrity in doing business and acting moved by virtues, including justice and truthfulness. Truthfulness entails giving relevant information to those who have a right to receive it; acting transparently in financial reports, product information, and any corporate communication; not bearing false witness; and avoiding calumny and rash judgment.

*Respect for human dignity and human rights.* Christianity is one of the strongest defenders of human dignity. The creation of the human being in the image of God provides, not only to Christians but to the whole Judeo-Christian tradition, a motive for doing so. The Incarnation of the Son of God as a man and the vocation of the human beings to live in communion with God forever give new arguments to be added to philosophical arguments. Consequently, respect for human dignity and the inherent human rights are strongly supported by the Christian faith, as are the promotion of these rights, especially for the vulnerable, and remedial actions when such rights have been violated. This applies to business and corporate behavior especially in places where human rights of employees and consumers are at risk.

*Human work and working conditions.* Any work is seen as something noble. Jesus Himself was a carpenter. Work is also considered as calling or vocation related with the meaning of life and a means for human flourishing and to grow spiritually. Meaningful work is work which makes personal growth possible and is very desirable.

Any work has dignity as human activity, regardless of its economic value, because it comes from the person, who should be respected, as should labor rights, which are part of human rights. A consequence of this view is promoting decent work, which includes, among other aspects, working in healthy and safe conditions, receiving a fair wage, respect for the right of workers to associate through unions, an appropriate participation in business life in different ways, and harmonizing work and family duties as much as possible.

*Ecology, sustainability, and globalization.* Christian thinkers generally defend the position that we should act as stewards of Creation and take care of our “common home” and even have a sense of communion with all beings through considering God’s love for all creatures. This requires safeguarding and caring for the environment, moderation in the consumption of goods, concern for sustainability, and remembering the needs of future generations.

In the context of globalization, the Christian faith has a sense of universal fraternity, since God “from one man has created the whole human race and made them live all over the face of the earth” (Bible, Acts 17:26). Consequently, a global world should make us not only much more interconnected but also reinforce the sense of being brothers and sisters of all humankind.

The safeguarding of the natural environment, social inclusion of all people and groups in prosperity, the eradication of poverty, and contributing to human development are now quite common concerns of Christian communities.

## Collaborations Between Grassroots Advocacy Groups and Business

Kelly R. Eskew

Kelley School of Business, Indiana University,  
Bloomington, IN, USA

## Synonyms

Anti-discrimination; Social impact; Social justice;  
Social movement

## Introduction

Social movement activists often target companies in order to “influence [the] organization’s social practices.”<sup>1</sup> Strategies may include boycotts, shareholder actions, and letter-writing campaigns, all intended to draw visibility to a social cause.<sup>2</sup> Activists may also work to impede profitability and influence corporate stakeholders, including consumers, investors, and regulators.<sup>3</sup> However a lack of shared goals between social movements and business on one issue does not equate to an inability to align on others. Businesses and grassroots activists can and do collaborate, but the factors that lead to successful partnerships are not well-defined.

## Business and Social Movement Collaboration

### How and Why Businesses Collaborate on Social Issues

Business is at the forefront of sustainability efforts as CEOs are making the business case for stronger environmental protection.<sup>4,5</sup> Corporate social responsibility (“CSR”) programs are common and not only make charitable donations through their foundations but also pioneer environmental projects and work to strength communities and schools.<sup>6</sup> Since 2010, 33 states have passed “benefit corporation” legislation, which allows companies to legally protect their social mission as a corporate obligation.<sup>7</sup> Businesses are also

creating their own social movements<sup>8</sup> that mirror the principles shared by grassroots advocates in areas such as poverty eradication and health-care access. Social responsibility has moved from fad to company policy.

Thus, companies can and do collaborate with social movements and actively engage in social causes where there is a perceived risk of outcomes that may threaten the bottom line or are inconsistent with company values. Inherent in such partnerships is the risk of offending stakeholders, as well as of creating an appearance of insincerity or inauthenticity.<sup>9</sup> Thus, business may join with activist groups to “borrow from the superior social legitimacy of these organizations.”<sup>10</sup> It may also do so because reputable activist organizations have considerable expertise in movement politics, expertise that companies lack. Businesses may need partnerships with both social movement activists and governments to address “a mountainous problem.”<sup>11</sup>

For grassroots activists and business, there is no clear road map that shows each how to leverage the other to achieve shared goals. However, the Indiana experience with its Religious Freedom Restoration Act (“RFRA”) suggests some answers.

### The Indiana Example

In 2015, the Indiana General Assembly offered up Senate Bill 101 (the Religious Freedom Restoration Act or “RFRA”)<sup>12</sup>, a law ostensibly intended to protect Hoosiers in their free exercise of religion, but widely viewed as a discriminatory response to the Seventh Circuit Court of Appeals’ ruling in 2014 that struck down the state’s prohibition on same-sex marriage.<sup>13</sup> RFRA raced through the Republican supermajority legislature in Indiana and was quickly made law by then-Governor Mike Pence, a long-time vocal

opponent of gay and lesbian rights<sup>14</sup> and one of the nation's most conservative governors.<sup>15</sup>

Business and grassroots advocacy leaders collaborated to try to defeat RFRA prior to its passage.<sup>16</sup> The message of RFRA was at odds with the state's reputation for "Hoosier hospitality" and its increasing national profile as a convention and sports hub.<sup>17</sup> It also potentially impacted the ability of Indiana-based companies, including Eli Lilly, Cummins, Dow AgroSciences, and others, to recruit top candidates.<sup>18</sup> Gays and lesbians, as well as their allies, expressed concern that the Indiana legislature's perceived hostility toward equal rights threatened the stability of their families.<sup>19</sup>

Major Indiana corporations and the Indy Chamber, which represents small businesses to big corporations, met privately with legislators, testified in public hearings, and warned that RFRA was unpopular at best and dangerous for Indiana at worst.<sup>20</sup> Nonetheless, their months-long efforts and predictions went unheeded: the legislature pushed RFRA through without hesitation and in defiance of the business community.<sup>21</sup>

One year earlier, the Indiana legislature had moved to place a constitutional amendment banning same-sex marriage on the ballot.<sup>22</sup> Freedom Indiana was formed then to coordinate activist efforts, and business was part of that process. A memorandum of understanding, or MOU, established the goals and responsibilities of this business/grassroots partnership during that

fight.<sup>23</sup> It also provided a formal mechanism for financial support of grassroots efforts. A year later, in late February 2015, Freedom Indiana rapidly re-launched to fight RFRA.<sup>24</sup> Other LGBT groups also reactivated their efforts in the state.<sup>25</sup>

After RFRA passed, nine Indiana CEOs penned an op-ed to Governor Pence calling for a "fix."<sup>26</sup> Freedom Indiana messaged that effort to its broad list of committed supporters.<sup>27</sup> Thirty-nine tech industry leaders then released a similar statement condemning Indiana's RFRA legislation.<sup>28</sup> While business interests were impacted by the threatened withdrawal of major conventions, including GenCon and Disciples of Christ, among others, it was the activists that energized and organized movement people to write letters, make phone calls, boycott, and pray.<sup>29</sup>

Pence signed RFRA into law in a closed ceremony that included several of the most virulently antigay activists in the state.<sup>30</sup> The secrecy, combined with the persons present, belied the assertion by Pence and others that RFRA was not intended to allow discrimination against the LGBT community. Immediately, political and business leaders around the country denounced Indiana's new law and threatened to pull investments and employees out of Indiana.<sup>31</sup>

<sup>22</sup> Smith (2014).

The day after RFRA became law, Freedom Indiana hosted a planned anti-RFRA rally that unexpectedly drew thousands of protestors, committed to continuing the fight.<sup>32</sup> The next day, Pence appeared on the Sunday morning television news program *This Week* with George Stephanopoulos and refused to answer questions about the intent of the law.<sup>33</sup> Within days, Pence, under pressure, signed an amendment that not only affirmed the rights of gays and lesbians but also those who face discrimination on the basis of gender identity.<sup>34</sup>

### Lessons for Business and Social Movement Collaboration

Several factors appear to have been key to the success of the business/grassroots collaboration on Indiana's RFRA law. First and perhaps most significantly, there was a business case for opposing RFRA.<sup>35</sup> Firms raised concern that discriminatory laws and attitudes negatively impacted recruitment of talented, thoughtful people to the state.<sup>36</sup> This aligned with the grassroots message that treating one's neighbors, coworkers, friends, and family members differently based on inherent characteristics like race, ethnicity, sexual orientation, and gender identity demeans everyone.

Additionally, the advocacy groups respected the limits of the business case and were careful of "mission creep."<sup>37</sup> They committed to defeating RFRA, and eventually to achieving a

reversal in some meaningful form, and worked with businesses for funding and public support.<sup>38</sup>

Activists may have a more expansive vision of an issue, one that goes beyond the business case. But collaboration in a focused way may be the limit of what the partnership can support, even if the entirety of an agenda for social change cannot be achieved collaboratively. The ability and willingness to focus also demonstrate the professionalism that a social movement group possesses and builds trust. When businesses know that they can hand off the rallying, social media, and 24-h news cycle work to activists who will respect the agreed-upon boundaries of the partnership, then businesses may perceive that they can safely come back for further targeted campaigns.

Waiting for social justice causes and business concerns to sync up may be the limit of the collaborative relationship. But many activist organizations exist in the environmental space, for example, and there is clear opportunity for business in that ambit. Where a nexus between social goals and the business case can be articulated, meaningful legislative and political collaborations between the grassroots and the corporation may be fruitful.

## Collective Bargaining (USA)

James Wallihan

Department of Political Science, Indiana University (IUPUI), Indianapolis, IN, USA

### Synonyms

Labor negotiaton between unions and management

### Definition and Elements of Collective Bargaining

Unions in the United States organize to bring collective strength to employees in their dealings with employers. With the exception of multi-employer associations and the involvement of external interests, the “collective” dimension of *collective bargaining* (CB) arises from the union side of the relationship. Thus, there can be no collective bargaining without organized employees.

CB assumes conflicting interests between workers and employers. It is the relationship between unions and employers in which each party seeks to advance its interests through negotiations that may lead to a *collective bargaining agreement* (CBA), or contract. The subject matter of negotiations is the *terms and conditions of employment*, including wages (or salaries), non-wage benefits (e.g., health insurance and retirement), working conditions, job security, grievance procedures, and the procedures and limits of the relationship itself.

Yet CB is much more than the mere negotiation of contracts. As implied above, its first phase occurs when workers form a union, which then strives to force recognition and enter the second phase – negotiation. The third phase occurs during the term of an agreement, called *contract administration* or, often by unions, *contract enforcement* and *grievance representation*.

## An Overview of Collective Bargaining in the United States

In the colonial era and well into the 1800s, worker organization was informal, even intermittent. Workplaces and job sites were small, rarely employing more than a few dozen journeymen and apprentices supervised by a master. Workers sometimes organized strikes, usually in pursuit of higher pay or in opposition to pay cuts. Whether the strike was won or lost, organization usually lapsed. There were no written agreements.

By mid-century there appeared more permanent *benevolent associations*, union precursors that provided insurance for illness, death benefits, and other assistance to members and their families. These early organizations sometimes evolved into permanent unions that continued to offer insurance benefits to stabilize membership through difficult times.

Workers found little sympathy in the courts. Some held that strikes illegally restrained trade. And beginning in the 1880s, state courts began to advance a doctrine known as *employment at will* which held that in the absence of a contract limiting its rights, an employer can hire and fire as it

pleases, with or without cause, and even for cause “morally wrong.” This common law doctrine is currently maintained in almost all of the 50 states.

Opposition to unions was, and continues to be, maintained on the basis of the supposedly immutable “laws” of free market economics, which, adherents maintain, provide optimum wages. They argue that unions interfere with the efficient operation of markets. From the worker and union perspective, a goal of CB is to curb the effects of market forces on labor.

By the late 1800s, unions were established in major crafts, or trades, and cooperated under the banner of the *American Federation of Labor* (AFL). By the 1920s, many AFL affiliates were taking in skilled workers, while ignoring the less skilled, in many of the growing manufacturing industries, where, despite their minority status, they could exercise bargaining leverage.

Beginning early in the 1900s, a different approach was practiced by the militant *Industrial Workers of the World* (IWW), which sought to unite all workers in “One Big Union,” notably in the mining, railroad, agricultural, and manufacturing sectors. While ultimately unsuccessful, the IWW had a profound influence on later industrial union organizing efforts.

By the early 1930s, worker unrest among less-skilled industrial workers led to widespread protest. By 1935 restive industrial unions were in open rebellion against the AFL and left its ranks the following year, forming what was later named the *Congress of Industrial Organizations* (CIO). In 1955 the two bodies reconciled, merging to form the *AFL-CIO*.

## The National Labor Relations Act (NLRA)

In 1935, Congress addressed economic collapse and the demands of millions of Americans, when it passed, and President Roosevelt signed, the *National Labor Relations Act* (NLRA), also known as the Wagner Act. Though not the first statute enabling collective bargaining, it was the broadest in scope and, after several modifications favoring employers, remains the dominant statute regulating collective bargaining in profit sector

employment. Other statutes govern the railway and airline industries and federal government employees.

The NLRA covered each of the three stages of collective bargaining. First, it established employees' rights to join unions without employer interference or retaliation. The statute created an oversight agency, the *National Labor Relations Board* (NLRB), to accept worker petitions for elections, establish appropriate bargaining units (the categories of employees eligible to vote and be covered by a CBA), and conduct elections. The NLRB would then certify a union that garnered a majority of votes cast as the *exclusive bargaining agent*, with the employer mandated to bargain with that union in good faith. This *duty to bargain* continued through the second, or negotiation, phase and into the third once a contract took effect.

The NLRA declared certain types of employer conduct (e.g., discriminating against or discharging employees for union activity, refusal to bargain in good faith, making unilateral changes in negotiated terms) to be *unfair labor practices* (ULPs) and charged the NLRB with investigating ULP allegations in all three phases of collective bargaining and penalizing employers found to engage in them.

The passage of the NLRA fed the surge of union organizing. Unlike the AFL unions, each of which represented workers in a different skilled trade or craft, CIO affiliates were based on entire industries. Thus, the Steel Workers union sought to represent all bargaining unit employees in the basic steel industry, skilled and less skilled alike. By early 1940s, industrial unions were firmly in place in major mass production industries.

Contracts were negotiated with major employers in each industry. CBAs were committed to writing but, by current standards, brief. The initial contract between the United Auto Workers (UAW) and General Motors consisted of two pages. By the 1970s, bound master agreements, with local (plant by plant) supplements, approached two inches in thickness.

During the 1960s and since, states enacted laws, typically patterned on the NLRA, permitting limited bargaining with state and municipal

governments, although they typically ban strikes and, in several states, negotiation of economic terms such as salaries and benefits.

## Bargaining Power and Bargaining Structure

In the formulation of Charles Craypo (1986), union strength in collective bargaining issues from two sources: the *ability of employers to pay higher compensation*; and where employers have this ability, the *ability of unions to make employers pay more*. The first set, employer ability to pay, exists:

- A. Where employers can pass on higher labor costs, as is ordinarily the case in monopolistic and oligopolistic markets; where markets are spatially sealed, as often occurs in local building construction; in cases where rates are set through regulation; and where cost-plus contracts or other subsidies are in effect.
- B. Where employers can reduce production costs through productivity gains.

The second part of the formulation – union ability to make employers pay – requires:

- A. That unions organize the *relevant work force* (RWF), which consists of all workers whose labor can replace that of unionized workers. For craft workers, the RWF consists of workers capable of doing the skilled work in the particular market. For industrial workers, it covers the work wherever it is performed, as long as the products or services can replace those provided by the union-represented, and potentially striking, workers. Thus, the union must “follow the work” wherever it is performed.
- B. The absence of *competitive unionism*. If more than one union competes to represent employees in the RWF, they may undercut one another on labor costs. This competition can be eliminated by forming a coalition to bargain together as one, by coordinating efforts to achieve common terms, by

- consolidating different bargaining units, and by merging into a single union organization.
- C. Developing an appropriate *bargaining structure*. Union bargaining organization must match up effectively with employer structure. Faced with large employers in large industries, unions must centralize bargaining to build numerical and organizational strength (solidarity) and standardize demands and terms or, where there are separate contracts with each employer, establish a strong pattern in order to standardize terms. To fail here is often to invite employers to “divide and conquer,” playing unions or bargaining units off against one another.

## Types of Bargaining Structures

Bargaining power is more than the result of crafty negotiating technique. Involvement and mobilization of union members before and during negotiations certainly helps, as does timing (e.g., bargaining when inventories are low and demand high). But much of the leverage in complex environments results from bargaining structure, the combinations of bargaining units and levels of union and employer organization for bargaining engaged in a given negotiation or set of related negotiations.

The simplest bargaining structure is a single local union negotiating for a single bargaining unit which is the sole unit employed by an employer. Add to these elements and the structure becomes more complex. There may be more than one bargaining unit in the workplace, with a contract for each. There may be a different union representing each unit. In some instances, several employers negotiate with a single union on a national basis. Or several employers may combine to negotiate with several unions. Building trades unions often negotiate geographical area agreements in which all employers agree to similar terms that maintain the relationship among wage scales for different trades in the area. These structures and contracts may serve both parties by

“taking wages out of competition” and thus stabilizing wages and eliminating the ability of employers to undercut one another.

An example: Once the UAW organized most of the auto plants in the USA during the 1930s and 1940s, the union moved toward corporation-wide CBAs with each of the three major employers: General Motors, Ford, and Chrysler. These agreements covered wages, benefits, and other subjects that could be standardized across the industry. The contract with the first, or “target” employer, became the pattern for the two that followed. The structure, in effect, was industry-wide. Items where local plant flexibility was needed that did not create competition among plants (e.g., different scheduling needs among foundry, parts, and final assembly locations) were addressed in local supplements to the master agreements. Automobile industry agreements had major impacts on wages in other industries.

A different two-level structure appears in industries such as entertainment, where, for example, a master agreement between a union and employers addresses general provisions, including some economic floors and caps, within which individual actors or athletes, each represented by their own agents, negotiate individual contracts covering compensation and other subjects.

## The Decline of Union Bargaining Power

Union organizing successes during and since the 1930s and efforts to build advantageous bargaining structures paid off in stronger CBAs benefiting not only bargaining unit employees but workers in related areas as well. However, after WWII the political climate took an antilabor turn that plays out to the present. In 1947 Congress passed the Taft-Hartley Act, which amended the NLRA with several measures designed to enhance employers’ advantage. The closed shop (where employers can hire only union members) was banned; ULP charges could now be filed by employers against unions; unions were banned from deploying secondary boycotts (“do not

buy” campaigns against employers not directly involved in a dispute); and states were allowed to enact so-called “right to work” laws which prohibited the negotiation of union shop and union security provisions requiring nonmembers to pay the equivalent of union dues. Dubbed “right to work for less” by labor, these state laws enabled “free riders” to avoid paying their share to support union-negotiated gains benefitting everyone in a bargaining unit.

Union membership peaked in the mid-1950s when approximately a third of the workforce was unionized. By 2016 membership had fallen to under 15 million, or about 10% of the workforce. In the 1950s union membership was almost entirely in the private sector. By 2016 government employees accounted for about half of all members.

Periodic changes in the law and in NLRB enforcement stymied many union organizing, bargaining, and contract enforcement efforts. Federalism enabled employers to shift political decisions from the national level to the states, where they were even more effective in advancing their agendas. By 2016, 24 states had enacted “right to work” laws. “Big money” poured into political action, most of it to the antiunion right, especially after the Supreme Court, in its 2010 *Citizens United* decision, removed restraints on wealthy donors and corporations.

The rise and decline of union membership and bargaining strength cannot be explained solely by political and legal developments. Accelerating structural changes in the domestic and global economies eroded union bargaining power in several ways:

- Work became more fragmented. Once large workplaces have shrunk and many jobs are now mobile, even home based, with scattered workers connected to their “workplace” by computer or hired as contractors, not employees. This change has made realization of solidarity more difficult.
- Automation eliminated millions of jobs.
- Domestically, jobs moved to less-unionized regions and union organizing everywhere became more difficult.

- Markets globalized, expanding RWFs, especially in manufacturing, beyond the reach of U.S. unions. These shifts put the wages and benefits of USA workers directly in competition with workers earning as little as one-tenth their incomes. Plant closings and plant flights became everyday events.

The symptoms of decline were seen in new corporate offensives and waves of “concession bargaining.” For example, during the 1980s and 1990s, employers were increasingly successful in negotiating two-tier wage structures that reduced the wages of new hires below those of current workers doing the same work. Major reductions in employer benefit contributions became commonplace, notably in health insurance and retirement plans.

To deal with these problems, many unions sought, with uneven results, to reenergize their organizing programs, yet overall membership losses continue. However, the ease with which many employers escaped to lower standard, non-union locations has led to a shift of priorities by some unions. *Unite Here* (hotel and restaurant employees), *the Service Employees*, and other unions target employers unable to move their operations. These are typically providers of onsite or local services, not manufactured products.

There have been a few victories. Most, like the Occupational Health and Safety Act of 1970 and the Family Medical Leave Act of 1993, benefit most workers, which benefits those in unions, who are better able to take advantage of these laws. The benefits of bargaining persist for many. And the pay differential between union and comparable nonunion employment, by some estimates, approaches 20 %, but with the floor for many non-union employees higher as a result of union bargaining efforts.

## Collective Bargaining Around the Globe

CB is regulated by statute in most democracies. Some arrangements are relatively original. Germany, for example, maintains its system of *code-termination* which, in an effort to democratize the

economy and the society, mandates worker participation in the governance of large corporations. Laws in many countries are derivative, based largely on statutes found elsewhere. Authoritarian states that do not ban unions and CB still tend to be formalistic, with the government and large employers, regardless of statutory provisions, exercising a dominant hand. Here, the law often exists for the sake of appearances and does not significantly affect behavior.

### Issues of Justice, Fairness, Equity, and Ethics

The ratios among different pay classifications within a bargaining unit or industry are complex. Overall, CB appears to narrow the pay gap between skilled and less-skilled workers, but maintains a level for both that is higher than the “free market” would provide. This compression effect is worked out politically within the union, where skilled trades employees are typically a numerical minority though accorded an economic premium, and with employers through negotiations.

Attention in recent years has focused on the income and wealth differentials of different classes. A 2014 Harvard Business School study showed CEOs in the 500 top USA corporations making 354 times the pay of the average worker, more than double the ration in runner-up Switzerland. Extreme inequality is also reflected in the data on wealth: the top one-tenth of the top 1% hold more wealth than does the bottom 90%. How much these disparities have been affected by CB and its decline is not firmly established.

Another issue concerns union democracy. Optimal bargaining structure, to the extent it requires centralization, tends to centralize authority within unions. To maximize solidarity and be effective, unions simply cannot allow members of each local union to realize their own preferences regarding economic terms. To do so would place them in competition with one another, ripe for defeat. The sheer complexity of many negotiations would also appear to add to centralization

and limit democracy, affording greater weight to both expertise and solidarity.

The third phase of CB, grievance representation and the possibility of third party arbitration where a case cannot be settled between the parties, raises other issues of fairness and justice. A weak union typically has less power to achieve justice and fairness for aggrieved workers. As union people often observe, “The contract is only as strong as it is enforced in the grievance procedure.”

Even a strong union may be susceptible to uneven representation. The NLRA imposes on unions a *duty of fair representation* which prohibits arbitrary, discriminatory, or bad faith representation of employees in the bargaining unit. But this does not redress all disparities, such as those flowing from internal union politics, nor does it account for disparities of bargaining power within and across units. The opportunity to raise grievances is certainly a major advantage for union workers over the non-union *status quo*, but it is not a cure-all.

These are only a few of the issues that arise and that may frame matters of ethical conduct for members and unions alike. Yet they do not touch employer responsibility for normative matters in employment and the workplace – matters over which managements have day-to-day initiative and control. These include outcomes flowing from employer power in collectively bargained arrangements. The expansion of corporate power, not just in the workplace but in politics and society, raises questions, at least in the USA, about the reality behind declarations by the International Labor Organisation (ILO) and the NLRA suggesting that worker and union rights are human rights.

## Commodification of Care

Joan Marques and Mercedes Coffman  
Woodbury University, Burbank, CA, USA

### Synonyms

Big Pharma; Corporate greed; Health; Immorality; Medical industry

### Introduction

This article considers the trend of powerful entities that are in full control of the means and knowledge needed to provide care and assistance to those who need it most. The article specifically focuses on healthcare, since the healthcare industry could be considered the strongest and most solid manifestation of care commodification. Scholars on the topic of healthcare and the ethics surrounding this important aspect in our lives have questioned whether healthcare could be considered a commodity as any other. More importantly, the question was raised, whether free-market ethic could work for healthcare. An often cited perspective since the early questioning has been that healthcare is not a commodity as any other because, (1) healthcare happens in a physician-patient relationship, which clearly differs from the usual definition of a commodity as being a transaction without relationship between seller and buyer aside from the transaction, and (2) physicians don't own the product they "sell," which is usually the case with a commodity (Pellegrino 1999). It should therefore first and foremost be understood and respected that patients are the primary stakeholders in a healthcare situation, and excellence in their care is the primary value creating activity (Reddy and Mythri 2016). "Healthcare is a common and public good which has to be preserved equally by the healthcare organization and also the welfare state" (Reddy and Mythri 2016, p. 374).

### Big Pharma: A Healthcare Powerhouse

In the healthcare industry, there is an elite group of major corporations holding patents and rights to the production of products and treatments, needed by large groups of society members, and using this privilege to accumulate billions of dollars at the expense of societal health. In an analysis of the pharmaceutical industry, Oppenheimer et al. (2015) lament about the immense sums of money that are invested in items aimed at enhancing health and well-being of society's members. Due to their critical position, pharmaceutical companies (often referred to as "Big Pharma"), indeed, often find themselves entangled in litigations due to a variety of perceived contradictions in their operations. For instance, they claim that there is currently an innovation crisis in the healthcare industry, yet the number of new medications soars. They also claim that they have to pay high costs (more than \$1 billion) to get a new drug into the market, yet the spending of their revenue on R&D is estimated to be merely 1.35 percent of their revenue. In addition, Big Pharma's research is publicly funded, with the government being the most important consumer of their product (Oppenheimer et al. 2015). D'Agostino (2012) adds to the above concerns the fact that the pharmaceutical industry is patenting essential medicines, which is perceived as unethical and socially irresponsible. The question thereby raised is, whether it is acceptable to view medicines as a luxury. Orozco and Poonamallee (2014) underscore the bleakness of it all by pointing out the one-sided notion of Intellectual Property Rights (IPRs), which favors established corporations in healthcare at the expense of the appropriation and commercialization of indigenous knowledge. At the same time, the general interpretation of IPR blatantly disregards the knowledge of indigenous peoples regarding medicinal products in nature and their rights to knowledge protection.

The actions of Big Pharma reek like corporate greed, which is particularly disheartening when we consider that the product of this global player is healthcare: the foundation for the living to enjoy a healthy life. Brown et al. (2012) point out that the global health industry leader, which strikes up

around \$700 billion annually, is known for its widespread unethical sales tactics and marketing strategies including blatant exploitation, as mentioned earlier in discussing the IPR, as well as abusing and manipulating those in poor parts of the world. Big Pharma is also known for its unabashed astroturfing, which is the practice of masking the sponsors of a message or organization to make it appear as if it originates from and is supported by an individual. This is where we see people suffering from serious illnesses such as cancer appearing on the media to fulfill the wealthy companies' commercial desires. Brown et al. also reiterate the tendency of these gigantic healthcare providers to claim high R&D expenses, while their marketing budget far exceeds their investments in new product development. One of the most abysmal recent strategies is to lower the official hypertension threshold, under the guise of ensuring improved health among society members, but with the real aim of vastly increasing their customer base and the market for ACE inhibitors, hence, their annual income. Then there are these suave sales representatives, who regularly visit the physicians, and offer them the most eye-popping gifts to convert them into easy followers of Big Pharma's demands to prescribe so-called new drugs to questionable medical conditions (Brown et al. 2012).

### Health Insurance as Commodity

When considering the aspect of health insurance, the concerning trend gets further congealed. The World Health Organization (WHO) announced that, in 2016, private insurance accounted for more than 40% of all health expenditures in the USA, while out of pocket expenditures added up to an additional 11.5% (Christiansen 2017). The excessive rates for health insurance from private companies, as is the common trend in the USA, continues to lead to large numbers of uninsured or underinsured members of society. As a result, the USA has a reputation of having inferior health outcomes, even though general spending on healthcare is higher (Christiansen 2017). The devastating truth is that many people in the USA fear to acquire healthcare and suffer from conditions

that go untreated, due to the commodification of care in this country. It is, then, not surprising when comparative studies find that larger parts of US citizens (almost 40%) avoid the doctor in case of a medical condition, compared to much lower percentages in countries with government healthcare, such as Norway and Canada (7 percent), Sweden (5%), and the UK (1%) (Davis et al. 2014). Sadly, researchers have also found that those who can afford health insurance run the risk of being over-medicated, over tested, and treated, because the service to them is perceived and treated as "sales" to support the profits of Big Pharma (Applbaum 2009; Gottschalk 2009; Leys 2009).

### Perspectives on Physicians

When we consider the effects of healthcare commodification on relationships with physicians, another concerning reality surfaces. Chih-Han Huang et al. (2018) used cross-national data of 23 countries to study the role of healthcare commodification patient-physician trust. The study demonstrated that people living in healthcare-commodified countries, such as the USA, Germany, and Poland, have significantly lower levels of trust in their physicians than people living in reference countries, such as Denmark, Switzerland, Belgium, and France and those in healthcare-decommodified countries such as the UK, the Netherlands, Japan, and Norway. Based on their analysis of these three categories of countries, Chi-Han Huang et al. conclude that healthcare commodification significantly contributes to the decline of public trust in physicians. "When healthcare is profit driven it becomes about maximizing profit rather than about improving health" (Phipps 2016, p. 266). Additionally, physicians have frequently been proven receptive to the freebies and honors they receive from the pharmaceutical giants, which then influence their decisions in the prescriptions of treatments to their patients (Reddy and Mythri 2016). Commodifying healthcare remains a major concern in light of the Alma-Ata declaration of 1978 which stated that health is a universal human right and that the gross inequalities in health between and within countries are unacceptable (Phipps 2016).

## Healthcare Commodification in Practice

In the final section of this article, two cases are reviewed, each pertaining to the commodification of healthcare products. In each of these cases, a business executive abused a healthcare product that is immensely important to sustain the well-being of large groups in society, for excessive wealth accumulation, thus illustrating the point made in this article, that healthcare commodification is simply unethical.

### Mylan's EpiPen Price Gouging

EpiPen is a pen-shaped, self-injectable medication, prescribed to people with life-threatening allergies. Because EpiPens can be lifesaving in cases of extreme allergic reactions that can cause swelling in airways leading to unconsciousness or even death, about 3.6 million Americans are dependent on this drug and carry it with them at all times (Ossola 2016). EpiPens are so important, because they contain epinephrine, also referred to as adrenaline, which causes muscle relaxation, reopening of airways, and a chance to breathe again, all within 30 s after injecting it in a thigh of the allergic person. Since this medication wears off in 10–20 min, it is critical for the allergic person to get help within that time for more structural treatment. While there are somewhat similar remedies, they do not have the same effect as EpiPen, so doctors usually don't prescribe the alternatives. A recent effort to get a true generic alternative into the market was rejected by the Food and Drug Administration (FDA) (Ossola 2016).

Since 2007, the price for a two-pack of EpiPens, as they are sold, has increased by more than 500 percent, from about \$100 to more than \$600. This has placed an enormous pressure on patients with high health insurance deductibles. The company that markets the EpiPen is Mylan, and its CEO is Heather Bresch, a woman who has been ranked in Fortune's Top 50 for most powerful women in business, and whose father is the senior US Senator from West Virginia. The EpiPens must have been a true cash cow for Mylan's executives, as their salaries took an immense hike along with the price increase of

the medication. Bresch saw her annual salary increase almost seven-and-a-half times since 2007, from \$2.5 million to \$18.9 million (Ossola 2016).

In regard to the EpiPen price gouging accusations, Mrs. Bresch claimed that the price increase was needed to compensate for the immense marketing and lobbying campaigns that the company set up for the EpiPens. As the company came under increased media scrutiny, it started offering vouchers to reduce the price of the medication for those who have to pay it out of their own pocket. However, this resulted in yet another wave of criticism, as vouchers are not a price reduction. While Mylan has thus far refused to drop the price of the EpiPens, the company saw its stocks plummeting and got pressured into either giving in to the demand for a drastic price reduction or finding creative alternatives to regain some of the public's trust (Ossola 2016).

Sources reported that Mylan's top executives cashed in about \$300 million in compensation between 2011 and 2016 (Turtle 2016). What makes it all more questionable is that Bresch is not just another CEO. As mentioned before, her father is a US senator and her mother a powerful executive in the national school board group, who headed a campaign to require EpiPens in schools (Turtle 2016). Yet, as accusations piled up, Bresch did exactly what most business executives who get caught in the act of greed do: they point the finger elsewhere. In Bresch's case, she conveniently blamed it all on Obamacare, calling it a "broken system that needed to be fixed." Her father, senator Joe Manchin, also took the easy way out by denying any knowledge of his daughter's activities, claiming that he had little or no understanding of her industry practices (Turtle).

Meanwhile, Mylan has introduced a generic version of EpiPen for half the price into the market, causing the company's market performance to be corrected, with a stock price spiking due to reported adjusted earnings per share of \$1.57, instead of the estimated \$1.42 (Mangan 2017).

### Martin Shkreli's Pharmaceutical Dealings

Martin Shkreli made a name for himself as an American entrepreneur and a pharmaceutical

executive and subsequently as a price gouger and securities fraudster. He had earned some early successes in predicting biotech stock at Cramer, Berkowitz and Company and Regeneron Pharmaceuticals in the early 2000s, then worked at UBS and Intrepid Capital Management prior to co-founding a hedge fund called MSMB Capital Management in 2009 (Goldman 2015).

In 2011, Shkreli expanded his horizons and founded the pharmaceutical company Retrophin, which he managed as a portfolio company focusing on biotechnology, to create treatments for rare diseases. Right after doing so, Shkreli made some poor bets, causing him to lose \$7 million for his hedge fund and an additional \$1 million in other trading losses. Having reached an all-time low in assets, MSMB discontinued its trading. However, Shkreli continued to communicate with investors as if all was still flourishing at MSMB. He convinced nine investors to place \$3 million with him and mismanaged it to a point where he had a little over \$300 left. He had a habit of paying himself lavishly, merrily ignoring the agreed upon 1% management fee and 20% profit incentive (Smythe 2015).

As with most Ponzi-like swindlers, Shkreli started robbing Peter to pay Paul: for the next 3 years, he took money from Retrophin to pay for his personal debts and those of MSMB (Goldman 2015). He falsified documents to make it appear as if MSMB had invested in Retrophin. Investors at Retrophin started becoming concerned and demanded money from Shkreli. As Shkreli continued his unapproved settlements, disguised as (fake) consulting agreements, the members of the Retrophin board became so disconcerted that they voted him out as CEO in 2014 (Goldman). Shortly before he was ousted from Retrophin, the company acquired the rights to market Thiola, a drug used to treat the disease cystinuria, and raised the price of this medicine from \$1.50 to \$30 per pill, a 2000% price increase for a pill of which oftentimes 10–15 had to be taken per day by one patient.

Within a year, and undaunted by his previous experiences, Shkreli started another pharmaceutical company, Turing Pharmaceuticals. Turing bought the rights to market Daraprim, a popular and highly demanded medical treatment for AIDS

patients. As he got sued by Retrophin for \$65 million for using the company's money to pay of MSMB investors, Shkreli unscrupulously gouged the price of Daraprim by raising the price per pill from \$13.00 to \$750.00, a raise of 5,000% (Goldman 2015), claiming that he did what his investors wanted: profit maximization. Shkreli soon acquired the reputation of being the most hated man in America, not necessarily because of the size of his securities fraud, but far more because he engaged in such distasteful price gouging with products that were meant to assist sick people. At the end of that year, Shkreli was arrested by the FBI and accused of running a Ponzi-like scheme. He resigned as CEO of Turing and was replaced by the Chairman of the Company's board, Ron Tilles.

The recurring act of price gouging on medicines, as presented in the above discussed cases, has revived the discussion about capitalism and human well-being. "When allowing pharmaceutical companies to arbitrarily decide prices, especially for those medications that do not simply relieve symptoms but rather sustain life, many believe that dangerous territory is entered: 'The more definitive the cure, the closer we are to asking, 'What's the value of a human life?'" (Martin Shkreli and the Increased Cost. . . 2015).

## Common Good Principle

Usочи Joanann Ilozumba

Instituto Empresa y Humanismo, Universidad de Navarra, Pamplona, Spain

## Synonyms

Common good – common end/shared end; Community – society/organization/association; Flourishing – well-being/fulfillment; Good – end; Virtues – excellence

## Introduction

According to the Pontifical Council for Justice and Peace (hereafter, CSDC) definition of the common good which departs from the premise of the “dignity, unity and equality of all people,” the common good is “the sum total of social conditions which allow people, either as groups or as individuals, to reach their fulfillment more fully and more easily” (CSDC 2004, 164). But what is the good? It is an end which attracts and perfects the one who pursues it. And what makes this good “common” is that it can be achieved if, and only if, everyone else in the group achieves it. In other words, it belongs to everyone and to each person. Only in this way is it possible to attain the [common] good (CSDC 164). For this reason, the common good perfects the persons involved as they jointly seek excellence in their actions to preserve the uniting factor on which their flourishing depends. Indeed, the common good transcends physical objects that meet individual desires as if they were the only cause of human association (Simon 1960). It is not a clutter of material goods; neither is it a sum of individual self-interests. It is an internal guiding principle and the end of a community of persons acting for the whole (Sison and Fontrodona 2012). Therefore, the common good is “the good of all people and of the whole people” (CSDC 165).

Certainly, there have been debates about whether general usage goods fulfill the criterion

of being termed common goods. Some authors like John Rawls choose to equate the collection of social amenities and individual rights to a conjunct possession of goods, in the sense that the common good is a quantifiable assemblage of satisfied self-interests. Other authors (Walshe 2006) pose the notion of the common good as an undeterminable, albeit a real feature of a specific community, whereby the members, guided by a common objective, strive toward building a society that facilitates their flourishing. To this end, this essay reiterates that the common good is not a mere aggregate of individual goods, nor is it exclusive of these personal goods. A mere sum of individual interests does not guarantee a community of shared end. Although made up of parts, the common good is an integral whole that is undiminished despite being shared by many.

This paper presents a concise knowledge of the main underpinnings of the common good principle. However, it does not pretend to offer a comprehensive presentation of the topic but rather a precise insight into the critical notions of the common good. To do this, it first explores the historical background of the common good principle beginning from the Greeks. Second, it enquires about the core precept behind the common good – virtues – and their role in perfecting the human person to attain flourishing. In the last section, it examines the different manifestations of the common good in human society, primarily, in the political community where there are natural communities and voluntary associations.

## The Different Conceptions of Common Good in History

The notion of common good has been present, albeit sometimes implicitly, since the Greeks. In the *Republic*, Plato dramatically contends a king's importance in a State that secures unity, not division or discord. Such good does not belong to the State's individual exclusively but to the entirety (The Republic 2003, 462a-e). Therefore, each citizen rises above the use of singular pronouns of "mine" to utter in unison "ours." The above shows a separation between unity and

individuality in the conception of the common good. Aristotle in *The Nicomachean Ethics* (hereafter referred to as NE) stressed that the common good is possible only when grasped from the perspective of individuals' common goals in a society. And when the common good principle reigns in that community, he believed that the shared good among these individuals is of higher value than their individual goods, thus preserving what is more significant and dearer to a greater number of people. Also, even though the common good is superior, it is not opposed to individual goods (NE 1094b). It is at once communal and individual (Dupré 1993).

Thomas Aquinas's notion of the common good in medieval times explores various interpretations. First is the idea that "common" signifies a universal whole; that is, it "can be said of many and is understood to be entirely in each of them" (Walshe 2006, 199). Thus, a common good belongs to all the community members precisely because it is contained or sought by each member. In another interpretation, Aquinas equated the common good to something that is yet to exist or actualized as the end goal of each individual who makes up a community (Walshe 2006, 200). In other words, the common good is not yet present. It acts as a propelling force that determines the actions of each of the community members. Finally, the most critical account of Aquinas' common good is that of an integral whole. Here, the good can only be common insofar as each community member possesses it (Walshe 2006, 205–208). Moreover, apart from material goods, individuals also share goods that appeal to rationality and represent human flourishing, such as truth, love and contemplation of the arts, friendship and companionship, the quest for social justice, and so forth.

With liberal enlightenment, there is a substantial loss of the notion of the common good due to their adherence to individualistic conception of the human person. For these thinkers, the human person is primarily an individual who only takes up social relations as an afterthought. Secondly, their interpretation of the good equates to individual rights. However, rights are adversarial. They cannot be shared. Hence, individuals seek their

flourishing depending on what they take as their good/right. The good, then, simply means what each individual prefers. Therefore, as liberal enlightenment draws on individual rights as the good, it is incompatible with the notion of common good. And this explains why some modern and contemporary authors understand the common good as an aggregate of individual goods. But, again, the common good is an end, it perfects, and it is shared.

### **The Driving Force Behind Common Good: The Virtues**

The virtues, as Sison et al. (2018) summarized, “are necessary for and partially constitutive of flourishing.” “Virtue” comes from the Latin word *virtus*, which originates from *vis*, meaning “force,” “power,” or “strength.” *Virtus* is the translation of a Greek concept, *arête*, which stands for “what is best” or “excellence” in human beings. “Virtue,” therefore, means “what is best in human beings” or “human excellence” (Sison et al. 2018). And so, a virtuous character results from the development of virtuous habits. Habits derive from the frequent repetition of virtuous actions caused by ethical inclinations consistent with human nature and its end (Moosmayer et al. 2020).

As earlier noted, the common good is well-being or flourishing. Virtues, on the other hand, are partially constitutive of the common good. They are *constitutive* because there is no flourishing without the virtues. Flourishing takes place to the extent there is excellence in the person’s nature, the acquisition of upright habits through continuous striving to do and act well. That is no more than the perfection of one’s character through the practice of virtues. Indeed, as a human being’s individual and social dimensions are interconnected, people cannot flourish without being part of society. No person can thrive without other people achieving a certain level of well-being too. Thus, the common good comes about as a collective effort of a society’s members to contribute to well-being through “doing well.” Every member needs to contribute his part to

promote the common good by striving to act in a rational way consistent with the good. Each member ought to seek the common good as a personal effort that contributes to building up the State, which involves “living well and doing well” (Aristotle 1987, 1098a).

In addition, virtues are *partial* components of the common good because there is need for the economic means. Hence, it is clear that flourishing/common good (which is the object of politics) depends on two pillars – the virtues, which are products of ethics, and the material goods, which are products of the economy.

### **Different Manifestations of the Common Good**

Primarily, the political community provides the architectonic structure for human flourishing. Here, there are the natural communities comprised of the family and the village. Humans belong to them by nature. Each of these groups has their own common good; otherwise there would not be any uniting end that they share. The family’s common good is reproduction and the quest for daily survival. But it remains too limited an organization to provide flourishing. On a broader scale and while still within the natural community, there is the village which goes beyond the quest for daily necessities. In the village, different families support one another to make up for what they cannot provide individually by themselves. Again, the village does not guarantee full flourishing. Both the family and the village need the entire political community to provide flourishing.

Between the political community and the individuals in their families, there are the intermediate associations. They are voluntary associations that one belongs to because one wants to. These are schools, churches, social clubs, business firms, and other economic organizations. Each of these groups fulfills a specific need and has their peculiar common good. However, the principles of subsidiarity and solidarity should accompany their common good. “Subsidiarity respects personal dignity by recognizing in the person a

subject who is always capable of giving something to others” (Benedict XVI 2009, 57). Thus, there is reverence for freedom of initiative to establish private institutions or engage in activities that contribute to society’s flourishing without fear of being overshadowed by the State. Along with subsidiarity comes the principle of solidarity, which is not a mere sentimental feeling at other’s tragedy. Instead, it is the firm resolve to seek the good that all members hold dear and possess in common. Certainly, solidarity guarantees a united striving for a shared end, a prerequisite of the common good.

Business firms as economic intermediate associations have the common good as collaborative work. Work presupposes the whole dimension of the human person. Thanks to our social nature, certain types of work are impossible without the cooperation of the others. Working together for a particular enterprise provides the foundation of a shared end and the transformation of both the objective and subjective dimensions of work. The objective dimension is external to the agents and made up of resources and instruments used. The subjective dimension is “the human person’s activity as a dynamic being capable of performing a variety of actions” (CSDC 270). For this paper, the primacy of the subjective over the objective is affirmed because it is here that humans acquire knowledge, skills, and the cultivation of virtues. Developing the virtues at work perfects the agents and transforms him into a virtuous person. Indeed, businesses start with the aim of high profits. However, in an ethically guided firm, a high profit margin need not be its exclusive end. Instead, a business is successful only in the measure that there is flourishing of all the members. In other words, the firm thrives by a genuine principle of the common good.

The above can be extended to the professions. But the question is: what is a profession? A profession is an occupation whose core element is work based upon the command of a specific branch of knowledge and skills used in the service of others. Its members form a college of professionals that is governed by codes of ethics. They profess a commitment to competence, integrity and morality, altruism, and the promotion of the

public good within their domain. These commitments form the basis of a social contract between a profession and society, which in return grants the profession a monopoly over the use of its knowledge, the right to considerable autonomy in practice, and the privilege of self-regulation. Professions and their members are therefore accountable to those served and to society (Cruess et al. 2004). For example, lawyers are agents of the law; thus, a lawyer who takes bribe to win a lawsuit is a corrupt lawyer. The same goes to a physician whose primary aim is to save life and seek health. A physician who is paid to take life in whatever way is a bad physician. Ultimately, the professions as intermediate associations of a political community have their own common good, and each professional has a committed task to uphold the common good through his work. Also, because virtues are one of the indispensable means to flourishing, the virtuous professional contributes to the common good of his organization and to the entire political community through his work well done.

## Conclusion

The essay has presented a comprehensive definition of the common good derived from CST. The definition departed from acknowledging the equal dignity of persons and confirmed the common good as achievable only through a collaboration of these persons united by a common end. Everyone seeks to flourish, and a community guided by the common good principle guarantees its members’ flourishing. Then, the paper traced the historical presence of the common good notion and how it evolved from Plato to Aristotle and to the medieval times down to our contemporary era. Later, it delineated the indispensable role of virtues in human flourishing. With its transformative quality, the virtues as attractive goods motivate the agent to live well and flourish, and flourishing is a common good. Finally, it explored the significant groups that comprised the political community and highlighted how the common good manifests in them. The common good of the firm and the other professions accentuated the lead role of virtues for flourishing through work. Hence,

with grounding in virtues, together with the necessary economic and social conditions, the common good is the whole community's flourishing and that of its individual members.

## Communism Versus Capitalism

Thomas F. Phillips  
Trent University, Peterborough, ON, Canada

## Synonyms

For capitalism: Free market, Free enterprise; For communism: Collectivism

“Capitalism can be described, in simple terms, as *a social system of production and distribution, dominated by markets* (markets being where buyers and sellers meet to trade goods and services).” (See [“Capitalism”](#), in this volume). Communism can be described as *a social system of production and distribution, dominated by command* (command being where the details of production and distribution are determined by the state). Communist economies are associated with the central government, long-term planning of production and distribution; capitalism is associated with production and distribution adapting to market pressures that lead to socially beneficial results. While capitalist economies have aspects of command (i.e., the judiciary, national defense, and other roles of the state) that control some aspects of production and distribution, markets play the dominant role. Similarly, communist economies often have some markets; however, command plays the dominant role in production and distribution. China and Cuba, considered communist economies, have allowed markets to exist on a selective basis in the early, twenty-first century – i.e., markets exist but are not pervasive.

## Origins

Capitalism evolved out of post-feudal society where the dominant role of landlords was displaced by capitalists. Unlike communism, capitalism is not associated with an organized political movement. Capitalism emerged over more than a century during which people acquired greater freedom (including control of their own labor) moving from a society dominated by command and/or tradition to one where markets gradually became more common. Early capitalism can be, generally, characterized by a class struggle between feudal landlords and merchant capitalists through which the capitalists emerged triumphant. It is, in theory, associated with “The establishment of perfect justice, of perfect liberty, and of perfect equality. . .” (Smith, Book IV, CH. IX, p. 190).

Communism emerged out of early capitalism where the social conflict shifted from landlords and capitalists to the class struggle between capitalists (employers of labor) and labor (the working class). As recognized by Adam Smith (1776) and Karl Marx (1867), labor adds value in capitalist production – capitalists need labor to be successful and labor, to meet their material needs, require capitalists willing to buy their labor. The capitalists who best captured a share of this labor-generated value (rather than paying wages that reflected labors’ full contribution to production) enjoy the greatest profits. The profit-maximizing imperative of capitalists is directly related to the productive capacity of labor, and the unequal power in the market for labor – employer over employee – is a source of profit for capitalists. Thus, the class struggle between capitalists (the owners of the means of production and the output from production) and labor led, in the mid-nineteenth-century Europe, to the communist political movement.

In the early nineteenth century, the term “communism” was first used in France to define a political movement that addressed the dominance of capitalists over laborers. In 1848, Karl Marx and Friedrich Engels published *The Communist Manifesto* which established the idealistic principles of a communist economy – classlessness, the collective (public) ownership of property and the

means of production, and the distribution of goods and services produced in the hands of the state. This represented a political movement that placed the poor, working-class majority against the wealthy, capitalist minority. While the communist political movement spread, often alongside the spread of capitalism, worldwide in the late nineteenth and early twentieth centuries, it was not until the October 1917 revolution in Russia that a communist government took power. This set the stage for the emergence of more communist economies through political revolution – e.g., in China and Cuba.

## Tensions and Transitions

In social systems of production and distribution, there are inevitable tensions between private interests and public interests. Whether it be capitalism or communism, resolving these tensions reflects social values and the accepted moral and ethical behavior regarding production and distribution. In capitalism, private interests most often take precedent over public interests. There are, however, occasions in capitalism when the public interests (e.g., protecting public safety or promoting behavior that impinges on a generally accepted social value) supersede the private interests through the manifestation of social values as expressed in the political and legal systems. In effect, the expression of private interests in economic activity is accepted until a certain burden of proof is reached regarding their impingement on public interests, according to the social values of the time. Should the expression of private interests prove to be against the public interests, the public interests often prevail.

In communism, the public interests vastly dominate the private interests. In theory, with property being common (i.e., publicly, not privately, owned), there being no classes (thus no capitalists), and the decisions regarding production and distribution being made by the state (i.e., in the collective, public, interests), individual gain is superseded by the public interests. Like capitalism, the social values reflected in moral and ethical behavior are manifest in the political and legal

systems of communism. However, should it be determined that some economic activities undertaken by way of markets where private interests are expressed serve the collective, public interest, communist economies have, on a very selective basis, allowed markets to operate.

The evolution of capitalism over the twentieth century demonstrated greater flexibility than the nineteenth-century views of Marx and Engels, for instance, imagined. In the post-WWII era, in several sectors of capitalist economies, the public interests in health, education, and transportation prevailed over the individualistic, private interests in many capitalist economies. An expanding view of public safety and public health in capitalist economies has also led to restrictions on private actions that can have potentially harmful social consequences – e.g., smoking in public settings, drinking and driving, and environmental destruction. In many ways, capitalism has moderated its individualistic focus to take greater account of public interests.

Those economies that continue to function under communist principles have made a moderate transition toward capitalism. China has designated “special economic zones” where markets operate more freely than in other areas of the country, and capitalist principles are, in certain sectors, embraced. Also, in the early twenty-first century, Cuba has become increasingly open to expanding, very selective, market-based economic activity. Nevertheless, communist economies continue to be dominated by command, not markets.

While capitalist and communist economies remain extremely different – with very different social values reflected in their cultural, political, and legal systems – the differences between capitalist economies and communist economies in the early, twenty-first century are less prominent than they were in the mid-twentieth century.

## Company Socialization and Ethical Fit

David Coldwell  
School of Economic and Business Sciences,  
University of the Witwatersrand,  
Johannesburg, South Africa

## Synonyms

Company-employee value integration

## Introduction

Before joining a new employer, many people have preconceived ideas of what the organization stands for in terms of values, mission, and ethical orientation. On progressing through the application, selection, and induction processes and increasingly embedded in the organization's structure and function, they become exposed to the existential reality behind the overt image. As they are exposed to this reality in the company socialization process overtime, the perceived ethical fit/misfit to their new employer becomes shaped and crystallized. This is regarded as a dynamic process over an unspecified period of time, although the organizational socialization shaping process and the employee's awareness

of ethical misfit that emerges from this is likely to show itself earlier rather than later in the employee's company career, it does sometimes occur later when he or she is confronted by action or behavior incompatible with his or her ethical values. This may or may not lead to prescriptive remedial steps being taken by an employee to relieve ethical incompatibility culminating in various forms of organizational "disengagement" that can reduce individual performance and productivity, or result in labor turnover.

### Organizational Socialization and Staff Induction

Organizational socialization is an important concept in Human Resource Management (HRM) (Antonacopoulou and Güttel 2010; Cable and Parsons 2001; Tuttle 2002), and management research (Ostroff and Kozlowski 1992). Louis (1980, pp. 229–230) defines it as:

the process by which an individual comes to appreciate the values, abilities, expected behaviors, and social knowledge essential for assuming an organizational role and for participating as an organizational member." Staff induction, on the other hand, is defined as "any arrangement made to familiarize the new employee with the organization, safety rules, general conditions of employment, and the work of the section or department in which they are employed. (Skeats 1991, p. 16)

Organizational socialization and staff induction are closely allied concepts, with one distinguishing feature being the timeline of induction, which is usually constituted in the form of a formal program presented over a finite time period, and the on-going process of the organizational socialization over the entire period of employment.

The process of organizational socialization can be regarded as consisting of two main aspects: presocialization and postsocialization. Presocialization refers to features of the company that attracted potential recruits as a place for employment, with its values and ethical stature as part of those features, alongside pay and conditions of service that many employees consider important today. Broadly speaking, presocialization refers to what the recruit expects from a company when joining it. Postsocialization

refers to postenrolment processes of company socialization occurring from the 1st day of employment and the reality of being employed in the company as it unfolds over time (Van Vianen and De Pater 2012, p. 144). Staff induction is often the first formal indoctrination process in company socialization. However, the longer timeline in organizational socialization is recognized by Ostroff and Kozlowski (1992, p. 869): "...when socialization is viewed from a long-term perspective, the contextual features of the organizational environment may become critical and play a greater role after newcomers have achieved task and role mastery." They indicate clearly that *contextual features* of the organization (including, presumably, contextual aspects of company ethicality) unfold and become more pertinent after the incumbent attains technical competency in the work itself.

### Organizational Socialization and Person-Organization Fit

Staff induction and organizational socialization are sometimes used for achieving "goodness of fit" between specific organizations and the staff employed by them (Antonacopoulou and Güttel 2010). Chatman (1991) defines person-organization fit as the extent of the match between organizational and individual values. Chatman (1991) found that value congruence between the new employee and the organization was important, and that the induction and organizational socialization process over the 1st year of employment could fundamentally change (positively or negatively) the person-organization fit relationship. It is also possible, as Cable and Parsons (2001) indicate, that the socialization tactics used by an organization can change individual values to make them more in line with those of the organization.

However, Kim et al. (2005) note that new employees cannot be regarded as perfectly malleable. New employees arrive with their own value systems and the organizational socialization processes may influence their perceptions of this process positively or negatively.

In sum, studies on person-organization fit have suggested four main things:

- New employees have preconceived ideas about the values of the organization and its goodness of fit with their own.
- Value congruence is important in determining individual work outcomes (e.g., job satisfaction, organizational commitment, and turnover).
- Socialization is a two-way process in which the organization can try to mold the individual which he/she can accept or reject.
- There is an underlying dynamic in the socialization process which starts with the new employee joining the company and unfolds over time.

### Levels of Ethical Development and Person-Organization Fit

Kohlberg (1981) provides a theory of moral development that describes three major stages in moral development.

- The preconventional stage which describes a basic level of moral development such as that found very young children and emphasizes obedience enforced by punishment. Later, in the preconventional stage, young children develop an individualist and instrumentalist view in their relationships with others and interaction with the world.
- The conventional stage of moral development which is, according to Kohlberg (1981), the “final” stage for the majority of adults. There are two separate substages to the conventional level. A first substage, characterized by “good boy/nice girl” approval-seeking behavior (Carroll and Buchholtz 2000). And, a second substage focusing on moral behavior externally controlled by the law and the rules required for the maintenance of order.
- The postconventional stage is regarded as the final and most refined stage of moral development and consists of two substages. The first substage embraces altruism as a central concept in moral behavior or, “an understanding of social mutuality and a genuine interest in the welfare of others” (Barger 2000, p. 1). The second substage incorporates belief in

universal principles and personal moral control through conscience (Barger 2000).

Socialization-ethical fit is conceived as the fit between individual ethical orientations and expectations on joining an organization (presocialization) and the actual ethical orientation of the organization as it unfolds through induction and socialization processes (postsocialization). Kohlberg’s (1981) theory has been applied to organizational ethical orientation and individual ethical expectations by Coldwell et al. (2008). Individual ethical expectations of job seekers and their ethical fit with an organization in Coldwell et al.’s (2008) model focus on company reputation arising from its corporate social performance (CSP). The model illustrated in Table 1 modifies the original model by adding in the important dynamic of organizational socialization in person-organization fit.

The Adapted Socialization (AS) model consists of nine sections. The time factor in organizational socialization processes is central to the AS model and relevant to all nine sections of the model.

Table 1 indicates nine distinct sections. The vertical axis of Table 1 consists of levels of moral *expectations* that individual employees might hold, corresponding to the main categories of Kohlberg’s (1981) model, namely the postconventional (principled), conventional (social), and preconventional (ego) levels of moral development. The horizontal axis consists of individual *perceptions* of organizational ethics which are categorized in the same way as: principled, social, and ego levels of perceived organizational ethics.

Table 1 plots possible outcomes of the nine horizontal and vertical axis permutations arising from the organizational socialization process. For example, in the section denoted as “Fit 1” in Table 1 shows individuals with postconventional (principled) levels of moral development consonant with their perceptions of a specific organizations’ ethics as principled. In this case, various possible outcomes can be deduced from organizational socialization processes over time. Given individuals with postconventional levels of expectations and principled perceptions of organizational ethics on joining (Pre socialization,

**Company Socialization and Ethical Fit, Table 1** Socialization effects (AS) model on P-O ethical fit

|                               | Principle perceptions                                                                                                                                      | Social perceptions                                                                                                                                            | Ego perceptions                                                                                                                                                    |

Key: *R* Remains postsocialization, *Pre-soc t1* Presocialization at time 1, *B* Becomes postsocialization, *Pos-soc t2* Postsocialization at time 2

PreSoc,  $E = P$ , in Table 1) a specific company, the effects of organizational socialization processes on such perceptions can, logically, only stay the same (indicated as  $E = P$ , *R* “remains the same” in Table 1) or diminish (indicated as  $E > P$ , *B* “becomes” in Table 1). Clearly an individual with postconventional, principled expectations of organizational ethics cannot, after the effects of organizational socialization processes have occurred or continue to unravel, perceive the organization as operating at a higher-than-principled ethical level (we assume here that moral development remain relatively fixed/constant by adulthood as suggested by Kohlberg’s theory).

Similarly, individuals with a conventional level of moral development or social expectations (vertical axis in Table 1) can develop perceptions of organizational ethics after socialization processes which: remain the same, become enhanced to principled level (horizontal axis in Table 1), or diminished to an ego level through their perception of organization ethics. Finally, individuals with a preconventional level of moral development (ego expectations) can perceive organizational ethics as remaining the same through the organizational socialization process or as enhanced, but not diminished, since they are

already positioned at lowest level of moral development.

It is unlikely that an individual with principled moral expectations would join a company perceived as operating at an ego level of organizational ethics (Misfit 3 in Table 1); or that a person with a preconventional level of moral development would join a company with principled organizational ethics (Misfit 7 in Table 1), *unless other overriding factors are involved, such as unemployment levels make such behavior necessary*. In such cases, misfits can remain misfits without negative work outcome effects (such as turnover behavior). Or it is possible that the socialization process enhances perceptions of organizational ethics to the extent that earlier misfits become fits.

The “ambivalent” sections of Table 1 (sections 2, 4, 6, and 8) refer to situations where there is some degree of misfit, which may be more “tolerable” than where there are gross mismatches between expectations and perceptions (although this would also depend on the degree to which particular individuals are able to tolerate ambivalent mismatches which in turn will depend on other individually specific contingencies). However, the model suggests that such ambivalent situations are, *ceteris paribus*, most likely to

prevail without any specific negative or positive work consequences arising through organizational socialization processes. However, obviously there are many other factors relating to the individual and his/her particular personal circumstances which have a bearing on actual work outcomes. Finally, “postsocialization” can refer to formal organizational socialization processes that have a predetermined timeline, or it can refer to a longer, sometimes indeterminate, time period in which employees become aware of company values and practices.

## Compensatory Justice to Groups

J. Angelo Corlett

Philosophy & Ethics, San Diego State University,  
San Diego, CA, USA

## Synonyms

American Indians; Black slavery; Business;  
Compensatory justice; Oppression; Reparations

## Introduction

An increasing amount of research has been published in recent decades on the ethics of compensatory justice to groups. In the United States, much of said research addresses the ethics of such reparative justice to American Indians<sup>1</sup> and US blacks for the role of the US government in oppressing those peoples (Corlett 2010). This is

<sup>1</sup>By “American Indian,” I mean those peoples indigenous to what is currently referred to as the “United States of America.” Even though historically such peoples were misidentified by certain explorers as being Indians from India where the explorers thought they landed at the time, most peoples indigenous to the United States refer to themselves as “Indians” (as well, of course, by way of tribal affiliation) and out of respect for them I do so here as I do elsewhere in my published research. This linguistic custom differs from some other regions of the world wherein indigenous peoples are referred to as “First Nations” (Canada), “Aborigines” (Australia), etc. Indeed, in the United States, many nonindigenous people refer to indigenous peoples as “Native Americans,” a label, much like “Hispanic,” which is rejected by several to whom the labels refer in that the labels originate from out-group members (e.g., the US government). I am indebted to Professor Deborah C. Poff for urging clarification of this matter.

an article about the normative ethics of compensatory justice to groups which have been seriously and wrongfully harmed by businesses. The focus of this article will be on businesses in the United States, on the one hand, and American Indians (indigenous groups in the United States) and US black descendants of the transatlantic slave trade, on the other. The primary issues of this article are whether or not and to what extent ought such businesses which participated in either the serious harmful wrongdoing of American Indians or black slavery owe compensatory reparations to the descendants of said groups and why. Assumed herein is that certain of the businesses in question still exist and that descendants of the wrongfully harmed groups also exist and that there are measurable damages caused by said businesses to those they wronged.

Compensatory reparations are monetary damages paid to groups which have been substantially and wrongfully harmed by another group (such as a business or a government) in order to rectify the harm. While the moral justification of compensatory justice of this type is questionable from the perspective of social utility considerations which values the maximization of overall happiness over compensatory rights (Thomson 2002; Walker 2006), from the perspective of a rights-based theory, when a government wrongfully harms a group, then it should pay that group by way of, say, a reparations tax (Boxill 1984; Corlett 2010; McGary 1999). For instance, it is argued from a rights-based perspective that the US government owes trillions of dollars to American Indians for its genocide of them and the massive land from them and that the US government should pay a reparations tax to American Indians (Corlett 2010). However, what, if anything, should occur when the harmful wrongdoer is a business rather than a government? Examples of such cases abound. In recent years, Volkswagen has admitted to using slave labor for the Nazi regime and has agreed to pay reparations to those who were enslaved (<http://www.infoplease.com/spot/holo-caust1.html>: accessed on 20 November 2016). CXS, a US-based railroad company; Aetna Inc., a US-based insurance company; and FleetBoston, a US-based financial company, were each named

in a 2002 legal suit in the United States which sought compensatory reparations for the alleged roles each said business played in the transatlantic slave trade (<http://usatoday30.usatoday.com/money/general/2002/03/25/slave-reparations.htm>: accessed on 20 November 2016). Thus, there is clearly precedent for victims and/or their heirs to seek compensatory reparations from businesses which are guilty of committing severe and harmful wrongdoings against them.

But what is the moral reasoning concerning such matters from a rights-based perspective? Is there a morally sound basis for such reparations – even assuming that the businesses and their victims or victims' heirs still exist? A general argument in favor of business reparations to, say, American Indians and US blacks might be as follows:

1. Instances of clear and substantial historic rights violations ought to be rectified by way of compensatory reparations.
2. Business X has committed substantial historic rights violations against American Indians and/or US blacks.
3. Therefore, the historic rights violations of business X against American Indians or US blacks ought to be rectified by X by way of reparations to American Indians and/or US blacks.

There are at least three facts that need to be present for a case of reparative justice to be made. First, there must be an identifiable and existing offender. Second, there must be an identifiable and existing victim. Third, there must be identifiable and measurable damages. In the case of businesses and compensatory justice to groups, there must be an identifiable and existing business which caused the damages in question. There must be an identifiable and existing victim of set of them or their heirs. And there must be identifiable and measurable damages which the offending business is said to owe the victim(s) or heirs of the victim(s) or victim-heirs.

Many think that compensatory reparations are owed to those from whom a business net benefited in its harmful wrongdoing against a particular party. However, the net benefits argument is

problematic in that a slave owner would then not owe anything to the descendants of his slaves if he were a poor financial manager of his plantation. Yet moral common sense would tell us that regardless of the slaver's ability to manage his financial matters, he still owned slaves and, since owning humans is the violation of a human right of great importance, that slaver, should his heirs still exist, owes compensatory reparations to the heirs of his oppression. Whether or not a slaver net profited from his ownership of slaves is irrelevant to the question of whether or not his business owes compensation to those slaves and their heirs. For while guilt for the slavery does not transfer to heirs, responsibility for the compensatory reparations owed does<sup>2</sup> (DeWolf 2008).

Given the foregoing, it would follow, for instance, that the descendants of slavers such as the infamous Mark Anthony DeWolf owe to the descendants of his slaves quite a sum of unpaid slave labor given that he was one of the most successful slavers in all of the United States (DeWolf 2008). For such unpaid wages effectively make the descendants of DeWolf's slaves creditors of DeWolf's unpaid debt when he died. Thus, as it is in US laws of inheritance, nothing should have been paid to DeWolf's heirs until all of his debts were paid. Yet this debt of unpaid slave labor was not paid to DeWolf's slaves or to their heirs. Instead, it was bequeathed to DeWolf's heirs, who were bequeathed what they did not deserve in light of the fact that all creditors were not paid DeWolf's outstanding debts. While the crudest of utilitarian approaches to compensatory reparations to groups would likely deny this reasoning, they would do so at the expense of denying the moral rights of DeWolf's slaves' descendants to compensatory justice from DeWolf.

Yet it is not only the unpaid slave wages that must be paid as reparations to US blacks; it is also the human rights violations that must be compensated, morally speaking. Similarly, American Indians are owed compensatory reparations for

both the genocide of their peoples and for the massive theft of their lands. Since several businesses, some of which persist to this very day, participated in such human rights abuses, they must be brought to justice – compensatory justice.

What about other businesses in the United States which participated in the enslavement of blacks and/or the genocide of American Indians and the theft of their lands? If those particular businesses have survived until today, and if members of the Indian nations (or the descendants of the slaves) who were wrongfully harmed by said businesses still exist, and if damages can be measured, then there is a case to be made for compensatory reparations from those businesses to those groups.

Other US-based businesses which profited by slavery include Lehman Bros., Aetna Inc., J.P. Morgan Chase, New York Life, Norfolk Southern Railway, the oldest and largest US investment bank and securities firm Brown Brothers Harriman, the retail suit manufacturer Brooks Brothers, and US Life Insurance (now owned by AIG) (<http://atlantablackstar.com/2013/08/26/17-major-companies-never-knew-benefited-slavery/>; accessed on 22 November 2016). And those which profited by the genocide of American Indians and the theft of their lands include every single US business in that each is in violation of the Principle of Morally Just Acquisitions and Transfers: Whatever is acquired or transferred by morally just means is itself morally just, and whatever is acquired or transferred by morally unjust means is itself morally unjust (Corlett 2010). This implies that to the extent that each and every US business operates on land that is in violation of this principle, each such business owes American Indians compensatory reparations as, morally speaking, it belongs to American Indians. Such businesses cannot exist in this territory without the violent or otherwise immoral theft of such land. Simply because a group of Europeans came, uninvited to "settle" and steal the lands of North America, in no way gives them, or the United States, Canada, or Mexico, morally legitimate claims to said lands. Having moral legitimacy requires, among other things, a valid moral claim to the territories in question. Yet as history clearly testifies, such

<sup>2</sup> That responsibility but not guilt can obtain between generations is found in Feinberg (1970).

lands were acquired and transferred in violation of the principle of morally just acquisitions and transfers. Thus, such countries lack moral legitimacy and ought to pay compensatory reparations to the remaining American Indian nations.

While it runs against the traditional American Indian belief to exchange anything, especially money in the form of compensatory reparations, for land which is considered by Indians to be their Mother, compensatory reparations, if they are paid in good faith, can assist American Indians in reacquiring and protecting some of their lands from further encroachment.

On the face of it, it might seem to some that a policy of businesses which are guilty of serious harmful wrongdoings against such groups is a kind of double-dipping in that it has already been argued that the US and various other governments owe reparations to such groups (Corlett 2010); this does not constitute a double-dipping of compensatory reparations because businesses are considered to be persons in and of themselves. Thus that reparations taxes are owed by certain governments to said groups is not the same as the question of whether or not certain businesses within such countries owe such reparations to them. This mode of operation would be consistent with the idea that, in imposing fines on businesses duly convicted of crimes, the court ought to first do all that it can to fine those individuals most guilty of the crimes before the court imposes fines on the guilty business. This of course assumes that there is no limited liability for business individuals, a law that would require the retraction of corporate limited liability laws in the United States. Indeed, those who engage in business should be held legally liable for their own responsibility for harmful wrongdoings. There appears to exist no morally sound argument to the contrary. What is so special about business that those who engage in it ought to be immune from their own responsibility for the harmful wrongdoings they cause?

While most of the foregoing discussion has centered on the basic reasoning underlying the claim that US businesses ought to pay compensatory reparations for their historic rights violations, contemporary businesses which substantially

violate the rights of others ought to be forced to pay reparations to such groups. Just as contemporary businesses must compensate individuals who they wrongfully harm, so too must they be forced by law to compensate groups they harm.

The most recent US military invasion and occupation of Iraq is an example wherein the precepts of just war theory were violated by the United States, and yet the invasion was carried out and is still in effect. To the extent that the United States is in substantial violation of what is necessary and sufficient to justify a military invasion, the United States and its allies owe substantial compensatory reparations to Iraq. But it is not only the United States and its government “coalition of the willing” which owe such reparations; it is also the hundreds of businesses that participated, uncoerced, in said invasion. Morally speaking, it is as if a bully started a fight with an innocent person, and others assisted the bully in the fight. While the bully is primarily guilty of and responsible for the fight and most or all of the damages that accrued, those who assisted the bully share in the bully’s guilt and responsibility. This includes those in the US Congress, such as Hillary Clinton, who proudly voted to give then US President G. W. Bush the authority to declare war on Iraq, ought to be punished in manners that would be proportionate to their roles in starting that unjust invasion and occupation. Since any person using common sense can discern that a military invasion of that sort would mean almost certain death of thousands of innocent people, it is clear that those most directly responsible for declaring the unjust invasion ought to, if they are duly convicted in a court of law, be executed as war criminals no different than some of the Nazi war criminals in Nuremberg. And those in the US Congress who voted in favor of giving Bush the authority to invade Iraq for insufficient reason must be sentenced to substantial prison terms for their war crimes of enabling Bush and company to officially declare the invasion. All of this is part of what constitutes reparations for that war crime against Iraq (Corlett 2014).

Thus, those businesses which provided transportation, private companies providing private mercenaries like Blackwater, USA (now XE

services), etc. each owe compensatory reparations to Iraq to the extent that they participated in the immoral invasion and occupation of Iraq. This would especially include any businesses which lobbied Congress and/or the US president to invade Iraq. Each such business must subsequent to due process and thorough investigation be forced to pay proportionate reparations to Iraq for its role in that unjust invasion and occupation.

Also, compensatory reparations would be owed to the American Indian nations, including the Standing Rock Sioux nation, of the North and South Dakota regions due to the violation of their land rights by the Energy Transfer Partner which is the contractor in charge of constructing the oil pipeline. For while the pipeline is being constructed on US federal land, that land was stolen from the Sioux centuries ago, and so any construction on it that is done without Sioux's approval is without moral standing, thus the need for the ceasing of the construction. The construction is reported to also threaten the sole water source of the Standing Rock Sioux nation and also sacred burial grounds.

Many would argue that some of the foregoing reasoning in favor of compensatory reparations is impractical and would require virtually all business development to halt. But this is an essay in ethics and business. As such, ethics must play a primary role in our thinking and behavior, and this implies that the principle of morally just acquisitions and transfers must guide our thinking and behavior. Perhaps it is time for business ethics to finally begin to take American Indian and US blacks rights seriously. If this is done, then their respective rights to compensatory justice must also be taken seriously. And if this is done, then business life as we know it may change forever and quite substantially. Perhaps that is how it ought to be, that is, if ethics is taken seriously and we are not presumptuous about the "rights" of businesses.

Shallow business ethics presumes that businesses should occupy a preeminent place in society. Deep business ethics makes no such assumption on way or another about the role of businesses in society. Rather, it places rights in a

preeminent place. As much as is reasonable, moral rights ought to be protected by legal rights. And rights violations, by governments, individuals, or businesses, must be rectified. This much is required of any reasonably just society. And the interests of any business which run afoul of rights must be made to comply with such rights. For this is the essence of the case for compensatory justice to groups in the context of business.

## Conflict of Commitment

Geraldine S. Pearson  
 UCONN Health, Farmington, CT, USA

## Synonyms

Conflicts of interest; Value clarification

## Definition

Conflicts of commitment are specific types of conflict of interest. Conflict of interest is generally defined as a situation where a person is in a position of trust and authority and is supposed to decide between alternative choices rationally and with unbiased fairness but where one decision benefits the person deciding either directly or indirectly. In the case of a conflict of commitment, the difference is that the choices may be one where the decision-maker may be altruistic and not self-motivated but may still be in conflict. In these cases, a conflict may be between two or more professional commitments that will potentially affect “one’s focus of time, attention, and responsibility” (Werhane and Doering 1995, p. 51).

Conflicts of commitment are differentiated from conflicts of interest because they “involve the distribution of focus and effort between two sets of professional obligations, rather than a conflict between professional and financial/recognition interests” (Werhane and Doering 1995, p. 61). Conflicts of commitment can include consulting, lecturing, acting as an expert witness, or service on a professional board or committee. In the case of consulting, the conflict may be between loyalty to a client and loyalty to the employer if the findings may in some way embarrass the institution. They may also arise between two mutually beneficial commitments whose competing interests cannot be both satisfied at the same time (e.g., serving on a hospital board and a university both of which require fundraising efforts by board members within the same time period). These are generally but not necessarily activities that may detract from the primary commitment of the individual. While professionals in business or university settings can never be completely free of these competing commitments, they do need to evaluate, acknowledge, and address their existence.

## What Are the Issues?

Conflicts of commitment differ from conflicts of interest in subtle but important ways. Conflicts

of commitment are “conflicts that entail a conflict between two or more sets of professional commitments that will affect one’s focus of time, attention, and responsibility” (Werhane and Doering 1995, p. 51). An example of this might be a university faculty member or business executive who invents a piece of equipment and receives financial compensation for this but does not disclose the activity or the income to his university or primary place of employment in spite of clear regulations about declaring other income. Another example of this might be a university professor who sits on a medical school admissions committee but also sits on the board of directors of a company that provides teaching for medical school entrance exams. Conflicts of interest, in contrast, describe competing demands between professional interests and personal or financial interests. An example might be an employee who requests days off to attend his child’s sports practice even though these days occur during significant reviews within the company in which the employee is a key person.

## What Are the Ethical Issues?

In business organizations value congruence is considered to be a determinant of job-related outcomes (Schwepker 1999). Incongruent ethical values between the individual and the organization may affect commitment and ability to remain in the work environment. The resulting ethical conflict comes from the lack of shared values between the individual and the organization.

The organization assists in the clarity and communication of the ethical values of the system to employees. Identifying, communicating, and practicing the ethical standards is the first step in diminishing the conflict of commitment that can emerge when ethical standards are not clear or not enforced and valued within an organization.

The ethical dilemmas involved in academic medicine and pharmaceutical research have illuminated the pitfalls and risks of a conflict of commitment. Kachuck (2011), in commenting about ethical issues that arise in the relationships

between primary and secondary interests, notes that “a conflict of commitment occurs when primary interests are discordant, and when we assume roles that may have overlapping, but not identical primary interests.” He maintains that conflicts of interest occur when a secondary interest compromises the integrity of judgments related to the primary interests. In both situations secondary interests may be nonfinancial.

In the example of the university faculty on admission’s committee voting on decisions about medical school acceptance, the conflict is not financial but is based in the individual’s conflict of commitment to her role on the committee versus her unacknowledged role on a board of directors of the testing company. Her behavior challenges the process of transparency of commitments, essential to the stated value of the committee and the university.

### How Are Conflicts of Commitment Managed?

The Internet is populated with numerous university directives about managing conflict of interest and commitments for staff and faculty. The central themes of these directives involve clarity about the meaning of employment in the work environment, boundaries about financial and nonfinancial involvement in other activities, and clarity in declarations if involvement in those other activities does occur.

The keyword in management of conflict of commitment is transparency from all parties involved including the university, the corporate entity, and the individual employee. Conflicts of commitment, while viewed as inherently negative, might be managed positively if negotiated openly with employers before beginning a position *or* openly acknowledged as potentially occurring during employment. Hidden, secretive activities omitted from discussion with employers are the actions that cause doubt and suspicion and ultimately might result in ending the employment relationship.

### Conclusions

Individuals with concerns about their various commitments should be encouraged to discuss this with superiors in their work setting, regardless of the environment. Knowledge of and adherence to stated regulations are essential to effective functional and management of potential conflicts of commitment. The key is recognizing, acknowledging, and dealing with the conflicts that can influence work behaviors.

### Conflict of Interest in Research

Jessica Carrick-Hagenbarth  
Department of Economics, SUNY, Cortland,  
NY, USA

### Definition

A conflict of interest occurs when reasonable observers perceive a significant risk that an individual’s judgment or actions regarding a primary interest is inappropriately influenced by a secondary interest. Aside from *actual* misconduct that may occur, conflicts of interest can also create the *perception* of misconduct, engendering suspicion,

and mistrust of the individual. Conflicts of interest can be either financial or nonfinancial. Financial conflicts of interest occur when a person is in the position to receive a potentially significant financial payoff that is at odds with their professional duty or at odds with their obligations to the primary party.

Nonfinancial conflicts of interest occur when a person's nonfinancial interests conflict with a person's ability to carry out their professional or public obligations, or when they cause a person to inappropriately favor one contracted party over another. Nonfinancial conflicts of interest can stem from a variety of sources, for example, political, religious, or ideological beliefs; academic commitments; personal relationships; or institutional affiliations. An academic may face nonfinancial conflicts of interest in a variety of roles, for example, when teaching, serving as a journal reviewer, or voting on tenure decisions.

Most attention has been given to financial conflicts of interest as they can be more objectively defined, more impartially regulated, and are more easily dealt with. Less attention to nonfinancial conflicts of interest has resulted in fewer procedures for evaluating and addressing such matters.

## Policy

Professions are based on extensive training and specialized knowledge. They hold power and prestige inasmuch as the society regards them as necessary and useful. Professions rely on the ethical behavior of their members to establish and retain the profession's integrity and trustworthiness. A researcher employed by a university, a research institution, or engaged in policy or governmental work has a significant responsibility to the public to act honestly and follow "good practices" in providing credible, rigorous, and robust research. While most professions have established a code of ethics for their discipline (which often includes a conflict of interest policy), many economics and business associations do not have consistent, widespread conflict of interest policies. Conflicts of interest can create bias and hinder the ability of professionals to carry out their

professional obligations and ensure research integrity, vital for securing trust in a profession.

The Great Recession in the 2000s revealed problematic potential conflicts of interest between some elite academic, financial economists, and private financial institutions. In a study of a group of prominent academic economists lobbying around financial reform, fifteen of the nineteen economists studied had private financial affiliations over the period 2005–2009, and the great majority of these economists failed to disclose their private financial affiliations in their academic or their public work related to financial reform (Carrick-Hagenbarth and Epstein 2012). These financial affiliations included owning shares in financial institutions, serving on one or more boards of financial institutions, and consulting for financial institutions. Perverse incentives, including conflicts of interest, have been cited as a contributing factor to why many of economists failed to recognize financial fragility leading up to the Great Recession.

Other professions can provide additional examples of how conflicts of interest create bias and affect research. The academic medical profession has become increasingly interwoven with industry funding. For example, a national survey in the United States conducted in 2006 of 459 department chairs in medical schools and independent teaching hospitals found that over 60% of those chairs had significant ties to industry (as consultants, board members, paid speakers, etc.), and 67% of the academic departments had ties with industry (Campbell et al. 2007). The Institute of Medicine (2009) reviewed several meta-analyses of industry-supported pharmaceutical studies. The report found financial ties between investigators and manufacturers typically had a strong association with positive pro-industry results and biased reporting of results.

The American Association of University Professors (2014) presented an overview of the strategy the tobacco industry employed to "distract and confuse" from the mounting scientific evidence that tobacco was harmful to health. The tobacco industry used financial payments, funded academic studies, and financial conflicts of interest to buy academics. Although the actual number

of academics working as paid researchers and consultants was low, it was enough to cast doubt of the negative effects of tobacco on health. This strategy for creating scientific doubt and manipulating scientific evidence is perhaps the clearest indication of how financial conflicts of interest can be used to cause harm. The AAUP notes this same strategy has been used by a variety of industry groups, including most recently those seeking to obfuscate the environmental and economic threats of global warming.

There is evidence that financial conflicts of interest cause bias. The psychology literature identifies two main problems pertinent to conflicts of interest people encounter in objectively reviewing conflicting information: cognitive dissonance and bias blind spots. Cognitive dissonance occurs when there is an inconsistency between a person's beliefs or between a person's actions and their beliefs. Generally, people try to reduce cognitive dissonance, either consciously or unconsciously. For example, a person may seek new information supporting one of the beliefs or actions or may re-frame one of the beliefs or actions so that it carries more weight than another. Dissonance reduction is one way to explain how a person confronting a conflict of interest can rearrange their values to reduce the perception of the conflict as problematic in their mind, making the belief or action more amenable.

Bias blind spots are another way in which people do not recognize unethical behavior in themselves. Studies of students, medical faculty, and medical residents have all identified a bias blind spot, in which these people on average claim themselves to be less biased than their peers or colleagues (Dana 2009). Evidence from the research on bias blind spots and cognitive dissonance imply conflicts of interest cannot be effectively managed solely by the individual holding the potential conflict of interest.

## Regulation

Research conducted in the professions occurs most often in universities, research institutions, government positions, and research arms of

businesses. Guidelines for ethical research occur at a variety of levels. Most professions have nationally based professional associations which provide guidelines for ethical behavior, often including a conflict of interest policy. Many national research agencies have created research integrity codes that researchers and institutions who receive funding from these agencies are required to follow. At the global level, the Singapore Statement on Research Integrity (2010) aims to provide international ethical guidelines for researchers, institutions, and governments.

In addition to professional guidelines (or when such guidelines do not exist), the regulation of conflicts of interest as they pertain to the research conducted by academics and professionals is often the responsibility of their institution of employment. Professionals that work for universities, governments, research institutions, or research arms of businesses are subject to a conflict of interest policy if these institutions have them.

University policies vary in strength and implementation. These policies may address three types of conflicts of interest: financial conflicts of interest, conflicts of commitment, and conflicts related to human subjects. Most universities in the United States require that faculty members consider the university to be their primary interest and to report outside activities to the university or college for review as secondary interests. Many universities consider some involvement in outside activities to be of value not only to the faculty but also to the university. As such, many of these activities are permitted following disclosure to the university.

Financial conflicts of interest are often defined as a monetary quantity over a particular period. A conflict of commitment occurs when the quantity of time and the quality of a faculty member's work for the university are compromised by another commitment. Often conflicts of commitment are intertwined with financial conflicts of interest.

Research involving human subjects has received considerable attention with respect to conflicts of interest. Many ethics policies around the world were formed in response to experiments in the medical field that crossed

ethical boundaries. In academia, customarily studies involving human subjects must be reviewed and pass muster by an ethical review board or committee before they can be implemented. Such boards are omnipresent in many developed nations and are increasingly present in low and middle income nations for biomedical research.

### Institutional Conflicts of Interest

In addition to the conflicts of interest individual researchers might hold, universities can also have conflicts of interest. Institutional conflicts of interest “refer to situations in which research, teaching, or service are compromised because of external financial or business relationships held at the *institutional level* may bring financial gain to units or the institution in form of increased revenues, whether payments or donations, or when external financial relationships have the potential to influence decision making regarding these activities” (Slaughter et al. 2009). The main actors affected here are those with some administrative clout to influence the direction of research at the university level. Slaughter et al. explain such conflicts might come about when the university stands to gain financially through a particular line of research of its faculty (for example the creation of patents) and results in the administration acting on commercial rather than academic interests, or a relationship in which the University receives funds from industry and in return the industry can use the university’s name or the university uses the affiliated business’s products.

Institutional conflicts of interest fall under the university policy, when such a policy exists (such policies exist in some form for the majority of American universities). Ordinarily, institutional conflicts of interest are dealt with on a case by case basis. Similarly to conflict of interest policies for individual professionals, institutional conflict of interest policies vary in strength, implementation, and depend heavily on the quality of implementing committees and senior officials.

### Disclosure, Management, Recusal

Conflicts of interest can be dealt with in three ways: disclosure, management, or recusal from the conflict of interest. For example, the American Association of University Professors 2014 advocates for the elimination of the conflict of interest, or for its disclosure, and when applicable a plan for its management. Two cases illustrate some possible approaches to addressing potential conflicts of interest, the field of economics, which has some of the least developed approaches, and the field of medicine, which has some of the most sophisticated sets of rules.

Aside from university policies academic economists fall under, most economics professional associations have provided few rules or guidelines. Disclosure has been by far the most popular response to dealing with potential conflicts of interest for academic economists. Some journals have begun to require disclosure and some academic economists have begun to voluntarily disclose on their own websites. Yet, there are no universal standards for dealing with conflicts of interest. Management of conflicts of interest for academic economists has received little attention. Recusal is particularly unpopular for two reasons. One, business and academia are becoming increasingly intertwined. Two, economists see value in holding positions in business which provide insight into the way the economy functions.

The medical field has perhaps the most sophisticated sets of rules for dealing with potential conflicts of interest. In the United States, the Institute of Medicine guidelines (2009) acknowledges the benefit that can come with the merging of industry and research institutions, but they also recognizes the potential risks to research integrity and participant well-being that accompany financial conflicts of interest. In response, the Institute of Medicine report recommends that “Academic medical centers and other research institutions should establish a policy that individuals generally may not conduct research with human participants if they have a significant financial interest in an existing or potential product or a company that could be affected by the research”

(pp. 117–118). The report lists some exceptions, such as if the study could not be completed without the participation of the particular person with the conflict of interest, noting that in such a case, a plan must be implemented to monitor the conflict of interest. Generally, the medical field requires, at a minimum, conscientious disclosure and sometimes advocates for the complete avoidance of financial conflicts of interest.

## Conclusion

Conflicts of interest are present for academic researchers and academic institutions. For the most part, professions have restricted themselves to regulating financial conflicts of interest. The majority of policies to address potential conflicts of interest either for the individual professional or an institution resides primarily at the university level. As most potential conflicts of interest are reviewed on a case by case basis, the quality of the outcome depends to a great extent on the implementing committees and senior officials.

## Confucianism and LGBTQ+ Rights

Robert Shanklin

Philosophy Department, Santa Clara University,  
Santa Clara, CA, USA

## Synonyms

Civil and human rights in a Confucian-influenced cultural context; LGBTQ

## Introduction

Confucianism continues to influence culture and society in Hong Kong, Taiwan and on mainland China as well as in Japan, South Korea, and Vietnam. Its ideas influence the day-to-day activities, including business and commerce, of over 21% of the world's population (US Census Bureau 2020). As a way of life, Confucianism is considered both a philosophy and a religion, one which exists side by side with Daoism (“Taoism”), Buddhism, Animism, and other beliefs about the natural and supernatural world. On the whole, Confucianism focuses primarily on human lives and how they may best be lived. Among its core values are benevolence (*rén* 仁, also translated “humane-ness”), wisdom (*zhì* 智), propriety (*lǐ* 禮), uprightness (*yì* 義), and filial conduct (*xiào* 孝). Confucian notions of filial conduct emphasize family and respect for seniority, especially male seniority (Ames and Rosemont 1999). This concept of family is broadly understood as holding individuals socially responsible for marrying and producing children with the purposes of continuing the family line and caring for aging parents. As a result, LGBTQ+ people in Confucian

cultural contexts experience significant familial as well as social pressure to suppress their own desires, happiness, and well-being. Though there is significant variation in severity across East and Southeast Asia – for example, between Taiwan and Hong Kong on the one hand and mainland China on the other – LGBTQ+ people, issues, and identities remain largely silent and invisible (Chiang 2018; Tamagawa 2018; Wang et al. 2020).

## Society and the Workplace

In much of East Asia and Vietnam, the social and professional aspects of Confucian cultural influence are largely inextricable. This is because professional and personal life are far less separated there, and particularly in China, than is typical in Western countries (Santoro and Shanklin 2021). As a result, there is little separation between what counts as socially problematic versus professionally problematic influences of Confucianism. Moreover, it is common to view relationships among peers and colleagues as analogous to family relationships in certain ways – the family is where one learns to build and maintain relationships, then one extends that framework for treating relationships to one's friend, social, and professional networks. Thus, while filial conduct is at its core a familial concept, it grounds and guides norms of behavior in personal and professional relationships, especially relatively close ones, outside the family. The consequences of this most relevant to LGBTQ+ experiences in the workplace are the patriarchal and hierarchical aspects of filial conduct. Subordinates are expected to be deferential to superiors, where superiority is typically defined by job title as well as age. In much of East and Southeast Asia, seniority in terms of rank is closely correlated with age – there is a widespread sentiment roughly to the effect that opportunities to advance and make change in organizations require tremendous patience as one waits for the senior men to retire.

This high degree of deference to seniority is driven not just by Confucian views of hierarchy and respect for seniority, but also by widespread

cultural beliefs in the importance of maintaining harmony within social groups, businesses, and other organizations (Santoro and Shanklin 2021). In *Analects* 4:18, Confucius describes how to handle disagreements with parents, which again is taken as a model for handling disagreements with authority figures in general: “In serving your father and mother, remonstrate with them gently. On seeing that they do not heed your suggestions, remain respectful and do not act contrary. Although concerned, voice no resentment” (Ames and Rosemont 1999, p. 93). The parents in this passage are widely understood as placeholders for managers, executives and other leaders. The Confucian paradigm therefore prioritizes outward deference, whatever one's internal emotional state, so as to maintain the smooth functioning of the social unit, whether that be family, friend-group, work-unit, department, and so on. While businesspeople generally feel these pressures in Confucian-influenced cultural contexts to some degree or other, LGBTQ+ businesspeople typically feel these pressures more acutely. Not only must one remain respectful and comply with the directions of superiors, but one is expected to acquiesce deferentially to widespread suppression of LGBTQ+ people, experiences, relationships, and identities.

## Rights and Sources of Pessimism

In much of the world, rights have proven an important vehicle for protecting the interests of an individual, minority, or oppressed group against those of society, business and/or government. Especially in the Western world, rights-talk and -activism, in this case LGBTQ+ rights including marriage equality and legal antidiscrimination protections, are key means by which groups challenge and in some cases overcome the sorts of issues described above. Though progress is sometimes, indeed often, inhumanely slow, the articulation of rights-violations and the processes of ensconcing rights-protections into legal systems has resulted in major progress in increasingly many places around the world.

Notoriously however, rights, including civil rights and particularly human rights, do not translate well into East and Southeast Asian culture contexts. (For an up-to-date discussion of why and of some broader implications for international business, see Santoro and Shanklin 2021. There is an ongoing debate whether LGBTQ+ rights are human rights, civil rights, or both, but this article does not take a stand on that debate.) Rights as they are generally understood today are an ethical and legal framework developed (or discovered, depending on your background philosophical commitments) roughly 350 years ago during the European Enlightenment. Contemporary notions of rights are therefore Western and did not develop out of either indigenous or long-standing philosophies of East and Southeast Asia.

Not only do rights as a framework not fit well philosophically with Confucianism, there are several reasons why societies influenced by Confucianism are, to varying degrees, broadly resistant to rights-talk and -activism. For one, as suggested above, these societies' cultures tend more toward collectivism than individualism, in that individuals are generally expected to subordinate their interests to those of collectives of which they are members (families, work-units, departments, companies, etc.). This cultural tendency is directly at odds with one of the main purposes of positing rights in the first place – to advance and protect the interests of individuals, minorities, and oppressed groups. Another reason for this resistance is that there is a widespread and deeply engrained cultural distaste for adopting foreign ways and ideas when they are perceived to be at odds with traditional forms and values of East- and Southeast-Asian cultures. This is in large part because of how poorly many of these societies fared at the hands of foreign, specifically European and American, powers in the nineteenth and twentieth centuries. Resistance to foreign ideas is exacerbated when foreign powers accuse East- and Southeast-Asian countries of civil and human rights violations, when those very same Western powers have their own, often egregious, histories of rights violations. This suggests hypocrisy and is furthermore reminiscent of times when foreign powers imposed themselves culturally, militarily,

politically, and economically upon East- and Southeast-Asian societies, often to the detriment of those societies. (Examples abound, including: the Opium Wars, the Boxer Protocol, annexing Hong Kong, foreign-backed conflicts in Vietnam and Korea, military-backed pressure from France, Britain, and the USA to open Japan to foreign trade, etc.) Finally, many countries and cultures in East and Southeast Asia are old – in several cases, millennia old and hence much older than American and European counterparts. In Confucian contexts, age goes along with seniority and authority, so rights arrive in East- and Southeast Asia with multiple demerits: not only are they a foreign notion, where that comes with significant cultural baggage, but by Asian standards they are a Johnny-come-lately one on top of that. The accumulation of these factors often results in national indignation in response to foreign criticism about rights violations, as well as to foreign pressure to respect civil and human rights in general, and LGBTQ+ rights specifically. Altogether, these factors constitute significant barriers to the adoption of rights talk and activism as means to improve conditions for LGBTQ+ people in Confucian-influenced cultural contexts.

Traditional values and ideals continue to exert considerable influence on contemporary thought and behavior, including public perceptions. Same-sex couples who marry abroad and return home often choose to hide their status and face significant backlash both in person and online if they do not. In China, for example, homosexual couples living together continue to be harassed and even prosecuted, not under anti-LGBTQ+ laws, but under public nuisance laws (Rofel 2007, pp. 85–110). One scholar, Zeng Yi, publicly called same-sex marriage an “anti-human crime” (Tsoi-lai 2015). Another scholar, Fang Xudong, quoted the early Confucian Mencius (*Mèngzi* 孟子) in support of his claim that the Confucian duty to produce children outstrips one's own need for happiness, while simultaneously asserting: “Confucians don't have any discrimination against homosexual people” (Sheehan 2017). Perhaps Fang Xudong would be surprised to learn that the Confucian canon was cited in support of same-sex marriage in the US Supreme Court's

decision on *Obergefell v. Hodges*, though that reference was ridiculed by Justice Antonin Scalia in a note to the dissenting opinion as mystical aphorisms of the fortune-cookie.

Further pessimism derives from varying and often limited legal protections for LGBTQ+ people in many East- and Southeast-Asian jurisdictions. Same-sex activity is legal in China, Vietnam, Japan, and South Korea. In fact, in Vietnam it may never have been criminalized, and in Japan was criminalized only briefly in the late nineteenth century. Homosexuality is not mentioned in the South Korean constitution. In China, however, homosexuality was decriminalized in 1997 and removed from the official list of mental illnesses in 2001 (Sheehan 2017). There are laws allowing for legal change of gender in Vietnam and South Korea. There are similar protections on Taiwan as well as laws protecting against anti-trans discrimination in education. There are laws protecting sex reassignment treatments in South Korea and Japan as well as in Taiwan. However, broad national anti-discrimination protections relating to sexual orientation and gender identity are absent. Other than the education protection on Taiwan, when any such protections are present, they tend to proceed on city-by-city (China, Japan) or county-by-county (South Korea) bases. Confucianism per se does not appear to be a major cause of these realities – political histories are plausibly more important factors – but legal protections for LGBTQ+ persons as they relate to the workplace and elsewhere remain less developed in Confucian-influenced societies than in some others.

The combined influences of patriarchy, heteronormativity, hierarchy, social harmony, and ideals of filial conduct, all of which are distinctive of Confucian-influenced cultures dilute widespread public support for legal LGBTQ+ protections (Rofel 2007). Those influences further combine with widespread homo- and transphobia that persist in varying ways and degrees in all the cultures discussed here, though it is worth noting that experiences on Taiwan and Hong Kong have often been significantly less negative (Chiang 2018). In the workplace, together with cultural

tendencies toward collectivism over individualism, all these socially ingrained norms form a dense barrier to progress that reinforces desires not to stand out – as a Chinese proverb has it, “the nail that stands out gets hammered down.” Hence, while there have been pride parades – on Hong Kong and Taiwan, in Hanoi and many other cities in Vietnam, in Seoul and many other cities in South Korea, in Tokyo, and other cities in Japan – there are strong cultural disincentives to be visible and heard in the workplace and day-to-day life generally.

### Some Sources of Optimism

Despite myriad causes for pessimism, there are some grounds for optimism. In Japan, Vietnam, South Korea, and on Taiwan, where there is relative freedom of information, online communities have formed and constitute forums for discussion and advancement of LGBTQ+ interests. These are proving instrumental in helping LGBTQ+ people, especially youth, better understand themselves and their situations, as well as providing guidance on how to manage coming out to family, friends, and coworkers. In Japan and mainland China, for example, some LGBTQ+ people report that it is easier to come out to schoolmates, friends, and coworkers than to family (Rofel 2007; Tamagawa 2018). In addition, on mainland China, slowly but surely the internet generation will come into power, and despite close government controls, it is reasonable to think that this will open some doors to greater progress. A 2014 survey by *The Chinese Journal of Human Sexuality* indicated that nearly 85% of Chinese people already supported same-sex marriage (Tsoi-lai 2015). Some companies have taken it upon themselves to support their LGBTQ+ employees, for example, Alibaba has officially endorsed same-sex marriage, and together with Chinese LGBTQ+ oriented dating app Blued, has sponsored same-sex destination weddings outside China (Sheehan 2017).

There is even some reason for optimism, or at least hope, that LGBTQ+ civil and human rights, as well as rights generally as a legal-ethical

framework, will continue to gain ground in East- and Southeast Asia. Though Western in origin, there are non-Western declarations on human rights, including the Cairo Declaration on Human Rights in Islam of 1990 and the Bangkok Declaration of 1993. The latter sought to synthesize elements of the UN's (so-called) Universal Declaration of Human Rights together with Asian values including those discussed here, and with principles of national sovereignty as well as non-interference by foreign powers. Though the Bangkok Declaration stipulates significant qualifications to the UN's Declaration, as of the end of the twentieth century and into the twenty-first century, rights are becoming an increasingly global framework for articulating and addressing oppression, inequality, and other challenges facing LGBTQ+ as well as other populations.

There is evidence that, at least in some Confucian-influenced cultures, the most promising way forward, at least for the foreseeable future, will likely involve other approaches taken in concert with rights-based approaches. For example, recent research suggests that in East- and Southeast Asia, it is more beneficial to approach coming out not as a discrete (if repeated) moment of disclosure of one's sexuality or sexual identity to family, friends, or coworkers. Rather, many find it more productive and less risky to approach coming out as an iterative or "scaffolded" process that aims to maintain family and social-group harmony and integrity while overcoming specific sources of conflict between sexual minority individuals and those to whom they are coming out (Tamagawa 2018; Jhang 2018).

Among the most commonly reported sources of conflict are those one would predict given the discussion above: heteronormativity, the expectation that couples will produce children, and that children will care for aging parents as well as concerns about the homo- and transphobia that individuals will face. Iterative strategies are as varied as the specific realities of the individuals, families, social- and work-groups involved. However, effective strategies include: (a) articulating and critically examining one's own expectations as an LGBTQ+ person; (b) articulating and

critically examining parents/friends/coworkers' expectations; (c) slowly and subtly exposing sexual majority individuals, especially those with power within the relevant group, to LGBTQ+ friendly ideas; (d) as possible, slowly, and subtly exposing sexual majority individuals to positive depictions of LGBTQ+ people, (e) allowing LGBTQ+ status to be an "open secret" within the relevant group (in contrast to many Western LGBTQ+ peoples' expectations or hopes for overt acceptance and/or support), and; (f) slowly rather than suddenly introducing displays of affection such as hugging or holding hands (Jhang 2018). Though the last may be more relevant among family and friend-groups than in the workplace, these are among the types of techniques that have shown themselves effective. It must be acknowledged, however, that this type of approach places significant long-term burdens on LGBTQ+ people to manage the feelings, expectations, and understanding of the surrounding sexual majority people, including those with power over relationships, employment, and advancement. Also, as indicated above, improving conditions for LGBTQ+ people and other oppressed groups is often an excruciatingly long and inhumane process – this may be perpetuated by the long time-scale of the types of strategies just described.

## Conclusion

Though there is significant geographical variation, LGBTQ+ rights, both civil and human, have limited recognition and protections in Confucian-influenced societies and cultures. While rights-talk and -activism arguably continue to gain ground globally, both remain in tension with ingrained foundational values and ideals of Confucian societies, including heteronormativity, patriarchy, hierarchy, inter-group harmony, and filial conduct as well as widespread and often socially accepted homophobia and transphobia. In part, because of East- and Southeast Asian cultural-philosophical environments, civil- and human-rights talk tend to muddy debates about LGBTQ+ issues in these areas in large part because doing so introduces additional

controversies surrounding rights-talk and -activism to the conversation about LGBTQ+ status. Despite these challenges, rights as a legal and ethical framework remain a primary means for articulating problems and protecting the interests of individuals and groups against society, business, and government. There are some grounds for optimism arising not only from the global spread of rights as a framework, as well as of rights-talk and -activism, but also from promising, if painstakingly slow and burdensome, supplementary strategies for increasing visibility and acceptance among family, friends, and coworkers. It is not clear how things are most likely to go for LGBTQ+ people in the foreseeable future in Confucian cultural contexts. On the one hand, it appears that processes will likely remain slow and arduous, placing undue burdens on sexual minority individuals, groups, and organizations. On the other hand, international awareness of, and pressure toward equal protection continue to rise as increasingly many countries legalize same-sex marriage.

## Conscience in Business and Organizations

Sheldene Simola  
School of Business, Trent University,  
Peterborough, Canada

## Synonyms

Compunction; Inner voice; Self-judgment; Superego

## Introduction

In philosophical terms, conscience refers to the consciousness that individuals experience relative to their own actions in given situations, and more specifically, their judgments about whether these actions are consistent with their own internally held moral values, principles, and beliefs. A commonly ascribed aspect of conscience is that it facilitates integration of, or integrity between, the actions in which individuals engage, and the values, principles, and beliefs to which they subscribe and that they espouse (Baylis

2015). Specifically, when individuals engage in actions that violate their own moral standards, they experience undesirable, disquieting emotions such as guilt or shame that they wish to avoid. Conversely, when individuals engage in actions that are consistent with their own moral standards, they experience desirable, harmonious, or peaceful emotional states that they seek to maintain. Because different individuals prioritize different values and subscribe to different beliefs, subjectivity is a key characteristic of conscience.

### **Conscience in Business Ethics: Overview**

Within business ethics, the meaning and nature of conscience has often been left implicit, or briefly described as a construct that involves conscious ethical awareness, as well as processes of self-reflection on one's actions, feelings, thoughts, judgments, and integrity in relation to that ethical awareness. Kenneth E. Goodpaster offered a more robust discussion.

Goodpaster (2000) contrasted conscience with processes of mindlessness, thoughtlessness, and nonconscious self-deception, or uncritical reliance on organizational goals, technical requirements, legal regulations, policies, or value statements as corporately sanctioned substitutes for conscience. Goodpaster (2007) coined the term *teleopathy* to refer to a narrow and unbalanced quest to fulfill certain (organizational) goals in ways that could neglect moral consideration about both the means of attaining those goals, and the end goals themselves. He argued that fixation on such goals and rationalization of actions used to obtain those goals could, over time, result in detachment, or a dulling of conscience. As a remedy, Goodpaster (2007) argued for the development of conscience, involving the formation of good habits through application of certain underlying tenets of classical moral theory. This can guide individuals as they attempt to navigate and balance their own goals with the goals of their broader human communities. Building upon Catholic social thought, Bernacchio (2019) elaborated the importance of processes such as discernment in helping leaders foster the gradual development of principled moral action among employees. Understanding the personal

context and challenges faced by employees who are attempting to exercise conscience is seen as central to the task of helping employees form conscience.

### **Conscience in Business and Organizations: Themes**

Several themes emerge in relation to conscience in organizations. These include discussions of whether corporate level conscience can exist; the nature of corporate conscience; questions of whether corporate conscience should exist; and ethical issues associated with employee or corporate level conscientious objection in relation to specific work requirements. Consider each of these, in turn.

### **Can Corporate Conscience Exist?**

Corporations exist as artificial entities created in law. Although often anthropomorphized, corporations, as artificial entities, do not experience nor demonstrate aspects of conscience as conventionally understood. For example, unlike natural persons, corporations do not experience consciousness about their own actions in situations, nor do they experience disquieting emotions in response to decisions that are inconsistent with deeply held values.

However, despite their existence as artificial entities, it is often argued that corporations can have a conscience, as that which might reside in their membership. For example, the conscience of the founder or other influential leader might be projected onto (Goodpaster and Matthews 1982) and serve as the conscience for the organization (Blythe 2014). Members fulfilling particular roles such as public relations or HR are often seen as uniquely trained to consider human or public interest and therefore identified as those who could or should serve as the conscience for the corporation (St. John III and Pearson 2016). Conscience might also be created through the articulation, modeling, diffusion, and cultivation of certain values or moral principles throughout the entire organization. However, this would necessitate not simply an employee information

session but rather, meaningful opportunities, processes, and support for employee development and implementation of various, nuanced capacities that would foster the exercise of right conscience (Bernacchio 2019).

## What Is Corporate Level Conscience?

As alluded above, several conceptualizations construe corporate conscience as originating or residing within a primary and single corporate source (e.g., founder, influential leader, and department manager), to which others might also be held accountable. However, recent discussions reflect relational perspectives on corporate conscience.

Relational perspectives on corporate conscience reject reliance on a primary and single source or authority from which corporate moral values are enacted or diffused (Rojas 2019; St. John III and Pearson 2016). They also reject the view that the role of corporate conscience ought to be limited simply to maintaining corporate integrity, or the integration of corporate actions with a set of corporate values or moral principles (which might or might not be good values or principles). Rather, relational perspectives construe corporate conscience as a disciplined, proactive process of engaged dialogue, enacted throughout a web of interconnected stakeholders, both internal and external to the corporation (Rojas 2019; St. John III and Pearson 2016). Formal and informal dialogue with diverse stakeholders who might hold opposing views inspires corporate leaders toward effortful reflection upon values such as human dignity and social justice. Creative problem-solving can lead to generative opportunities and solutions for all.

## Should Corporations Have a Conscience?

Kenneth E. Goodpaster and John B. Matthews, Jr. (1982) acknowledged that individual values can be projected onto corporations but asked whether this should occur. Specifically, Adam Smith's invisible hand argument and John

Kenneth Galbraith's hand of government argument both suggest that corporations need only act responsibly within the systems of laws, rules, and incentives within which they exist. Invisible market forces, or visible government interventions, respectively, will shape the moral character of corporations, and corporations ought not to intervene in these processes through attempts to impose additional moral constraints. Goodpaster and Matthews (1982) challenged certain assumptions inhering these frameworks and deconstructed flawed objections to their alternative "hand of management" argument, which promoted agent (versus rule or system)-centered forms of organizational responsibility, characterized by rationality in moral decision-making and respect for diverse and underrepresented stakeholders as ends rather than means.

## Individual Level (Employee) Assertions of Conscientious Objection

Early research on conscience in organizations considered issues of work-related conscientious objection in which individuals make prospective claims that they are unable or unwilling to complete certain work tasks because doing so would contravene their own internal moral standards, thereby harming their personal integrity and wellness. Conscientious objection is an important area, because freedom of conscience is a fundamental value in many cultures (Von Bergen 2009).

Common examples of conscientious objection have been those occurring in health care in relation to provision of reproductive or assisted dying health services, and in military service in relation to taking human lives. However, a growing trend has been the expansion of conscientious objection, often on religious grounds, beyond such settings into other contexts, and the perception by workers that they should be protected in exercises of conscience that diverge from work demands. Examples have included objection against participating in the production of items perceived to promote violence or to be used for violent purposes; objection against work-related contact with alcohol or with other organizations

that condone alcohol use; and objection against having to sell (i.e., scan at a checkout) certain foods at grocery stores (Von Bergen 2009).

Various researchers have argued that decisions about whether conscientious objections ought to be upheld should be evaluated based upon several factors. Examples have included the centrality of the values upon which the objections are based to the individual's personal identity; the degree of commitment the individual has shown to these values; or the potential for negative personal impacts should individuals be required to engage in the actions against which they conscientiously object (Baylis 2015).

Other scholars have rebuffed the assertion that the purpose of conscientious action ought only to be that of facilitating personal moral integrity in which individuals integrate their actions with their personal values and beliefs (Baylis 2015). For example, what if the personal values with which individuals seek to integrate their actions are ethically concerning? Similarly, what if individuals asserted conscientious objection in the absence of reflective consideration of others, or at substantial costs to others? Instead, relational orientations comprising engaged, effortful dialogue with interconnected stakeholders, including those who might hold opposing views, are recommended, as this might facilitate creative, dignifying responses to what might seem like disparate underlying needs (Baylis 2015; Rojas 2019).

### Corporate Level Assertions of Conscientious Objection

The owners of corporations have also made conscientious objections on behalf of corporate entities. For example, in the widely noted 2014 US Supreme Court case *Burwell v. Hobby Lobby, Inc.*, the Court allowed the for-profit, but closely held, company Hobby Lobby to exclude certain contraceptives from employee benefits on religious grounds, even though provision would normally be required under the US Affordable Care Act. This outcome raised a number of ethical questions among scholars, including what the Court's decision might foreshadow in terms of varied religious

rights being granted to publicly traded (versus closely held) companies, and whether additional rights such as voting rights might similarly be conferred upon artificially created corporations.

In an incisive analysis of the ethical issues raised by various scholars, Amy J. Sepinwall (2015) argued that certain rights to religious freedom should be given to corporations only under two conditions. These include situations in which the controlling members agree on the exercise of a particular right, and only when these corporate rights are needed to fully uphold the religious freedom rights of the controlling members (not only in personal or family life but also in professional life). Although these two conditions might be met in closely held versus publicly traded corporations in relation to religious values, other rights, such as voting rights, are ones that can be fully exercised by individuals and hence need not be upheld in the corporate context. Sepinwall (2015) also identified that the costs associated with reduced contraceptive benefits should not become the responsibility of the employees, but rather the government, which both mandates the provision of these benefits through the Affordable Care Act and simultaneously upholds the human rights of business owners.

## Contract Theory

Ben Wempe  
Rotterdam School of Management, Erasmus  
University Rotterdam,  
Rotterdam, The Netherlands

## Synonyms

Contractarian business ethics; Contractarian justice; Contractarianism; Contractualism; Social contract theory

## Definition/Introduction

Contract theory refers to a model of reasoning in political theory and in ethics more generally in terms of which authors aim to demonstrate the normative validity of a rule, principle, or institution, thereby making it plausible to a certain audience. In political theory these principles and institutions are often the authority of government, law, and other main social institutions. The

contract model then provides a solution to the problem of “political obligation,” i.e., it gives an answer to the question “why should we obey government and the law?” In ethics the contract metaphor is used to provide a justification for the system of norms as a whole.

The core of the contract model is the idea that such a norm or institution binds a certain target group or audience addressed if it can be shown that under certain carefully specified conditions, individual members of this audience *would agree* with the norm or institution. A primary characteristic of contract theory, therefore, is the individual perspective from which the justification proceeds. As Sugden (2018: 37–48) has recently reminded us, the contract model properly so-called consists of “a recommendation to a set of individuals, showing those individuals how they can coordinate their behaviour to achieve mutual benefit.” A well-formed contract argument therefore proceeds from the standpoint of “a mediator, helping the parties to a negotiation to find an agreement that they can recognize as mutually beneficial.” In contrast to a counselor advising separate individual parties, “the contractarian mediator is advising all the parties together.” At the same time, since the recommendation is addressed to each member of the community individually, its contents must be coached in terms which all parties can acknowledge. Following from these basic characteristics of contract theory is the idea of compensation, which links contract theory to the perspectives of rational choice and cost-benefit analysis (CBA) (“Rational Choice and Cost-Benefit Analysis (CBA)”). If “a specific policy proposal would impose harm on particular individuals, the addition of compensation payments may make the overall proposal mutually beneficial.” Another central corollary is that contract theory is logically incompatible with all forms of paternalism. Seen from a contractarian perspective, “a paternalistic recommendation *lacks a valid addressee*.”

In view of the modeling involved, the contract argument typically runs in terms of hypothetical, as opposed to actual, agreement. Since the work of Scanlon (1998), the standard distinction of contract theory is into *contractarianism*, building on the Hobbesian perspective of mutual

advantage, and *contractualism*, which goes back to Rousseau's notion of free and equal citizens and Kant's idea of rational autonomous agency.

## The History of the Social Contract Argument

The social contract model can boast a long tradition in political theorizing in which the model grew fashionable at certain times in order to disappear from view again for longer periods of time. In book II of his dialogue *Politeia*, which was set in Athens in 411 BC, Plato invokes a social contract account of the origin of society based on increasing specialization in the production of goods which in turn extended human needs and increased interdependencies. Plato then contrasts this starting point against his own blueprint for an ideal state. In the Middle Ages, at the time of the Investiture Controversy, when Pope Gregory VII quarreled with Emperor Henry IV over the right to appoint bishops, the Alsatian monk Manegold von Lautenbach invoked the contract model to secure the prerogative of his boss.

The social contract model took a very large flight especially during the period of the religious wars in England in the seventeenth century. In particular, the tightly reasoned contract model of Thomas Hobbes (1588–1679) contributed a lot to the popularity of the theory. Hobbes' framing proceeded on the thought experiment of a "Natural Condition of Mankind" in which there is no "common power to keep them all in awe." Hobbes (1651/1968: 189–217) recognized nineteen "natural laws" that are supposed to lead the behavior of people in the natural condition. For example, on the basis of the first law of nature: "every man, ought to endeavour Peace, as farre as he has hope of obtaining it; and when he cannot obtain it, that he may seek, and use, all helps, and advantages of Warre." The second law of nature tells us "That a man be willing, when others are so too, as farre-forth, as for Peace, and defense of himselfe he shall think it necessary, to lay down this right to all things; and be contented with so much liberty against other men, as he would allow other men against himselfe." These various laws

of nature specify to each individual how it would be in her rational self-interest to fulfill the terms of any contract she has made, provided she has sufficient assurance that the other party to the contract will perform too.

Given the motivation of individual citizens in the state of nature, everyone will continuously seek to neutralize other individuals in society by way of precautionary measure. In these circumstances, life would inevitably be "solitary, poor, nasty, brutish, and short," as one of the most famous phrases in his book *Leviathan* (1651) was formulated. Given Hobbes' modeling there was only one possible option for rational individuals to secure themselves against this omnipresent threat and that was by transferring all authority to a "sovereign representative" of the Commonwealth which was to be constituted by such a contract. Hobbes' version of the social contract argument works as an "alienation contract," i.e., "the position that the ruler is instituted when the people surrender their power to him" (Hampton 1986: 3). The paradox of Hobbes' analysis, of course, was that it could be used to support both the absolute regime of Charles I and the authority of Cromwell, once he had taken power and Charles was beheaded.

In the hands of John Locke (1632–1704), the social contract argument takes on a very different meaning. Locke's account of natural law gives a much more rosy picture of the state of nature. In his version of the model, the argument to consent to the establishment of a civil government is more like an unfortunate side effect of the dynamics between individuals in the state of nature. The problem that Locke outlines is basically the problem of a judge in his own case. Because everyone acts as the executor of the law of nature, people easily yield to the temptation to overcompensate. This is essentially the same mechanism that some scholars of international relations invoke to explain the nuclear arms race. Eventually, the reason why Locke thinks it is rational to agree with the institution of a civil government is therefore a pragmatic one. Civil strife is actually a by-product of how individuals interact under state of nature conditions, and it does not at all resemble the grim image

of Hobbes. Locke's version of the social contract argument is the classical version of an "agency" contract, i.e., "the position that the ruler's power is only loaned to him" (Hampton 1986: 3). This particular rendering of the argument much better fits Locke's objective, justifying the resistance against the reign of King James II regime and with the justification of the Glorious Revolution in 1688, in which the Dutch Stadholder William III and his wife Mary (who was James' daughter) took over the throne.

Jean-Jacques Rousseau (1712–1778) developed two separate variants of the social contract model. In his entry for the Academy of Dijon essay competition, the social contract appears as a clever intrigue of the rich against the poor. And although the smartest among the poor saw through this trick, they also realized that there ultimately was no alternative but to agree to the terms of the contract, because people had grown so dependent on each other that they could no longer return to the idyllic natural state. Although *Du Contrat Social*, Rousseau's most famous book in political theory, bears the name in its very title, his second version of the social contract deviates in an important respect from the standard model based on consent with the establishment of government by rational individuals in the state of nature as developed by Hobbes and Locke. Instead of individual consent, Rousseau introduces the idea of a general will that must be presupposed in order to conceive of a society in the first place. Rousseau is not clear about the origins of this notion, but the main line of his political theory amounts to realizing that the sum of all individual wills (to which he refers as *volonté de tous*) should be made to coincide in such a (*volonté générale*). Rousseau's innovation of the social contract model is further elaborated in the philosophy of Immanuel Kant (1724–1804) in which the idea of a social contract emerges as a hypothetical "idea of reason" forming part of the structure of the practical reason. "This idea . . . can oblige every legislator to frame his laws in such a way that they could have been produced by the united will of a whole nation," and obligate each citizen "as if he had consented" (Kant 1793/1991: 79).

## Contemporary Applications of the Social Contract

### Political Contract Theory

Since the culmination point of the classic social contract tradition in Continental Europe in the seventeenth and eighteenth centuries, the model effectively fell into oblivion until it was revived in the second half of the twentieth century in the work of John Rawls (1921–2002). With this author the application context of contract theory shifts from a substantiation of the authority of the state, the law, and the issue of "political obligation" to the problem of "distributive justice." The question is no longer why people would in fact have reason to obey the law, but how society could be organized in such a way that the surplus yield of joint lusts (and the necessary burdens) that arise from society can be divided fairly. Rawls only looks at society in its main outlines: his justification of the existing system in Western liberal democracy focuses on the "basic structure of society," by which he thinks of the main institutions such as basic liberties, competitive markets, private property, and the monogamous family. The core function of the "state of nature" thought experiment in the classic social contract tradition is substituted by the idea of an "original position" in which contractors deliberate on the principles on the basis of which a just society can be organized, while all relevant information, which would render partial their deliberations, is kept away from them behind a "veil of ignorance."

Rawls' influential social contract model prompted two broad lines of criticism. In the 1970s, Robert Nozick (1938–2002) developed a theory in which, based on the idea of the state of nature, the social contract served to justify a minimal state, but none of the extensive provisions of the modern welfare state which Rawls' model recommended. Nozick's interpretation of the state of nature formed the basis for a flourishing tradition of libertarian political theory that encompassed both a right-wing and a left-wing variant. In the 1980s, Rawls' project for a comprehensive social contract was criticized by Michael Walzer (1983) and a number of other

“communitarian critics” who sought to replace the individual starting point of the social contract argumentation with a model whereby individuals are conceived as beings which can only flourish as part of greater social bandages. There is no single overarching conception of justice that applies to all social domains. Instead, we should think of society as organized into different *Spheres of Justice*, such as education, medical care, office, free time, love, and divine grace, each of which has its own standards of justice.

Under the influence of his communitarian critics, Rawls saw fit to substantially revise his theory in the course of a number of articles that were eventually bundled in his book *Political Liberalism* (1996). The original (1971) version of his social contract model was based on a methodology of “wide reflective equilibrium” and assumed a full and uniform consensus shared by all the participants to the social contract. The (1996) revision of his work relaxed this to the methodology of “overlapping consensus.” This is “a consensus that includes all the opposing philosophical and religious doctrines likely to persist and to gain adherents in a more or less just constitutional democratic society” (Rawls 1985/1999: 390). In this line of thought, the existing order can also be legitimized by a conclusion shared by different participants for different reasons. Only in this way does Rawls consider it possible to arrive at a stable “conception of justice.”

Further elaborations of political contract theory were developed by Habermas (1981) and Akkerman (1980). According to Habermas, the best basic structure consists of an arrangement that is endorsed by participants in a collective debate under ideal speech conditions. That generally comes down to conditions of equality where everyone has the opportunity to participate in the debate and where everyone can question the claims of others. Habermas argues that it is not pragmatically possible to refer to reasons that serve only one’s own interests in such a public-oriented discussion. In this way he trusts that a basic structure will be chosen that best serves the public interest. In Akkerman’s variant of the model, the best basic structure is the arrangement

that is established in a dialogue that meets the neutrality condition. This means that no one can claim that her conception of the good is better than any other conception nor that she is intrinsically superior to any of her fellows.

### Moral Contract Theory

As mentioned, the contract metaphor is also used to provide the broader field of ethics with a normative foundation. Gauthier (1986) starts from the idea of mutual advantage and sets morality against the operation of the perfectly competitive market. Where interactions between people can be steered through market transactions, there is no need, not even room, for morality. According to Gauthier, the market is a “morally free zone.” But wherever the market fails, we do need moral rules. What these rules should look like is determined in Gauthier’s project on the basis of a contract between rational agents who have to adhere to the principles of “minimax relative concession” and “constrained maximization” (ibid.: 141–189). There is also a natural baseline to these controlled negotiations, for which Gauthier reverts to a clause from Locke’s theory of acquisition under the Law of Nature, the so-called proviso: everyone is free to arrange everything with each other as long as “enough and as good” quality resources remain for others to exploit (ibid.: 192). Finally, there is the idea of an Archimedean point. Just as Archimedes was looking for a sufficiently long lever and a place at a sufficient distance from the earth to be able to lift it, Gauthier argues that the form and content of moral rules must be generalizable in such a way that they can apply as moral rules for everyone.

Under the heading of *contractualism*, Scanlon (1998) develops a method to give substance to the idea of what he calls “the morality of right and wrong.” This is the whole set of value judgments that can turn out to be right or wrong. There is a certain delineated field of moral considerations that not only reflect values but also create obligations. *What We Owe to Each Other* develops a methodology based on the idea of “reasonable rejectability”: you can keep people to commitments if these cannot be rejected on reasonable

grounds. An example of a norm open to reasonable rejectability would be a principle requiring strict neutrality between friends and strangers. Such a principle can very well be rejected because it is incompatible with the attitudes and values of friendship (ibid.: 219). An example of a norm that cannot reasonably be rejected is the rescue principle: “If you are presented with a situation in which you can prevent something very bad from happening . . . by making a slight (or even moderate) sacrifice, then it would be wrong not to do so” (ibid.: 224).

### Contractarian Business Ethics

In addition to political theory and ethics, the social contract model has also been used for the more applied analysis in business management issues. In their project for an Integrative Social Contracts Theory (ISCT), Donaldson and Dunfee’s (1999) aim is to apply the contractarian perspective in the development of specific norms for economic morality. The idea of an “integrated” model in the title refers to the need to reconcile two levels at which social contracts operate. At the micro-social level, all kinds of norms originate from consent within a certain community. This includes profession-specific standards within individual sectors such as education, healthcare, the legal profession, retail, or the social cultural sector. Another category of micro-social norms consists of business links between different national states and instances of foreign direct investment. Where standards will presumably work well within sectors and national economies, they may easily conflict with each other if they are used between sectors and beyond national borders. Donaldson and Dunfee aim to resolve these kinds of conflicts by means of a macro-social contract. Two main devices of this contract are hypernorms and priority norms. Examples of practices that can be rejected using these hypernorms and priority rules are international bribery, gender discrimination, and workplace safety. In these cases, the authors argue, hypernorms will overrule possible local micro-social contracts warranting these practices.

By way of a final observation, contract theory “appeals to people who take an outsider’s view

of politics, thinking of public decision-makers as agents and themselves as principals. [This kind of people] does not think that he has been unjustly *excluded* from public decision-making or debate; he is more likely to say that he has (what for him are) more important things to do with his time” (Sugden 2018: 52).

## Core Values

Elizabeth C. Ravlin and Xing Liu  
 Darla Moore School of Business, University of  
 South Carolina, Columbia, SC, USA

### Synonyms

Ethical beliefs; Individual, social and moral norms

### Introduction

Core values are fundamental belief systems of individuals, teams, organizations, and societies that convey how these entities should conduct themselves, and indicate their preferences regarding outcomes they would like to obtain. At any level, these beliefs act to mold perceptions, attitudes, and affect, and guide motivation and behavior. A particularly important influence of value systems occurs in the process of making decisions with ethical implications.

### Values at the Individual Level

At the individual level, people hold core beliefs about how they ought to behave in various life domains (e.g., being benevolent toward others; working to achieve a goal, acting with integrity). They also express values in regard to their preferences as to what they will receive (e.g., a stimulating life, a challenging job). Values are considered to be important cognitions within the self-concept, providing guidance as to generalized modes of conduct, and forming a primary component of identity, the *ought* self, whereas preferences are beliefs about what one wants – part of

the *ideal* self. These dual aspects of values are related, such that cognitions about what one should do influence one's ideal-self preferences, and these preferences can affect beliefs about the ought self. Because identity-related beliefs are some of the most deeply held of cognitions, values tend to be stable and significantly mold other cognitions, motivations, and behaviors across situations. Therefore, values are not merely evaluative, attitudinal, or affective reactions; they are central elements of one's identity, and as such, provide organization for these other identity elements. One's conceptions of fact are also shaped by one's system of values, for example, the belief that jobs requiring higher skill levels must command more compensation.

Many scholars (e.g., Schwartz 1992) conceptualize values as responses to basic human needs: biological imperatives and requirements for functional social interaction and the survival of higher-level aggregates such as groups and organizations. Values are strongly socially desirable because they are developed as potential solutions to universal social issues. This means that most individuals will endorse the importance of value-related statements. Therefore, to better understand how individuals make choices between behaviors that represent different values, most researchers conceptualize individual work value systems as structured based on the extent of their impact on evaluations of objects, events, and behavior at work (Meglino and Ravlin 1998), although others have disagreed with such a ranking approach. Despite learning as children that one should always be honest or do one's best work, as individuals mature, these all-or-nothing beliefs become integrated as a value system. Decision situations often require the choice of one value-relevant behavior over another when they conflict; but over time, or in decisions with potentially complex responses, individuals may attempt to satisfy multiple values in their actions.

Values are inculcated at very early ages within families or other childhood socialization settings. Therefore, differences in core values are evident based on the societal culture that has developed over the history of particular nations or regions. However, general clusters of values are associated with universal issues human societies must

address. These include (1) how the individual relates to the collective; (2) the extent to which hierarchical differences are endorsed to maintain order; and (3) how the social world relates to the natural world (control orientation versus adaptation). As such, a relatively small number of values generalize across societal cultures, and thus enhance our understanding of differences in cognition, attitudes, affect, and behavior across the world.

Schwartz's (1992) research identifies 10 types of values in a broad variety of societal cultures: tradition, conformity, security, power, achievement, hedonism, stimulation, self-direction, universalism, and benevolence. These values have consistent relationships with one another, such that when an individual acts, or fails to act, on a specific value, other values are impacted as well. This is consistent with our understanding of values as a set of cognitively networked congruent or conflicting self-beliefs. This body of research indicates that specific pairs of values foster the fulfillment of each other (e.g., power and achievement, hedonism and stimulation, tradition and conformity). Further, two fundamental categorical conflicts are evident. First, certain values demonstrate openness to change (stimulation and self-direction) versus conservation (security, conformity, tradition). Second, self-transcendence (universalism, benevolence) conflicts with self-enhancement (achievement, hedonism, and power). Note that these conflicts are not inconsistent with the socially desirable nature of all values; rather, they imply the difficulty of enacting all values that one might endorse in one situation.

In addition to familial and cultural contexts, individuals learn core values from other societal institutions (economic, educational, and political). Factors such as personality, cognitive moral development, and other individual differences also have implications for an individual's value system. For example, values and personality are correlated, but both explain unique variance in occupational preferences. Because of their early socialization and social desirability, and relationships to such stable factors as culture and personality, values tend not to change much during adulthood. The lifecycle stage when they are

most subject to change is young adulthood, the phase in which individuals are most likely to experience significant new challenges and circumstances (18–22 years old). Such a shift is likely to require alterations in significant portions of the self-schema, encompassing related cognitive and affective elements. Studies over several years tend to agree that values are characterized by stability, but that there are some life cycle changes. Extrinsic and status-oriented values, in particular, have been noted to increase over the life span.

Direct conflict between values may produce a change in value rankings, and over time, individuals may find it easier to violate a value having violated it once, until ultimately it loses some of its importance. Because values are expected to function to help meet basic needs, repeated failures of a value-related behavior to help in this regard may also lead to systemic changes over time. Such processes may explain long-term, context-independent value changes in adults, although these are less likely to be observed. When the social environment in which individuals are embedded is altered, for example, through technological or financial shifts, value structures may evolve quickly, although these shifts may be temporary or liminal phases demarcated by more stable, and possibly more similar, periods. Recent scholarship has also investigated how one's cultural values may change through immigration, noting that length of time and amount of education in the new culture, and frequency of contact with locals, are important factors in how much change occurs. Even after two decades, however, acculturation is not complete (Taras et al. 2013).

**Work Values.** In the specific domain of work and organizations, work values have been studied extensively in terms of their content, acquisition, and change. They are often categorized in four commonly identified types: (1) extrinsic or instrumental values (bestowed by others; pay raise, bonus), (2) intrinsic or cognitive values (experienced internally; challenge, development), (3) relational or social values (respectful and/or friendship relationships between coworkers), and (4) power or self-enhancement values (gaining authority or status). Work values may be

considered to be context-specific manifestations of general life values; however, they may also shape life values in other life domains over time. Although some authors have argued for a compensatory approach in which people satisfy different values in different areas of their lives (e.g., achievement in work roles, concern for others in community roles), this idea has received limited research support. Instead, evidence tends to support the spillover of values between work and other life domains. This is consistent with the view that values are an important part of one's self-oriented beliefs, which would suggest some coherence across different contexts and role identities.

The cultural patterns described above are pervasive in the manifestation of work values because they indicate desirable ways of solving organizational problems, such as how order will be maintained. If a society endorses hierarchical means of control, power and self-enhancement work values will dominate, likely at the expense of egalitarianism and harmony (cultural values) and an emphasis on relationships (work values). In the workplace, interpersonal processes central to organizational effectiveness, such as communication, conflict resolution, and status organizing processes, have all been shown to be subject to cultural value differences.

A frequently expressed concern in recent years has been that in the United States and some other developed countries, a desire for increased balance of work and nonwork values is eroding work ethic (achievement) values. One potential cause for this shift may be that achievement-related behaviors, or lack thereof, are no longer as likely to significantly change one's socioeconomic status and the lifestyle one can afford as they may have been in the prior century. Research supports the existence of generational differences in work values. Specifically, nonwork values are of more, and work values of less, centrality to younger generations. Other-oriented (e.g., helping) work values, however, do not appear to differ.

**Effects of Work Values.** Although in some instances espoused values can be argued to be a product of behavior when they are used to

legitimize actions that have already been taken, research clearly shows individuals' work values mold perceptions and interpretations of events in the work environment, particularly in ambiguous or uncertain contexts. Further, values influence goals, which in turn lead to effortful behavior. In addition to the mediating role of goals, the extent to which one has discretion over action, and identifying an action as value-related, influences whether values will predict behavior in any given situation. As such, work values are motivators in that they indicate which pathways are ideally more attractive than others based on whether the action itself is valued, or because the action is associated with a valued object, goal, or event. The values of managers and coworkers have also been shown to shape individuals' motivation (e.g., toward safety behaviors), and work values also predict the development of relationships with coworkers.

Research examining specific values has noted some interesting effects. Individual values related to openness to change are significantly predictive of the choice to become an entrepreneur, but only when societal values do not support entrepreneurial behavior. In addition, findings show that those who place more importance on intrinsic values are more likely to report higher person-organization fit two years later, whereas those who emphasize extrinsic values are less likely to be unemployed. Ethical decisions in the work environment are also related to individuals' values. For instance, a dominant honesty orientation produces more ethical actions. Individuals' green (environmental) values have significant impact on their green (environmentally friendly) behaviors, and recent research shows that individual green values enhance the effect of organizational green human resource practices on both employees' in-role and extra-role behaviors. Additionally, social value orientation (pro-social versus self-oriented) has been studied as a predictor of cooperative behavior in cooperative tasks or social dilemma situations. These relationships between values and behavior are often small at any one point in time but are stronger when examined over time, as with other individual differences.

## Values at the Organizational Level

Organizational values are a fundamental component of the organization's culture, in addition to underlying assumptions and normative practices. These values are most often explicitly articulated by and disseminated from the organization's leadership, and are influenced by the competitive environment and other industry-specific qualities. An influential framework for understanding organizational culture and its effects is Quinn and colleagues' Competing Values Framework (Quinn and Rohrbaugh 1983). This approach utilizes two dimensions, control versus flexibility and internal versus external focus, to describe a range of effects. For example, organizations focused on external values and a control orientation are characterized by efficiency, planning, and goal setting. Organizations with an internal focus and a flexible orientation are likely to emphasize human resources development, morale, and cohesion. Recent research has shown that organization values differ across organizational types (e.g., for profit, not-for-profit, government), and stakeholder cultures have also been identified, with emphases ranging from self-interest to concern for all stakeholders.

Organizations socialize employees to understand, accept, and internalize their desired work values, and this process is an important source of change for individual values. Formal socialization processes, myths, stories, and their repetition are used to inculcate the organization's preferred values. Martin (2016) provides data on the effectiveness of narratives in this context based on values violation and the central actor in the story. Compared to stories centered on high-level actors, stories of lower-level actors acting in value-consistent ways led to newcomer self-transcendent (other-oriented) behaviors and reduced deviance. Stories featuring high-level actors, as opposed to lower-level employees, who violate organization values negatively related to both newcomer self-transcendence and deviance. For an individual to internalize organizational values, these values must be functional for the individual, or appear to be the only available path for behavior. Stated or espoused values may

produce transitory changes in behavior; however, if organizations do not support them in more tangible ways, these changes will dissipate. In such situations, employees may come to espouse these values (as does upper management), but recognize there is no need to enact them. When significant numbers of employees enter the organization at the same time, or when top management is replaced, these newcomers may have significant influences on organization values, as opposed to being socialized by the organization.

## Value Sharing

Value congruence refers to the alignment between employees' values and those of their supervisor or organization, and is therefore *supplementary*, as opposed to *complementary*, in nature; that is, similarity is its basis. Value congruence is generally considered beneficial for employees. It enhances employees' trust in their organization and their communication with others, leading to higher job satisfaction and commitment, and lower turnover intentions. Recent research shows that employees' value congruence with their organization is the key for human resource management effectiveness in retaining employees. Additionally, value congruence between employees and their leader fosters employees' identification with the leader.

The underlying mechanism of such positive influences of value congruence on employees' attitudes and behaviors is argued to be that value congruence satisfies one or more of a person's fundamental psychological needs, such as a desire for belongingness, or having discretion over one's actions. When employees experience value congruence with their organization, they feel that their identity matches their organizations' expectations of them, leading to a reinforcement or verification of their desired self-image. As a result, value congruence motivates employees to engage in their jobs and leads to increased task performance and citizenship behavior.

Recent research has refined our knowledge of value congruence by exploring the importance of the type and direction of congruence, and also

which value alignments may matter most. The majority of value congruence research is founded on the conceptualization of values as beliefs about how individuals should behave (i.e., *ideal value congruence*). This focus is consistent with an emphasis on individuals' approach or promotion motivation. However, congruence may also exist between employees and their organization concerning what they desire to avoid (i.e., *counter-ideal value congruence*; prevention motivation focus). Researchers have found that counter-ideal value congruence is positively related to employees' trust in their organization even when controlling for ideal value congruence. Congruence can also exist for either "high-high" or "low-low" shared value situations. For instance, value congruence that exists between employees and organizations who both have high concerns for the environment has greater influence on employees' job satisfaction and creativity than congruence that exists between employees and organizations who both have low concerns for the environment. In addition, recent scholarship has found that the effects of value congruence may be limited to certain values. For example, value congruence has been found to only benefit commitment when the values alignment concerns organizational performance expectations for employees.

Value incongruence has generally been viewed as detrimental for employees. The underlying reasoning for this is that the mismatch between employees' values and those of their organization may diminish employees' ability to fulfill their fundamental psychological needs and inflict harm on their self-esteem. Individuals feel that they are not able to enact their true identity as they attempt to meet the organization's expectations and that, therefore, their work is not meaningful. This lack of alignment may lead to ego depletion, the effects of which are independent of attitudes (job satisfaction) that may mediate the relationship between value congruence and performance. As such, employees experiencing value incongruence will not be satisfied or fully engaged in their jobs and may suffer from burnout, leading to increased intention to leave the organization and diminished job performance. These findings

are based on the assumption that employees are not able to change their situation, and will eventually leave their organization. However, recent research has showed that under some circumstances, employees can cope with and combat value incongruence with their organization through proactive work (i.e., job crafting) and nonwork or leisure behaviors.

Evidence has been very consistent that work value congruence relates to positive attitudes; however, the relationship between value sharing and performance across multiple contexts remains less clear. Congruence within an organization has been argued to create smooth internal processes, as shared mental models of desirable behavior and goals reduce conflict and uncertainty. This argument is consistent with the Attraction–Selection–Attrition approach, which indicates that organizations become more homogeneous as similar job candidates are attracted to, and are likely to be satisfied and stay with, the organization over time. However, consistency between the organization's values and the external environment has been viewed to lead to higher performance; that is, the organization must be mindful of the values of its external stakeholders in order to meet their demands as well. Organizational performance may be enhanced by the positive affect and identification generated by employee value congruence, at least in some situations. However, strong evidence on team composition clearly demonstrates that cognitive heterogeneity contributes to effectiveness in dynamic or creative contexts. The bridge between shared values, which can reduce uncertainty and act as a moral compass for the organization, and constructive differences between task perspectives, remains to be fully articulated.

## Synonyms

Crimes of the powerful; White-collar crime

## Introduction

Messages about the benefits of private enterprise inundate contemporary capitalist society. Corporations encourage us daily to purchase their products or invest in their stocks. Most major companies tout their commitments to social responsibility, declaring their respect for the environment and support of charitable causes. Governments declare that corporations offer much-needed jobs and the most effective and efficient means of accumulating and distributing wealth throughout society. Mainstream media portray “captains of industry” as role models and remind us that consuming products is socially and economically beneficial. It is virtually impossible today to envision a world without corporations;

we are transfixed by dominant beliefs that they are inherently good.

While corporations do generate certain benefits – new technologies, essential medicines, and employment – they also routinely break the law and cause untold harm. On a global scale, corporations annually kill hundreds of thousands of workers, injuring millions more, through unsafe and illegal working conditions; kill and sicken thousands of consumers by producing unsafe pharmaceuticals and other dangerous products; damage and destroy the environment by illegally dumping toxic waste into watercourses and landfills and spewing harmful cocktails of pollutants into the atmosphere; and steal millions of dollars through fraudulent accounting, price-fixing, and illegal insider trading. Far from the preserve of “rogue” or “fly-by-night” organizations, many highly respected companies – so-called industry leaders – are guilty of these offences. What is more, corporations and corporate actors are rarely charged for their crimes, and for the few who are convicted their punishments are rarely severe (Glasbeek 2017). The nature and extent of corporate offending raises vital questions about how best to regulate and control corporations.

Understanding corporate crime in contemporary capitalist society entails some consideration of how we define this phenomenon, including the political-economic influences that shape how we conceptualize and respond to corporate malfeasance. It also involves contemplating whether corporate crime is a result of individual wrongdoing/ethical failures or a by-product of decision-making within corporate capitalism.

## What Is Corporate Crime?

A range of terms have been used over the years to describe crimes committed by corporations and their actors or representatives: white collar crimes, corporate crimes, elite deviance, crimes of the powerful, economic crimes, occupational crimes, and safety crimes. There are generally two categories of corporate crime: financial corporate crime, or activities such as insider trading, fraudulent bookkeeping and price fixing; and social

corporate crime, encompassing offences against the environment (air and water pollution) and occupational health and safety crimes (unsafe and dangerous working conditions).

Important distinctions exist between the different terms used to describe corporate offending. Chief among these is the difference between white-collar and corporate crime. Edwin Sutherland, who pioneered the term white-collar crime in the 1940s, defined this phenomenon as: “crime committed by a person of respectability and high social status in the course of his occupation” (Sutherland 1983: 7). Sutherland challenged the ideologically based notion that crime was a distinctly lower class phenomenon; he argued in reality businessmen and professionals routinely committed serious harm and wrongdoing. Corporate crime scholars argued that Sutherland’s definition anthropomorphized the corporation, meaning that committing an offence was an individual act or choice to transgress the law. These scholars instead directed their attention to the organizational and socioeconomic factors of corporate crime, employing definitions that transcended humanist accounts to conceive corporate offending as a result of “structural irresponsibility” (Tombs and Whyte 2015). From this perspective, the modern corporation’s incessant demand for profit maximization – the corporation as amoral calculator – makes it inherently criminogenic, a situation worsened by the corporation’s legal status as a natural, independent person with limited liability (Glasbeek 2017). This approach does not suggest that individuals are without fault – i.e., some individuals within corporations do make decisions to act unethically and illegally – but that the pressures of profitability influence actions.

### **Neoliberalism and the Corporate Criminal**

Beyond definitional considerations, it is impossible today to understand corporate crime without some reference to neoliberalism. Beginning in the early 1970s, as Western states faced growing fears of stagflation and increased global competition, neoliberal economic reasoning began to dominate

the political and economic landscape, bringing about the death of state socialism. Massive cut-backs to welfare, social services, and post-secondary institutions and a quasi-religious commitment to programs of privatization followed. Corporate leaders argued that laws governing the economic realm were unnecessary, even redundant, because competition through free markets was the best way to separate out irresponsible employers and corrupt practices.

Deregulation of the economic realm became the dominant mantra of the 1980s and 1990s. Fuelled by visions of bureaucratic red tape and rhetoric denouncing the “regulatory burden” imposed on business, Western governments ditched numerous regulations in the name of economic progress, efficiency, and the neoliberal promise of tax cuts. In some arenas, corporate crime disappeared as both a concept and in law, overshadowed by deregulation, downsizing, and claims that supported corporate capitalism. In others, the state did not totally abandon its efforts to regulate business but reconfigured these responsibilities in ways that favored the interests of corporations and the markets.

Myriad consequences followed this shift in public policy toward privatization. In particular, corporations used their newfound freedom to run their businesses in the most efficient way possible, extracting the maximum amount of labor for the minimum amount of pay and exploiting the burgeoning financial markets to the greatest extent possible. Unfortunately, this “freedom” had an ominous downside, evidenced by a seemingly endless list of high profile corporate disasters, including: the 1982 Bhopal chemical disaster that killed thousands instantly and seriously sickened and killed thousands more in the following decade; the sinking of the sea ferry, the *Herald of Free Enterprise*, outside the Belgian port of Zeebrugge in 1987 killing 193 passengers and crew members; the BP oil disaster in the Gulf of Mexico in 2010 that killed 11 workers and destroyed the aquatic environment along the Louisiana coastline; and the 2008 global financial crisis where world GDP declined 6%, \$25 trillion was obliterated overnight, hundreds of thousands of people lost their jobs and pensions, and the

greatest economic downturn since the Great Depression ensued. Neoliberalism has thus profoundly shaped the production of corporate crime in recent decades.

### Globalization

While corporations have long operated globally, the full forces of globalization were only realized in the 1980s and 1990s when trade agreements abolished national protective tariffs and established a truly global economy. Since most laws restricting and regulating corporate operations were (and still are) state based, and many countries in the Global South have inadequate or absent labor, environmental and financial laws, transnational corporations had what amounted to free rein to run their businesses in ways that maximized profits and externalized all environmental, social, and cultural costs. Raymond Michalowski and Ronald Kramer (1987) characterized this situation as transnational corporations exploiting the “space between laws,” relocating their production processes to jurisdictions with less onerous regulations, therein ensuring that “injurious acts” prohibited in their home country went uncensored in the host countries where they operated.

### Corporate Social Responsibility

Alarmed by the growing amount of corporate malfeasance, particularly with respect to transnational corporations operating throughout the Global South, nongovernmental organizations and human rights groups promoted corporate social responsibility (CSR) as a means of conveying what they expected of corporations both normatively and ethically – expectations that extend beyond the incessant drive for maximal profits. Two notable initiatives by the United Nations exemplify these efforts: the Global Compact, developed to promote social responsibility among some of the world’s largest companies; and the UN Special Representative of the Secretary-General (SRSG) on business and human rights, charged in 2005 with identifying and clarifying human rights “standards and practices” for businesses and providing recommendations for their implementation. While proponents applauded these efforts for promoting CSR, critics

worried about their voluntary nature; that without legal obligations empowering authorities to investigate allegations of corporate wrongdoing, issue punishments and/or remedies, and independent verification to ensure that corporations amend their policies and practices accordingly, they were (and are) largely symbolic and toothless responses. In addition, despite positive corporate rhetoric supporting the UN’s work, corporate behavior around the world seems pretty much unchanged.

Beyond the UN’s work stands a plethora of CSR initiatives, including corporate-led social responsibility programs and reports, specialized CSR training and management opportunities, NGO efforts to hold companies to account for their commitments and academic resources. Most major companies now invoke the triple bottom line in reference to their commitments to balancing economic, social, and environmental responsibilities. However, despite lofty claims, the language of CSR – e.g., caring, respect, sustainability – is vague and imprecise, creating a void to be filled by powerful corporate interests. In addition, CSR is an attempt by corporations to avoid formal state intervention or regulations in favor of nonbinding (self-regulatory) codes of conduct, industry standards, and benchmarks. Corporate actors have always quickly and aggressively resisted any CSR proposals that include legislative requirements, helping cement the idea that social responsibility is a voluntary measure. What is more, CSR may simply be another economic “opportunity” for companies to engender consumer loyalty; a form of brand messaging that facilitates corporate expansion into new markets. In the end, despite the extensive literature on CSR, there is virtually no definitive information regarding how it can be realized or its overall efficacy in preventing corporate wrongdoing (Tombs and Whyte 2015: 117–127).

### Reconfiguring State-Corporate Relations

Lurking behind calls for greater CSR is an apparent inability or unwillingness of states to address corporate harm and wrongdoing. The history of capitalism is one in which the interests of states and corporations have frequently (albeit not

necessarily or automatically) converged. Even as states enacted laws aimed at protecting citizens from the abuses of corporate power, governments found it difficult to separate themselves both ideologically and materially from the interests of private enterprise – a truly contradictory position when contemplating measures to discipline corporations.

Ronald Kramer and Raymond Michalowski coined the term state-corporate crime in acknowledgment that states and corporations “intersect” in the production of corporate offending. As Kramer et al. (2002: 166) note:

The theory of state-corporate crime is deeply concerned with the political and economic processes that enable state and corporate managers to pursue plans and policies – often in concert with one another – that result in death, injury, ill health, financial loss, and increasingly in the globalized capitalist economy, cultural destruction, all the while being insulated from the full weight of criminalization for these actions.

The advent of neoliberalism has only deepened and extended this problem. States and corporations are in increasingly “symbiotic relationships” whereby states commit to minimum intervention in a free market economy that is itself deemed to be an inherent social good (Tombs and Whyte 2015). That there are no-go areas for the capitalist state in holding corporations accountable is particularly troublesome because, as several observers have noted, many corporations have become “too big to fail.” This situation unfolded following the 2007/08 financial crisis when world governments bailed out major banks to stave off a global economic meltdown – a crisis facilitated by state failures to regulate the financial sector.

Despite a seemingly endless list of corporate offending since the 1980s, there remains certain optimism within some political and academic circles to stay the course; to work with corporations, inside the confines of capitalism, to convince them, somehow, to respect their legal and social responsibilities.

Critical corporate crime scholars suggest that we need to conceptualize corporate offending as a structural problematic rather than a technical question of the right “tools” for encouraging corporate compliance with the law. A structural

approach would not mean abandoning the idea of regulation altogether – law is an important site of struggle over the meaning of corporate crime and how it should be regulated and controlled – but instead addressing the corporation as an amoral calculator. The corporation is not a “normal” political citizen – it is legally and structurally designed as a device to maximize profit for its owners and investors. Thus, it is rational for it, at times, to behave as an amoral calculator when faced with laws that add to the costs of production. As such, states need to (re)consider developing more robust laws (not voluntary measures) and ensure that they are adequately enforced.

At the same time, a structural approach challenges us to remain vigilant about the limits of law in addressing corporate harm and wrongdoing. After all, the state is a capitalist state, meaning that its interests ultimately lie in mediating class struggles and reinforcing capital’s existence, not with disciplining corporations. We must therefore be prepared to question capitalism’s inherent inequalities by, for instance, exploring transformative ideals through collective action, bringing together the diversity of individuals and groups in society that have experienced corporate capitalism’s profound harms and inequalities (the 99% of us) to struggle for a different, more equitable, and just way of organizing society. Embracing these ideals may be exactly what is required if we want to move beyond the disastrous consequences of neoliberal capitalism.

## Corporate Crisis Management and Business Ethics

Sheldene Simola  
School of Business, Trent University,  
Peterborough, Canada

### Synonyms

Crisis management; Disaster management; Organizational crisis management

### Introduction

The field of modern corporate crisis management was galvanized by tragedies that occurred during the 1980s. These included the September 1982 deaths of seven people in the Chicago, Illinois area following ingestion of Johnson & Johnson's Extra-Strength Tylenol capsules that had been laced with cyanide; and, the January 1986 explosion-related deaths at liftoff of the seven crew members aboard the Space Shuttle Challenger. Analyses of the range of factors that contributed to the Challenger tragedy, and of the very highly regarded, principled management of the Tylenol crisis both instantiated the centrality of ethics to this field.

### Nature of Corporate Crises

The complex nature of corporate crises has posed definitional challenges. However, a number of specific characteristics of corporate crises have been identified (James et al. 2011). These include that crises are unexpected occurrences that involve actual or potential harm to a range of

stakeholders and pose significant risks for the viability or health of the organization. They are dynamic situations in which there is often ambiguity in causes, outcomes, and potential interventions; yet, there is a perception that urgent action relative to a range of stakeholders is required. Therefore, crises push organizations outside of their normal realm of operations.

Though infinite numbers of diverse and even unique crises might emerge, crises can be classified into typologies based on various characteristics. Although these can include content types (e.g., natural disasters, crises of rumor), it is useful to focus typologies on underlying characteristics, such as the underlying responsibility for, or impacts of, the crisis. The use of underlying characteristics has greater potential to categorize crises in parsimonious and otherwise fruitful ways.

### Corporate Crisis Management

Corporate crisis management typically comprises the proactive and systematic implementation of four components (Simola 2014). These include efforts to assess, identify and reduce the risk of potential crises; plan and prepare for potential future crises; manage actual crises in timely ways that limit their negative impacts; and, learn from current crises in order to prevent future occurrences. Consequently, crisis management requires the ability to anticipate and make sense of disruptive processes or events within the dynamics of multiple interacting systems and subsystems both internal and external to the organization. Although the goal of crisis management might be articulated in terms of restoration of, or return to normal precrisis functioning, effective crisis management might ultimately require health-promoting organizational growth and development.

### Relevance of Ethics to Corporate Crisis Management

Ethics are relevant to corporate crisis management in several ways. First, errors in ethical recognition, evaluation, or action might well predispose

organizations to crises; or, precipitate, maintain, or escalate crises. Second, despite the particularities of any given crisis, effective management involves consideration of diverse and potentially conflicting stakeholder values, needs, and goals. Effective management therefore requires ethical deliberation. Third, to the extent to which conscious, rational deliberation is used in decision-making, the focal areas of decision-making (i.e., recognition, evaluation, action) are similar within both ethics and crisis management. Therefore, skills in ethical decision-making and crisis management are mutually fortifying. Related to this, research in behavioral ethics has identified a broad range of individual, group, and organizational level factors that can inhibit effective ethical recognition, evaluation, and action, even below the level of conscious awareness. Given that many of these factors are also relevant for crisis recognition, evaluation, and action, knowledge of behavioral ethics is useful for crisis management (Simola 2014).

### **Research Themes on Ethics in Crisis Management**

Four research themes have emerged at the intersection of ethics and corporate crisis management. These include the ethics and effectiveness of crisis communication strategies; the implications of ethical theories for effective crisis management; the implications of behavioral ethics for effective crisis management; and the development of critical analyses of, and critical approaches to, crisis response.

### **Ethics and Effectiveness of Crisis Communication Strategies**

In terms of the ethicality and effectiveness of communication strategies in corporate crisis management, two interrelated factors have long been identified as crucial. These include the cultivation and use of a values-based approach to establish and maintain positive relationships with stakeholders (versus a narrow shareholder orientation);

and the use of timely, clear, and unbiased communication strategies with respect to causes, responsibility for, and current understanding and management of the crisis.

The pioneering and now classic case studies of the Jack in the Box e-coli and Malden Mills fire crises conducted by Robert R. Ulmer and Timothy L. Sellnow are prominent examples. In recognition of the uncertainty inhering crisis situations, they identified ethical predicaments in the use of ambiguous crisis communications that favored financial over other stakeholders in organizational intentions and motives associated with actions leading to the crisis; organizational interpretation of crisis-related evidence; and locus of responsibility for the crisis (Ulmer and Sellnow 2000). In counterpoint, precrisis and ongoing positive values-based relationships with a range of stakeholders enabled effective crisis management by creating the necessary conditions for the expression and receipt of postcrisis communications that went well beyond legalities and damage control (Ulmer 2001).

More recently, research in corporate crisis communication has begun to consider ethics of justice and care as foundations for effective and ethical communications (Tao and Kim 2017; Xu and Wenqing 2013). This research has built upon preexisting research that considered the implications of ethics of justice and care for effective corporate crisis management (Simola 2003).

### **Implications of Ethical Theories for Effective Crisis Management**

Consideration of the implications of ethical theories for effective crisis management has occurred primarily through analysis of case studies. Though it has sometimes considered virtue ethics approaches, it has focused primarily on ethics of justice and care. Foundational research elucidated the nature of justice and care ethics for the effective management of corporate crises (Simola 2003), as well as the implications of care ethics for the prevention of organizational crises (Simola 2005).

Although ethics of justice and care differ substantially in terms of their characteristics and implications, they also share commonalities that render them useful ethical frameworks in corporate crisis management. In terms of differences, whereas an ethic of justice emphasizes fairness and the transparent use of formal methods to adjudicate objectively between conflicting rights of stakeholders, an ethic of care emphasizes responsiveness to the subjective, concrete experiences, needs, and feelings of those affected (Simola 2003). An ethic of care also indicates the relevance of connection, resistance, and voice for signal detection and uptake of crisis warning signs in the prevention of corporate crises (Simola 2005). In terms of commonalities between ethics of justice and care, in contrast to moral foundations such as loyalty (versus betrayal) or authority (versus subversion) that focus attention *within* a dominant reference group, ethics of justice and care both reflect underlying moral foundations that are *outward-looking*, necessarily involving consideration of other stakeholders, which is a central tenet of effective corporate crisis management. Within this outward focus, care is particularly salient when there is potential or actual occurrence of serious harm to stakeholders, a circumstance that is almost ubiquitous to corporate crises. It is, therefore, perhaps unsurprising that ethics of justice and care have become relatively dominant frameworks through which to evaluate the effectiveness and ethicality of corporate crisis management efforts.

### Implications of Behavioral Ethics for Crisis Management

Since the beginning of the current millennium, behavioral ethics has become an increasingly influential field. Research in this field aims to describe what individuals actually do (rather than what they *should* do) in response to ethical issues. Although it is commonly assumed that individuals typically engage in reflective, rational, effortful reasoning about ethical dilemmas, behavioral ethics recognizes that individuals are much less rational and intentional than assumed.

Rather, individuals frequently engage in reflexive, emotionally laden judgments that occur outside of their conscious awareness. These types of judgments can also be influenced by situational cues, even when these cues exist below the level of conscious awareness. These reflexive, non-conscious modes of processing information can substantially impede ethical recognition, evaluation, and action, as well as recognition, evaluation, and management of corporate crises. Hence, research in behavioral ethics is also highly relevant in relation to corporate crisis management (Simola 2014).

Indeed, research in behavioral business ethics points to a large number of factors that can significantly impede recognition, evaluation, and action in relation to corporate crises (Simola 2014). Examples of these factors include, but are not limited to, the use of probability or cost-benefit scripts that narrow decision-making focus in ways that preclude ethical consideration of crisis impacts on the well-being of stakeholders; and, the use of cognitive heuristics that might lead to underestimation of the likelihood of potential crises. Additional examples include the slippery slope effect in which individuals find it difficult to notice small, gradual deviations away from corporate ethical, legal, or safety norms; uses of language that can obscure the potential risk dimensions of certain situations; and social factors such as groupthink that can preclude fulsome and rational consideration of potential crisis occurrences or crisis management strategies. Recent empirical research has also identified the occurrence of immoral entrenchment through which corporations demonstrate unethical rather than ethical crisis behavior under conditions of moral intensity (Eleazar 2021).

### Critical Management Analyses of Crisis Response

An important area of research that will likely continue to grow is the critical analysis of the degree to which crisis management demonstrates social justice, and the elucidation of critical approaches in support of social justice (Branicki

2020). This would include analysis of crisis management efforts, which regardless of intent, differentially advantage some groups while disadvantaging other groups who are already systemically marginalized because of factors such as racialization, gender bias, or classism. Public sector examples of this might include the North American nonresponse to the emergence of the AIDS crisis in the early 1980s that led many to question whether a more robust response would have occurred if AIDS had not been perceived as a disease affecting men with same sex orientations. Similarly, many have identified the disproportionate occurrence or negative impacts of natural disasters, unsafe work environments, water contamination, and dumping of toxic waste on communities that are already racialized. Additionally, the COVID-19 pandemic has demonstrated a disproportionate distribution of risks and burdens on workers, often differentially negatively affecting those groups already devalued through lower pay or marginalized job roles in service industries or care settings (Branicki 2020). Therefore, the development and use of critical approaches to crisis management is crucial.

## Corporate Ethics Officers

Henry Adobor

Department of Strategy and Entrepreneurship,  
School of Business, Quinnipiac University,  
Hamden, CT, USA

## Synonyms

Director of integrity; Ethical leader

## Organizational Ethics and Contemporary Business

More and more firms are now creating the position of Chief Ethics Officer (EO) as part of their overall ethical governance program. In the USA, the advent of the Federal Sentencing Guidelines in 1991, the Sarbanes-Oxley Act (SOX), and the well-publicized corporate scandals that precipitated these legislations seemed to have provided the impetus for corporations to create the office of the ethics officer. The Sentencing Guidelines

stated that companies with effective compliance and ethics programs, including the position of ethics officer, could receive preferential treatment during prosecutions for white-collar crimes.

Organizations themselves may be showing greater sensitivity to ethical issues, and corporate boards of directors no longer tolerate even minor lapses. For example, RadioShack fired its CEO for lying on his resume. Hewlett-Packard Chairwoman Patricia Dunn lost her job after hiring private investigators to find leakers on HP's board and it all happened under the watch of Kevin Hunsaker, HP's senior counsel and chief ethics officer (Clark 2006). Intel CEO Brian Krzanich abruptly resigned after what the tech firm described as a "past consensual relationship" with a company employee, and Best Buy CEO Brian Dunn resigned in April 2012 following an investigation into an alleged close personal relationship with a female employee, to name a few (McCoy 2018).

The recognition and attention to ethical issues have not prevented some of the recent cases of ethical violations by firms across the globe. For example, a report in *Forbes Magazine* in October 2017 indicated that Kobe Steel admitted falsifying information on some items the company sold to Boeing, Ford, Toyota, and others since 2007. Car-makers Nissan and Subaru also recalled 1.2 million and 395,000 vehicles, respectively, in 2017, saying they allowed unqualified inspectors to vet their cars in the final checks for decades. In 2017, Wells Fargo admitted that the company had charged as many as 570,000 consumers for auto insurance that they did not need. Perhaps the most notable violation, and most consequential from a financial perspective, was that of Volkswagen. VW admitted that it installed emissions software on more than a half-million diesel cars in the USA – and roughly 10.5 million more worldwide – that allows them to sense the unique parameters of an emissions drive cycle set by the Environmental Protection Agency. This violation cost the firm \$24.17 billion; VW reached a final settlement of \$14.7 billion with the US Government on October 25, 2016, in addition to a \$10 billion buyback program (Shen 2017).

What these examples demonstrate is that there is a greater urgency for organizations to build ethical cultures in which doing the right thing becomes the default choice. Having an ethics officer does not guarantee that organizations will always act morally. However, having a senior level management position in charge of building an ethical infrastructure could be very helpful.

### Definition: Ethics Officers

The Ethics Officer's Association (a professional association for managers of ethics, compliance and business conduct programs) defines an ethics officer as a leader in the area of business conduct (<http://ecoconnects.theecoa.org/home>). The ethics officer often holds a senior management position in an organization. Other titles used for the position include:

- Assistant vice president and director of compliance programs
- Director of ethics and compliance
- Corporate manager, compliance
- Vice president, ethics, compliance, and internal audit
- Director of corporate compliance
- Director of integrity, security, and compliance

The terms compliance officer and ethics officers have sometimes been used interchangeably. However, there is more than a semantic difference between the titles. While compliance evokes the image of someone focused primarily on making sure that laws such as SOX are complied with, the ethics officer's responsibilities go beyond compliance; their primary responsibility is for the management of the organizations' overall ethics program. Of course, an ethics officer may perform compliance roles, and some organizations have actually combined both roles into what they call the ethics and compliance officer (ECO). The differentiation between the two titles is more than a semantic exercise; the image the employees attach to a role may affect how they relate to the

person in the role. For example, employees may tend to be cynical about a program that is heavy on compliance but light on values and integrity. Compliance is mainly about the law and a bit reactive, while ethics tends to be more proactive, and voluntary.

Whether firms create the position of ethics officer as a form of safety net, or because of a genuine commitment to good governance, there is a reason to suggest that under the right conditions, the presence of an ethics officer can be beneficial in many ways. After all, a reputation for moral and ethical behavior can become a source of competitive advantage. Ethical failure, on the other hand, often has serious reputational and financial consequences for a firm, its stakeholders and investors.

### Primary Responsibilities of EOs

The Ethics Officers Association lists some of the key responsibilities of ethics officers to include the following:

- Global accountability for developing and directing an organization's ethics
- Compliance and business conduct function for the total corporation or organization
- Providing leadership, oversight, and expert advice to ensure the development, interpretation, and implementation of ethics and compliance strategies, programs, and policies
- Accountability for all program activities relating to standards of conduct including ethical relationships with customers

### Main Functions and Job Responsibility of EOs

The EO occupies an important and unique role. As the guardian of the company's ethical program and moral code, the EO is a senior level position with responsibility for guiding the organization in the building and implementation of its ethics program. The EO has the following five main job responsibilities:

#### Ethics Education

One of the most important responsibilities of an EO is to help develop and manage a company's ethics education program. Ethics training programs are an important way of building an overall ethics culture (Trevino 1986). Ethics training is about building ethical awareness and developing knowledge about ethical policies and codes of conduct. Both new employees and existing employees should be trained periodically and ethics training involves the following specific tasks:

- Training design.
- Develop training tools (value statements, policy manuals and codes of conduct).
- Training delivery. This involves the actual implementation of the training program.
- Developing ethical guidelines for global environments when necessary.
- Facilitate the building of the ethics infrastructure.

#### Manage Compliance

Compliance is more about required behavior (for internal rules of conduct or external guidelines such as SOX or the Sentencing Guidelines). Especially when the roles of compliance and ethics officers are combined, the EO has the following specific tasks:

- Management of program documentation
- Direct handling of hotline/guideline/internal reporting
- Assessing/reviewing vulnerabilities
- Preparation and delivery of external presentations
- Establishing company policy and procedures

#### Serve as Liaison Between Internal Stakeholders and Top Management

The advisory role of the EO is very important. The EO should have an ear to the ground and serve as a vital source of information for top management, advising and guiding them on the organization's overall ethical orientation. Some specific tasks here include:

- Senior management and/or board briefings/communications
- Serve as the primary link between internal stakeholders and top management including the board
- Be a moral sounding board for top management teams

### Investigative Oversight

The ethics officer has the following oversight responsibilities:

- Overseeing investigations of wrongdoing
- Conducting investigations of wrongdoing
- Oversight and measurement of compliance program performance and effectiveness
- Reporting and prioritizing potential risk areas
- Auditing and monitoring ethics and compliance programs
- Enforcing compliance

### Liaison to External Stakeholders

Having a chief gatekeeper to outside stakeholders is important. The EO has a primary responsibility for ensuring that anyone who needs ethics and compliance information on the organization knows where to look and who to ask. Some specific tasks here are:

- Community relations. The EO is a gatekeeper to the community.
- Representing the organization on relevant boards.

### Job Requirements

One important consideration is determining who to appoint to the position, specifically, the sort of qualifications this individual should have. The EO position is one that comes with multiple expectations and responsibilities. For example, the individual must deal with organizational members, top management, and external stakeholders. The multiple expectations could lead to role conflict. In addition, the EO may sometimes lack the information they need and have to work with incomplete or

ambiguous information and data (Adobor 2006). The role, therefore, requires a resilient individual with certain skills, dispositions, business, and technical knowledge to function well in the role.

### Personal Dispositions/Characteristics

- *Self-Leadership.* An individual with self-leadership qualities would be suitable for this role. Self-leadership is a process through which people influence themselves to achieve the self-direction and self-motivation necessary to perform (Manz 1986). A self-leader will look first within themselves for the necessary tools and strategies to motivate and control behavior and thought. Self-leadership involves opportunity thinking (Neck and Manz 1992). Opportunity thinking involves a pattern of thoughts focusing on opportunities, worthwhile challenges, and constructive ways of dealing with difficult situations (Boss and Sims 2008). Opportunity thinkers take a more active role in dealing with challenges, exerting greater effort, and persistence in overcoming these challenging situations.
- *Tolerance for Ambiguity.* An individual who is able to deal with ambiguity should perform better in the role than someone who requires clarity and certainty of information before acting. Individuals with a high tolerance for ambiguity are also better at adapting more quickly to situations. More important, such individuals are more persistent, take greater initiative, and are pragmatic and generally optimistic people.
- *Personal responsibility for results.* Individuals who take personal responsibility for results and their own success should do well in this role. Such individuals are also more likely to take initiative to control situations because such individuals use negotiation and other initiative-based strategies to achieve results and monitor their own performance.
- *People with moral integrity.* The Ethics Officers Association suggests that an ethics officer must be an individual of “highest integrity.” An ethics officer’s job essentially calls on him or her to exercise ethical leadership within a complex set of circumstances. Whether they

succeed or not may depend on how principled they are as individuals.

- *Transformational leadership skills.* Effective EOs should possess transformational leadership skills. Transformational leaders use influencing strategies to transform follower's self-interest into collective concerns. Burns (1978, p. 4) observes that transformational leadership is "moral in that it raises the level of human conduct and ethical aspirations of both leader and the led." Transformational leaders also use their ability to articulate a captivating vision and inspire others.

In addition to the personal dispositions discussed above, an individual suitable for an EO position must have the requisite business and technical knowledge. Competence on job-related tasks will reduce the task complexity of the position, as a technically competent ethics officer will be able to know what sort of information they need to seek, where to look for information and interpret issues in their proper light.

An EO who has a clear understanding of the nature of a firm's business and environment will be in a better position to understand the complex requirements of the different stakeholders and subsystems they have to deal with. Industry standards, including regulatory provisions that are specific to the firm's business place special demands on the firm. The following are some US and UK examples of important laws an EO has to be familiar with:

- *Regulation of Competition.* These are laws passed to prevent the restriction of fair competition. For example, The Sherman Anti-trust Act, of 1890 and the 1998 Digital Millennium Copyright Act that refines copyright laws to protect digital versions of the copyrighted material, including music and movies.
- *Laws Protecting Consumers.* These laws require businesses to provide accurate information about their products and services. The Federal Trade Commission's Bureau of

Consumer Protection has oversight for enforcing consumer protection.

- *Laws Protecting the Environment.* The Clean Air Act 1970 is one example of such a law.
- *The Federal Sentencing Guidelines for Organizations (FSGO).* The US Congress passed the FSGO in 1991 (Amended, 1994) to create an incentive for organizations to develop and implement programs designed to foster ethical and legal compliance.
- *Sarbanes-Oxley Act (SOX).* The SOX Act establishes a system of federal oversight of corporate accounting practices. Beyond that, some of its key provisions redefine corporate governance.
- *UK Bribery Act 2010.* The Bribery Act 2010 is an Act of the Parliament of the United Kingdom that covers the criminal law relating to bribery.
- *US Foreign Corrupt Practices Act 1977 (FCPA).* The FCPA was enacted for the purpose of making it unlawful for certain classes of persons and entities to make payments to foreign government officials to assist in obtaining or retaining business.

## Organizational Context for Ethical Leadership

Having a Chief Ethics Officer is no guarantee that ethical violations will not happen in the firm and organizations can do much to help the EO. Organizations can do the following things to increase the odds that the EO is effective:

### Organizational Climate

The organization as a whole must have a commitment to ethical behavior. A company-wide commitment to ethics must be reflected in top management support for ethical behavior as well as a company-wide culture that emphasizes ethics, moral behavior, and integrity in all the firm does. A strong ethical climate promotes moral behavior and firms can institutionalize their ethics codes and codes of conduct as a way of building a strong ethical climate.

## Top Management Commitment

Management commitment is important for the effectiveness of the EO. Top management should communicate their support for the ethics officer to all stakeholders as well as respect the position and opinion of the ethics officer. This means that when necessary, top management must submit itself to the jurisdiction of the ethics officer.

## Independence of the EO

Unless an EO has the autonomy to operate, his or her effectiveness will be seriously compromised. The EO must be able to use their personal discretion in decision-making. This independence is important especially since the job responsibilities of ethics officers include overseeing and investigating wrongdoing, including managerial indiscretion.

## Recruitment and Selection

Although organizations have the choice of either recruiting from inside or outside the firm, it may be preferable to recruit someone from outside as a way of demonstrating their neutrality.

## Conclusion

In the end, an EO is just one individual. It is the responsibility of organizational leaders to ensure that they create an ethical climate and build an ethical culture. The EO can certainly play a key role and organizations can do much to ensure that once in their role, ethics officers can be effective.

## Corporate Governance

Greg Shailer

Research School of Accounting, The Australian National University, Canberra, ACT, Australia

### Synonyms

Corporate control; Enterprise governance; Organizational governance

### Definition

“Corporate governance” describes the processes, structures, and mechanisms that influence the control and direction of corporations. In this context, “control” is about how stakeholders and other agencies external to a corporation control or influence those responsible for directing and managing the affairs of the corporation, and “direction” is about the strategic guidance and management of the corporation.

A broad interpretation of “control and direction” encompasses the roles and influences of governments and regulatory agencies, capital market participants and existing shareholder and debtholders, managerial labor markets, suppliers and customers, community and special interest groups, and internal participants (directors, executive managers, and other employees). Narrow interpretations of “control and direction” tend to focus on influential shareholders, directors, and executive managers.

### Discussion

Elemental forms of corporations were used since the early Roman Empire to organize towns, colonies, guilds, religious orders, and universities. Their purpose was to facilitate perpetual succession of a property-holding entity, independent of the state or monarch. Corporations acquired significant commercial roles with the advent of

the regulated company around the beginning of the sixteenth century and the development of the joint-stock company shortly thereafter.

Most countries now allow at least two main kinds of limited liability companies, typically distinguished on a size basis or their ability to invite public subscriptions to their shares. An ownership dichotomy is generally captured by labeling companies as “private” or “public” (these are legal terms in some jurisdictions and informal in others), where “public” usually includes all, but is not limited to, corporations listed on stock exchanges. Some differences between private and public corporations also vary considerably across jurisdictions. These differences, and differences in shareholder behavior, are important when looking at countries’ modes and methods of regulating corporate governance. Differences in form’s of modern corporations, while possible reflections of historical, political, and cultural differences, are necessarily the products of regulation.

Characterizing corporations involves at least three aspects of relationships: (1) interrelations of the associated persons, (2) their relations to other persons in society, and (3) their relations to the state. Differences in emphases on these relationships have led to different characterizations of corporate governance regimes in different countries. Generally, however, there are two dominant perspectives or “models” of corporate governance practices: the principal-agent perspective and the pluralist (or multistakeholder) perspective.

The *principal-agent* perspective (also known as the “Anglo-American model”) is typically, but not exclusively, applied in markets characterized by dispersed shareholdings in (ownership of) public corporations that is separated from the management (control) of the corporation. This perspective emphasizes issues associated with the potential **conflicts of interests** of the board of directors and executive management (as agents) in serving the interests of shareholders, who are regarded as the principals in a principal-agent relationship with the board and management (see ► [Agency Theory](#)).

The *pluralist* or *multistakeholder* perspective is also known as the “European model” and is more common in markets characterized by concentrated ownership of public corporations (where there is often a controlling shareholder or group of shareholders, such as a family). It is sometimes referenced merely as a “stakeholder theory” model. Stakeholders are any individual or group who can affect or is affected by the activities of the corporation’s activities. These include shareholders, lenders, employees, customers, suppliers, special interest groups, and the communities in which businesses operate. While European corporate governance practices are often described as according with a pluralist perspective, descriptions of practices often focus on shareholders and employees as the main stakeholders to be considered by directors and managers. There is a tendency to identify the pluralist perspective as ethically superior to the shareholder primacy approach emphasized in the principal-agent perspective and more consistent with a **corporate social responsibility** or **corporate citizenship** orientation. However, the pluralist perspective implicitly invokes (but has not resolved) issues concerning **distributive justice** and corporate decision-makers’ obligations to fairly adjudicate between competing interests and claims.

The principal-agent versus pluralist dichotomy is misleading because there are considerable differences in some corporate governance regulations and practices between countries associated with the Anglo-American model, such as the UK, USA, Canada, and Australia, and considerable variation in corporate governance arrangements across continental Europe.

A less dominant perspective of how corporate governance can be modeled is based on normative concepts of **stewardship**. This is inherently an ethics perspective, whereby a corporation’s executives and managers are stewards responsible for safeguarding and proper effective use of resources entrusted to their care. While stewardship implies agency, the principles of stewardship are not confined to principal-agent perspective of corporate governance. From the principal-agent perspective, the obligations of corporate stewards will

be associated with the interests of shareholders. A pluralist perspective associates stewardship obligations with a broader and more complex set of interests, and thus may tend towards a corporate social responsibility or corporate citizenship perspective.

Corporate governance is also sometimes discussed in terms of *resource dependence theory* (or resource dependency theory). This perspective is internally focused and manager-centric, positing that a board of directors exists as a provider of resources to support executives in their pursuit of organizational goals. This approach is not directly concerned with stakeholders outside the corporation and advocates that most corporate decisions should be made by executives with limited board oversight. However, resource dependence theory can be used in conjunction with either the principal-agent perspective or the pluralist perspective and does not contradict the principles of stewardship.

Ethical concerns in relation to corporate governance practices have been raised since the emergence of joint-stock corporations. This is often illustrated by reference to Adam Smith’s *An Inquiry into the Nature and Causes of the Wealth of Nations*, first published in 1776, from which some or all of the following quotation is frequently employed to illustrate early recognition of the principal-agent problem arising from the separation of ownership and control of corporations:

The directors of such companies, however, being the managers rather of other people’s money than of their own, it cannot well be expected that they should watch over it with the same anxious vigilance with which the partners in a private copartnery frequently watch over their own. Like the stewards of a rich man, they are apt to consider attention to small matters as not for their master’s honour, and very easily give themselves a dispensation from having it. Negligence and profusion, therefore, must always prevail, more or less, in the management of the affairs of such a company. [Book V, Chapter 1]

In addition to the **shirking** problem implied in the above quotation, ethical concerns are often raised in the media regarding whether management and, particularly, CEOs are unfairly

(excessively) remunerated. This is often raised in terms of the magnitudes of executive salaries and bonuses, the weak relationship between remuneration levels and corporate performance, and the magnitude of CEO remuneration relative to the average remuneration of other employees. Concerns in this regard appear the strongest in markets where the principal-agent problem prevails because directors and managers in corporations with dispersed shareholdings enjoy greater autonomy, compared to the directors and managers in corporations in which shareholders have sufficiently large holdings to give them control over the board. Controlling shareholders can usually determine board membership and thus appoint executives and influence management decisions.

In addition to the ability of managers to enrich themselves at the corporation's or shareholder's expense, other forms of **expropriation** are also prevalent concerns in corporate governance. For example:

- Managers may use corporate assets for non-productive purposes that provide utility to managers (perquisites or "perks"), such as extravagant offices, luxury motor vehicles, and superfluous travel and entertainment expenditures.
- Managers (and controlling shareholders) may cause the corporation to purchase (sell) assets at an inflated (deflated) prices from (to) a party in which the manager (or controlling shareholder) has a vested interest.
- Managers (and controlling shareholders) may cause the corporation to invest in projects that enrich the manager (or controlling shareholders) or related parties but which are not the best investment options in terms of corporate value.
- Controlling shareholders can use their power to have family members appointed to managerial positions when they are not the best choices for such roles (**nepotism**).

Cooperation between management and large (influential) shareholders, in the absence of controlling shareholders, may lead to

entrenchment of both managers' and the shareholders' influence. Other types of stakeholder concentration or coordination can also matter. For example, environmental interests may be best served where environmentally conscious stakeholders are numerous but sufficiently coordinated to exert influence directly on a corporation's management or on a regulator. Similarly, employees' interests may be more effectively represented through coordinated collective action, although the governance of any labor unions that are involved may also matter in this regard.

Borrowing from the extensive civil governance literature, corporate governance practices can be evaluated on the basis of transparency, accountability, and participation. *Transparency* refers to the availability of information to stakeholders and depends on the clarity of rules, decisions, and outcomes. *Accountability* means that decision-makers are answerable to stakeholders or those from whom decision-makers derive their authority. *Participation* complements accountability; if stakeholders can effectively participate in determining who will be the decision-makers in a corporation (e.g., by nominating and electing directors), they can more effectively hold them accountable for their decisions.

Recent regulatory mechanisms addressing corporate governance concerns emphasize **accountability** and **transparency** through required disclosures. Mandated disclosures to shareholders include financial statements and related disclosures in the annual report. Because the required reports are produced and disseminated by management and the board of directors, all jurisdictions mandate an independent audit of the public corporations' annual financial statements provided to shareholders. Nonetheless, the reliability of corporate disclosures is a persistent matter of concern to investors and regulators. This has resulted in ongoing concerns about the contribution of auditing in safeguarding the integrity of financial reporting. The most substantial regulatory developments directly affecting corporate governance have been precipitated by corporate scandals and large financial failures that eroded confidence in stock markets. This is evident in:

1. Following numerous offerings of shares in highly speculative and dishonest ventures, the *Bubble Act* of 1720 prohibited the public offering of shares unless the company had been formally incorporated by an act of parliament.
2. Regulatory developments in the years following the Wall Street Crash of 1929 (including the formation of the *Securities Exchange Commission* in the USA).
3. Regulatory responses (such as the *Sarbanes-Oxley Act* in the USA) to the particularly large corporate accounting scandals in developed markets during 2000–2003.

The latter include One.Tel in Australia, Swissair in Switzerland, and Enron in the USA in 2001; Adelphia, AOL, Bristol-Myers Squibb, Duke Energy, Freddie Mac, Halliburton, Homestore.com, Kmart, Sunbeam, Tyco, and Worldcom in the USA in 2002; and Parmalat in Italy and Nortel in Canada in 2003. The accounting scandals of this era renewed attention on the independence of auditors. The processes for selecting and remunerating auditors, and their working relationships with officers and employees of the corporation, are threats to auditor independence, which is fundamental to their role in alleviating uncertainties attaching to the corporate financial reports provided by management. Concerns regarding auditor independence receive substantial regulatory attention in many countries and in professional codes or standards concerned with the ethical conduct of auditors.

Few jurisdictions mandate disclosures concerning corporate social responsibilities. The most significant development in this regard is **integrated reporting**, and South Africa is the first country to regulate in this direction. The *International <IR> Framework* produced by the International Integrated Reporting Council defines an integrated report as “a concise communication about how an organization’s strategy, governance, performance and prospects, in the context of its external environment, lead to the creation of value over the short, medium and long term.” Integrated reporting appears to align corporate accountability with a multistakeholder perspective; the “guiding principles” in the

framework advocates that “an integrated report should provide insight into the nature and quality of the organization’s relationships with its key stakeholders.” However, the framework also states that “the primary purpose of an integrated report is to explain to providers of financial capital how an organization creates value over time.”

In addition to regulatory oversight and shareholder votes, managers and directors also face the discipline of the capital markets and managerial labor markets. The primary mechanisms by which the capital market disciplines decision-making are the availability (rationing) and cost of capital and takeovers (also known as the market for control). The functioning of the capital market mechanisms depends on the relevant regulatory regime, the level of capital market development, the concentration or diversity of current ownership, and the capital needs of the company.

### Corporate Governance Codes

The *G20/OECD Principles of Corporate Governance* (first issued in 1999) is intended to help policy-makers evaluate and improve their legal, regulatory, and institutional frameworks for corporate governance. The principles are also promoted as guidance for stock exchanges, investors, corporations, and others that have a role in the process of developing good corporate governance. The G20/OECD guide identifies six principles that should be achieved by a corporate governance framework, which should:

1. Promote transparent and fair markets and the efficient allocation of resources. It should be consistent with the rule of law and support effective supervision and enforcement.
2. Protect and facilitate the exercise of shareholders’ rights and ensure the equitable treatment of all shareholders, including minority and foreign shareholders. All shareholders should have the opportunity to obtain effective redress for violation of their rights.
3. Provide sound incentives throughout the investment chain and provide for stock markets to function in a way that contributes to good corporate governance.

4. Recognize the rights of stakeholders established by law or through mutual agreements and encourage active cooperation between corporations and stakeholders in creating wealth, jobs, and the sustainability of financially sound enterprises.
5. Ensure that timely and accurate disclosure is made on all material matters regarding the corporation, including the financial situation, performance, ownership, and governance of the company.
6. Ensure the strategic guidance of the company, the effective monitoring of management by the board, and the board's accountability to the company and the shareholders.

Many countries have “corporate governance codes” that are issued by regulators, stock exchange, industry groups, or independent agencies seeking to establish themselves as “authorities” in a jurisdiction. Compliance with some codes is mandated by law or listing requirements, but many are voluntary. Codes that are mandated for membership of an industry group are essentially voluntary. Many corporations adopt their own individual “code” of practice.

A significant concern is the extent to which voluntary codes of conduct are used merely as communication vehicles by corporations that wish to project particular intentions and standards and the extent to which they are used as management tools to promote particular standards of behavior within corporations. Without reliable mechanisms for supervising and monitoring internal activity, individual voluntary codes are unlikely to have much credibility. Diversity in individual codes may also be an impediment to their effectiveness. Some consistency might be achieved through the adoption of particular international standards. The OECD has sought to facilitate this through its *Guidelines for Multinational Enterprises*. Their coverage includes elements pertaining to labor interests, environmental interests, disclosure practices, and competitive behavior. They provide nonbinding principles and standards for responsible business conduct in a global context consistent with applicable laws and internationally recognized standards.

The OECD claims that the guidelines are the only multilaterally agreed (by OECD members) code of responsible business conduct that governments have committed to promoting. These guidelines are intended to be compatible with a broad range of regulatory systems and so can be applied in any country and to any corporation; consequently, they are very general.

Other organizations have developed more specific standards in particular areas. For example:

- International Organization for Standardization's ISO14000 standards for managing and reporting the corporation's environmental impact and ISO9000 standards for quality assurance in business-to-business dealings.
- Social Accountability International's SA8000 standard, which is aimed at labor conditions. SA8000 is based on international workplace norms in the ILO conventions and the UN's *Universal Declaration of Human Rights* and the *Convention on Rights of the Child*.

### The “Ownership” Debate

A persistent debate in relation to the characterizations of corporations, and identifying or ordering the stakeholders to whom those charged with governance hold some responsibility or obligation, is whether or not shareholders *own* a public corporation. While it is not disputed that shareholders own shares in a corporation and that these shares attach to residual interests (i.e., interests that remain after all other legal claims have been satisfied) in the property of the corporation, this can be divorced from the notion of owning the corporation itself. This ownership debate references the rights and obligations of property ownership, the behavior or attitudes of shareholders, and what it means for a corporation to be a “legal person.” At the extremes, the competing protagonists in this debate assert either (1) that shareholders are the owners of a public corporation by definition or (2) that corporations have no owners. There are other positions concerning who, if anyone, owns a corporation, including propositions that the roles of the founding entrepreneurs or current managers in determining the strategic purpose and objectives of a corporation entail some notion of

ownership. Those arguing that shareholders do not necessarily own a corporation note that owning shares in a corporation does not necessarily give a person the opportunity to make or influence key decisions (but this opportunity may vary with the number shares owned); owning shares does not confer any legal or moral right to use the assets of the corporation for the shareholder's private purposes; shareholders cannot withdraw their notional investment in the corporation and that changing the shareholder of a corporation does not change the legal personhood of the corporation.

## Corporate Governance and Values-Based Management

C. Richard Baker  
Willumstad School of Business, Adelphi  
University, Garden City, NY, USA

## Synonyms

Corporate social responsibility; Ethics;  
Governance; Sustainability

## Introduction

This entry deals with *corporate governance and values-based management*. These two terms are not synonymous, but both terms have become increasingly prominent in the academic and professional management literatures during recent years.

*Corporate governance* involves the structures, rules, and regulations that determine the ways that corporate enterprises are managed and directed. Corporate governance laws and regulations focus primarily on the responsibilities and obligations of boards of directors and corporate executives toward shareholders (Shah and Napier 2017).

In contrast, *values-based management* is based on the argument that human values are at the core of managing organizations (Jaakson 2010) and that it is the responsibility of managers to identify and support shared values within and outside of the organization. Thus, it can be seen that *values-based management* transcends corporate governance and the traditional focus on the creation of economic value for shareholders. It is important to examine the relationship between corporate governance and values-based management because boards of directors and corporate executives need to be aware of emerging trends in their environments, one of which is a growing pressure from external parties for greater attention to be paid to the values of a broad spectrum of corporate stakeholders.

## Historical Background

The first recorded corporate governance controversy took place in 1609 between the shareholders and directors of the Dutch East India Company, which was also the world's first listed public company (Frentrop 2003). While corporate enterprises in the Netherlands and Great Britain often had as many as 40 directors who were all required to be investors in the company, Shah and Napier (2017) indicate that British joint stock companies (i.e., corporations) were usually managed by a single “governor.” The “court of governors” or “board of directors” as the ruling body for a

corporate enterprise emerged only gradually. By the nineteenth century, limited liability companies (i.e., another word for “corporation”) were typically run by “directors.” The nineteenth century also saw a refinement in the role of boards of directors, often in response to corporate scandals, with a gradual change whereby the director was a typical shareholder to the board of directors as a whole being seen as a “representative of the shareholders.” It should be noted, however, that the concept of a “stakeholder” as an individual or group of individuals who were not shareholders (i.e., such as employees, customers, suppliers, or the general public) did not exist and this concept only saw its emergence in the late twentieth century.

The governance of early US corporations, of which over 20,000 existed by the mid nineteenth century, was similar to that of “republics,” in that there were control mechanisms spelled out in corporate charters which were intended to prevent fraud and usurpation of power by executives or large shareholders. This fear of dominance by corporate executives and large shareholders persisted for many years, and in the 1930s, legal scholars such as Berle and Means became increasingly critical of this dominance which was detrimental to shareholders. At the same time, it is important to note that these scholars did not address the rights of “stakeholders” who were not shareholders, and thus, the emphasis in corporate governance was primarily on the responsibility of boards of directors and corporate executives in relation to shareholders.

Economic expansion after World War II saw the emergence of multinational corporations and the establishment of a managerial class. Management scholars observed that large corporations had dominant control over business affairs with little accountability or monitoring by boards of directors. However, academic research by La Porta and Lopez-de-Silanes (1998), La Porta et al. (1999, 2000) and others concluded, based on multinational studies of corporate governance, that greater investor protection, improved economic development, reduced government regulation, less corruption, and better functioning of labor markets were associated with common law

systems of corporate governance such as those of the United States and Great Britain (La Porta et al. 2000).

## The Role of the Board of Directors

The board of directors is expected to play a principal role in corporate governance. Among other things, the board has responsibility for CEO selection and succession, providing feedback to management on the organization’s strategy, compensating senior executives, monitoring financial performance and risk, and ensuring accountability of the organization to shareholders and regulators. A board of directors typically has several committees (e.g., compensation, nominating, and audit) to perform their work. There are numerous other responsibilities of the board of directors, some of which are summarized below:

- Board members should be informed and act ethically and in good faith, with due diligence and care, in the best interest of the company and the shareholders.
- Review and guide corporate strategy, objective setting, major plans of action, risk policy, capital plans, and annual budgets.
- Oversee major acquisitions and divestitures.
- Select, compensate, monitor and replace key executives, and oversee succession planning.
- Align key executive and board remuneration with the longer-term interests of the company and its shareholders.
- Ensure a formal and transparent board member nomination and election process.
- Ensure the integrity of the corporation’s accounting and financial reporting systems, including their independent audit.
- Ensure appropriate systems of internal control.
- Oversee the process of financial reporting.

## Mechanisms of Corporate Governance

Corporate governance mechanisms involve both external and internal aspects. External monitoring of corporate executives occurs when an

independent third party (e.g., the external auditor) attests to the accuracy of information provided by management to shareholders. Stock analysts and creditors may also perform external monitoring. An ideal monitoring and control system should regulate both motivation and ability while providing incentive alignment toward corporate goals and objectives.

Internal corporate governance monitors activities and takes corrective actions to accomplish organizational goals. Internal corporate governance controls include:

1. *Monitoring by the board of directors:* As mentioned previously, the board of directors has the legal authority to hire, fire, and compensate top management, and in this way the board safeguards the interests of shareholders.
2. *Internal control procedures and internal auditors:* Internal control procedures are policies implemented by a corporation's board of directors, audit committee, and management to provide assurance of achieving objectives related to reliable financial reporting, operating efficiency, and compliance with laws and regulations. Internal auditors test the design and implementation of the entity's internal control procedures and the reliability of financial reporting.
3. *Compensation:* Performance-based compensation is designed to relate management compensation to performance.
4. *Monitoring by major shareholders:* Given their significant investments in the corporation, major stakeholders have the incentives, combined with the power to monitor management.

### **Expansion of the Definition of Corporate Governance**

Beginning in the 1990s, the duties of corporate director began to expand beyond their traditional responsibility to shareholders. For example, the largest public pension plan in the United States,

the California Public Employees' Retirement System (CalPERS), became increasingly involved in institutional shareholder activism which led to the dismissal of board members and corporate executives. In the early 2000s, the bankruptcies and frauds of Enron and WorldCom, as well as lesser corporate scandals, led to the passage of the Sarbanes-Oxley Act of 2002, which imposed many new legal requirements and regulations regarding corporate governance, including regulations enhancing the independence of external auditors.

### **Values-Based Management in Relation to Corporate Governance**

As mentioned previously, *values-based management* is defined as a series of interconnected managerial activities to ensure the acceptance of relevant organization values inside and outside the organization. Values-based management maintains that human values are at the core of managing organizations. The values-based approach to management argues that human values drive the mission, goals, and objectives of organizations and inform leadership, strategy, decision-making, ethics, and social responsibility. In short, human values underlie all aspects of managing organizations, and human organization represents a direct expression of human values.

A well-known psychologist, Milton Rokeach, has postulated that human beings possess two types of values: instrumental (relating to personal conduct) and terminal (relating to desirable end states in life). Examples of instrumental values include being logical, helpful, and self-controlled, whereas terminal values include wisdom, an exciting life, and a sense of accomplishment. These value preferences vary considerably among human beings, and it is believed that they are formed early in a person's life, thus constituting a permanent element of a person's personality. Studies have shown that a person's value preferences are relatively stable through time and not ordinarily subject to change.

The author of this entry studied the value preferences of undergraduate students at a major urban university using the Rokeach Values Survey. The findings of this study were that there appear to be significant differences in values preferences among students studying business administration and students majoring in liberal arts. Significant differences were found on eight (out of thirty-six possible) values: (1) A comfortable life (greater for business students), (2) a world of beauty (less for business students), (3) wisdom (less for business students), (4) ambitious (greater for business students), (5) clean (greater for business students), (6) imaginative (less for business students), (7) family security (greater for business students), and (8) responsible (greater for business students). The findings of this study suggest that business students, even in the early stages of their careers, seem to favor values that are oriented toward economic success. This leads to an important question about the relationship between corporate governance and values-based management, which is who is it that decides what the values of a corporation will be?

Pursuant to the legal system of the United States, it is in fact the board of directors and the executive management of the company that decides what the values of the corporation will be. The board of directors and the executive management may decide to pursue an approach which emphasizes certain values, or they may decide to pursue a primarily economics-based approach to managing the company. However, regardless of the decision made by the board of directors and the executive management, the corporation laws of the United States mandate that the primary responsibility is to the shareholders of the corporation. Thus, if a values-based approach is chosen, the board of directors and the executive management would need to explain two things to the shareholders; first, are the values promulgated by the board of directors and the executive management consonant with the values of the shareholders; and, second, will the values-based approach be beneficial to the shareholders. If the answer to either of these questions is negative,

there might be several results. One might be that the shareholders would simply sell their shares, and thus the company would be deprived of capital for future growth and expansion. Second, there might be shareholder derivative lawsuits to force out the board of directors and the executive management (as was the case with shareholder activists as mentioned above). Neither of these results would be particularly desirable; hence, a values-based approach to management carries with it the risk of alienating shareholders. A well thought-out strategy must therefore be adopted by the board of directors and the executive management in order to communicate to shareholders why a values-based approach would be superior to an economics-based approach to managing the company. If a values-based approach can be shown to achieve greater economic value for shareholders, then there should be a favorable outcome for both shareholders and the other stakeholders of the company.

## Corporate Personhood and Corporate Responsibility to Race

Nneka Logan  
Virginia Tech, Blacksburg, VA, USA

### Synonyms

Corporate Communication; Corporate Personhood; Corporate Social Responsibility (CSR); Diversity; Equity and Inclusion (DEI); Race; Social Justice

### Introduction

The question of what responsibilities corporate persons have to society is addressed in the corporate responsibility to race (CRR) theoretical concept. CRR is defined as “a new form of corporate discourse that uses corporate resources to proactively address racial tensions by illuminating the implications of racial oppression and privilege, giving voice to racial issues and heightening public awareness of racism in order to foster a more just, egalitarian and harmonious society” (Logan 2019, p. 983). This concept was later developed into a theory of corporate communication that maintains CRR “provides a new theoretical avenue to identify, understand, contextualize, theorize, and analyze corporate communications about race” (Logan 2021, p. 7).

### The Emergence of CRR

As a theoretical concept, CRR emerged from empirical observations of how some corporations have communicated about race in recent years. Perhaps the first corporation to proactively communicate about matters of race and equity in a communications campaign was Starbucks in 2015. The coffee company launched the controversial Race Together campaign to encourage

conversations about race and racism in an effort to improve race relations in the USA. Since then several organizations have followed suit. For example, in a 2016 speech to employees AT&T CEO, Randall Stephenson, spoke of the importance of achieving understanding across racial differences. In 2017, P&G introduced “The Talk” advertising campaign. It portrayed difficult conversations generations of parents of black children have had to have with their children in order to prepare them to live in a world where systematic, structural racism is the status quo. In 2019, P&G returned with “The Look” ad campaign. It highlighted the unconscious bias and micro-aggressions people of color face as a part of everyday life. After the 2020 murder of George Floyd by a Minneapolis police officer, more corporations have taken a stand against racism, supporting racial justice and advocating for equity and harmony. Their efforts have been met with praise as well as criticism and draw attention to the changing role of business in society.

### The Purpose of CRR

CRR deepens understanding and sharpens explanations of how corporations engage in racial matters. CRR is based on three interrelated premises including: “(a) Corporations have a responsibility to support racial justice by communicating in ways that improve race relations because (b) corporations are organizational forms that have emerged through processes of racism and racialization, and (c) corporations have directly and indirectly perpetuated – and benefited from – racial discrimination and oppression, which has contributed significantly to racial strife and social instability” (Logan 2021, p. 8). In other words, “because the institution of corporate America has capitalized on racial discrimination and perpetuated racial oppression, the institution as well as the organizations that comprise it have a responsibility to work toward achieving a more racially just and harmonious society” (Logan 2021, p. 8). CRR theory has relevance and application anywhere where racial difference fosters discrimination and where organizational resources can be utilized to counter oppression.

### Theoretical Foundations

CRR aligns with organizational studies perspectives that hold organizations are racialized spaces that have historically participated in processes of racialization and produced privilege and disadvantage along racialized lines (Nkomo 1992). CRR also draws theoretical inspiration from critical race theory (CRT). CRT holds that the law – far from being neutral, objective, and colorblind – has actually functioned to reinforce white racial privilege and power in ways that harm non-white people. CRT also holds that a deeper awareness of history facilitates a richer understanding of contemporary racial problems and that racism is endemic in the US. CRT places race at the center of inquiry and situates race as the primary theoretical lens for analysis (Crenshaw et al. 1995) as does CRR.

### The Corporation's Racialized Roots

CRR exposes what Logan (2019, 2021) characterized as the racialized roots of the corporation by examining the *Santa Clara v. Southern Pacific Railroad* (1886) Supreme Court decision that allowed a business organization to gain the personhood protections of the Fourteenth Amendment. According to legal and historical scholars as well as framers of the Fourteenth Amendment (Magliocca 2013), the amendment was originally intended to guarantee the full personhood and citizenship of human beings that were particularly vulnerable and in need of its protection – formerly enslaved black people. However, following the amendment's ratification it was often used to protect the personhood of corporations, instead of black people. Fourteenth Amendment protections laid the foundation for corporate persons to gain a series of constitutional rights. As corporations grew in wealth and power throughout the nineteenth, twentieth, and twenty-first centuries, they also perpetuated racial division and oppression by exploiting slavery (Biondi 2003), participating in forced labor (Blackmon 2009), and profiting from mass incarceration (Alexander 2012; DuVernay et al. 2016). CRR acknowledges this history while facilitating a focus on how today's corporate persons can leverage their power to support racial equity, justice, and harmony.

### Differentiating CRR

CRR is differentiated from other forms of corporate discourse because of how it engages with race, situates the significance of race, and constitutes the relationship between race and corporate organizations as well as the relationship between business and society. Unlike CRR, typically corporate discourse about race aims to privilege organizational interests over societal needs. For example, although corporate DEI communications have often focused on including racial minorities, a central goal of these efforts was to expand the corporate labor pool, not necessarily to enrich the lives of racial minorities or foster equity in employment, which would have substantially contributed to fostering equity in society. Similarly, marketing discourse with a multicultural bent intends to sell products beyond the mainstream with the objective of growing organizational profits, not necessarily ensuring equal access to products and services or equitable treatment for customers. As well, crisis communications pertaining to race often aim to distance the corporation from allegations of racism, not root out or remove racism from the organization. Traditional public relations discourse advances corporate objectives by helping organizations to build good relationships with stakeholders and publics in order to bolster corporate reputations and images. Bolstering corporate images and reputations ultimately creates conditions conducive to enriching the corporate financial bottom line, but may not contribute to strengthening societal well-being. Although CSR emphasizes how organizations can contribute to society, such contributions are primarily valued in terms of their potential to produce return on investment (ROI) for participating corporations. CRR, on the other hand, primarily emphasizes the needs of society over the financial interests of the corporation, because it recognizes the multitude of corporate functions already dedicated to producing profit.

### CRR Communication Principles

CRR's focus on societal well-being – particularly where matters of race are concerned – is evidenced in its five core communication principles:

1. CRR communications must name a racist act, practice, structure, or system. It is not enough to offer abstract statements that vaguely condemn racism.
2. The complexities with which contemporary forms of racism operate must be highlighted along with the implications of racism in CRR communications.
3. CRR communications should also directly advocate for racial justice, equity, and harmony. This means the corporation should advance a vision for anti-racist action and communication for the organization, its stakeholders and publics.
4. A desire to improve race relations should be present. Thus, CRR communications should not be divisive. While they should admonish racism, they should also invite those blinded by bias to see the world in anti-racist ways.
5. Communications demonstrating CRR should emphasize the needs of society over the economic interests of the corporation because unlike other corporate areas such as sales and marketing that are designed to yield financial rewards, CRR is not focused on ROI. Its payoff is more altruistic – doing good for society’s sake (Logan 2021).

In practice, these principles can be used to guide organizations communicating about matters of race, DEI, and social justice. In theory, they help contextualize corporate racial discourse as well as facilitate the analysis of such communications.

### Forms of CRR

There are many forms of corporate discourse that may fall within CRR’s theoretical scope. For example, CRR may be used to analyze or contextualize public relations campaigns, advertising campaigns, leadership communications, corporate statements, and even corporate values such as Ben & Jerry’s racial justice value. It reads in part, “We invite you to join us on a journey to better understand issues of race in our country, to acknowledge the existence of systemic racism and the implicit biases that all of us carry, and to ultimately commit to . . . join hands, and move forward together” (Ben and Jerry’s [n.d.](#), para. 4).

Corporate policies and practices may also fall within the purview of CRR.

### Implications of CRR

When corporations mobilize their resources to oppose racism, support racial justice, and communicate in ways that aim to improve race relations, they articulate a corporate responsibility to race. Their advocacy amplifies the significance of race in the public sphere and can positively influence individuals and other organizations to make meaningful moves toward righting racial wrongs of the past and healing the wounds of racial discrimination that still plague the present. In other words, CRR aims to contribute to a healthier and more harmonious society. Ultimately, CRR situates corporate personhood as a conduit for corporate racial responsibility while providing a means to conceptualize, theorize, and analyze how today’s corporations engage in matters of race through their words and actions.

## Corporate Power over Human Rights

David Birchall  
University of Nottingham Business School,  
Ningbo, China  
London South Bank University, School of Law  
and Social Sciences, London, UK

### Synonyms

Business Structures; Corporate Authority; Power and Human Rights

### Introduction

The business and human rights (BHR) movement has developed rapidly since the 1990s, in lockstep with spiralling corporate size, wealth, and influence. BHR attempts to hold corporations to account for human rights abuses. As such it does not address corporate power directly, and it is not

of fundamental importance to BHR whether corporations are growing more powerful in relation to governments, society, or smaller businesses. Rising corporate power, does, however, have marked effects on access to human rights.

Corporations evidently hold the power to abuse human rights and to avoid accountability for these abuses. This is clear from numerous major cases, from the Bhopal gas leak to the collapse of Rana Plaza in Bangladesh, both of which resulted in major fatalities and demonstrated the failures of current practices, regulation, and remedy. Environmental degradation with fatal consequences, modern slavery, and complicity with oppressive regimes are all examples of corporations using their power to further their profits through rights abuse.

But corporate power over human rights goes beyond these direct interactions. With the growth of vast multinational corporations, quasi-monopolistic tech firms, and financialized companies such as private equity and hedge-funds, a new threat to human rights through business has developed. Here, the risk is less of the overt, egregious case of human rights abuse, and more of corporate power systematically denying access to rights to large groups for the purposes of investor profit.

This can occur through a multitude of ways. One important way is large investment firms influencing the price and/restricting the supply of essential items. Investor speculation on food commodity derivatives was designated as a major cause of the global food crisis, beginning in 2007. A major topic today, highlighted by Rory Hearne (2020) and others, is that of “corporate landlords.” Corporate landlords refer to companies – mainly private equity firms – that buy entire apartment blocks to rent them to tenants. Because of the scale at which this occurs it has a major impact on housing prices, greatly restricting the ability of individuals to purchase a home, or to rent affordably. Deleterious effects on access to rights also occur in investor-owned healthcare, prisons, and other essential services.

The issue in each of these cases is one of power. The investment firm has the capacity to make investments – in foodstuffs, housing, hospitals – on such a scale as to affect access to the

relevant right. With some exceptions, such as cases of medical negligence and illegal evictions, the actions of these companies cannot be said to “violate” rights, at least in interpersonal sense. From a human rights theory perspective this presents an interesting problem, as insidious price rises in essential items and retrogressions of access to essential resources in the name of maximizing shareholder value reshape societies, but there is no clear act of human rights violation.

### **Main Text: Analyzing Corporate Power**

For this reason, corporate power is an interesting lens on access to human rights (Mikler 2018). To study the issue more systemically, in an article for the *Business and Human Rights Journal* published in 2021, the author delineated four sites of corporate power over human rights: first, power over individuals; second, power over materialities; third, power over institutions; and fourth, power over knowledge. The framework captures four key ways in which corporations may influence access to rights. Human rights are inherent in individuals and can be transgressed through direct interaction. Human rights, and particularly socioeconomic rights, rest on a material foundation that corporations as economic actors have a significant ability to affect. Human rights are legal standards and are implemented through governance structures that corporations may also influence. Finally, corporations can influence the epistemic framework through which we understand human rights, including the form, scope, and limits of responsibility.

The framework draws on the work of Barnett and Duvall (2005), applying their generalist typology of power to the specific issue of corporations and human rights. They disaggregate power into compulsory, institutional, structural, and productive elements to provide a comprehensive categorization of power in its totality. Business has power over human rights insofar as it can influence, violate, retrogress, reshape, realize, or restrict those rights, and propose a moderated version of the four forms of power identified by Barnett and Duvall to capture the specifics of

corporate power over human rights. The first is the direct, unmediated, or weakly mediated power that corporations can wield over rights-holders. The next three are mediating sites through which corporate power can be used to affect human rights. Human rights are underlain by material foundations, whether land, supply of essential goods, personal wealth, or state funding, and therefore materialism is crucial. They are over-arched by law and institutions that enforce and structure the rights. They are also affected at the meta-level by social norms which constitute knowledge around the right, most importantly the scope, limits, and form of the responsibilities inherent therein. This captures realist, Marxist, institutionalist, and constructivist priorities.

The aim of the framework is to allow categorization of different forms of corporate power. But there was also a normative aim based in a concern that BHR as a field was too narrowly focused on a selection of direct interpersonal violations and/or egregious acts of wrongdoing, to the marginalization of more insidious uses of corporate power. The framework is, as such, designed to open space to discuss a wider range of corporate influences over human rights.

### **Four Locations of Corporate Power**

Power over individuals includes overt compulsory power, and covers the direct interactions that occur between corporations, including managers, and individuals. Power over individuals is the most likely to be directly regulated or prohibited form of power and most work in the BHR field addresses this form. Human rights violations are, paradigmatically, defined by this direct connection, in which the violator actively wrongs an individual, potentially leading to judicial remedy. Power over individuals includes the direct power that employers have over individuals, and the power to influence vulnerable individuals, such as children, through marketing and other means.

Power over materialities relates to the underlying material conditions on which rights rely. Corporations frequently control access to, or shape,

these materialities. This is evident with corporate landlords, privately owned hospitals, prisons, nursing homes, and pharmaceutical companies, global agribusiness, and privatized utilities, such as water. Corporations also have an outsized impact on climate change, and through investments and finance on many other avenues of life (Macchi 2021). Corporations, generally run according to the principle of shareholder primacy, are often incentivized not toward universal access – the basic human rights obligation of states in relation to material rights – but toward constructed scarcity or reduced services. Because human rights materials are, by their nature, essential and rarely conducive to truly competitive markets, profit can be earned through restricting access. In housing this occurs through corporate landlords owning so many properties in a region that they have a controlling influence over prices (Birchall 2021b). In healthcare, it may come from “hidden fees” or reduced levels of care.

Power over institutions relates to how corporations shape institutional priorities and evade accountability. Corporations have been growing in size, wealth, and importance for decades. Particularly since globalization accelerated around the 1970s, corporations have been able to wield their fleet-footed global citizenry to bargain for pro-business policies, including lower taxes and reduced labor rights. This is a structural power stemming from states being territorially bounded and corporations free-moving entities. Corporations engage in politics more directly through lobbying and funding political parties. This is particularly true in the US, where electoral campaigns are routinely funded by donors primarily drawn from business (Fuchs 2007). This can create a delineated area of corporate authority, such as corporations running immigrant detention facilities, but it also ties these corporations to the state. G4S, for example, which runs Manus Island for the Australian government, has numerous contracts with governments around the world. The greater the involvement a firm like G4S has in running detention centers and other governmental functions, the more expert and legitimate its views may appear to those governments. This will shape some big decisions, such as whether violence by a

detainee is treated with confinement and loss of privileges or by providing social care. G4S’s desire for profit may in turn shape its choice of recommendations. Finally, powerful corporations have numerous means to evade accountability, primarily based in the power imbalance between corporation and victim, through the use of Strategic Litigation Against Public Participation (SLAPPs), used to silence critics, and the use of legal waivers to avoid liability.

Finally, corporations have power over knowledge and norms within human rights (O’Kelly 2019). This is epistemic influence over how human rights are understood, the form and scope of business responsibilities, and the role of corporations within global governance. This works along numerous lines, from corporations distancing themselves from certain responsibilities – such as unions – to legitimizing themselves as activist voices through support for certain civil rights causes. It also includes acting as partners through funding and lobbying at global governance institutions such as the UN. Assuming corporations may have specific self-interested priorities dictated by shareholder value, it may follow that corporations engaging in human rights discourse are motivated by a desire to help in ways that improve, or at least do not harm, their profits. Greater corporate involvement in human rights discussions may therefore lead to a redirecting of human rights priority that follows profit-oriented maxims.

The purpose of this framework is both to understand how corporations influence human rights and to help develop the field of BHR beyond the most egregious and overt acts of business wrongdoing. It is hoped that the framework may be useful in developing future BHR-related regulations and laws, such as the BHR treaty that is under discussion (Bernaz 2021), and in improving analysis of the more structural elements of business control of human rights.

## Corporate Psychopaths

Clive R. Boddy  
Tasmanian School of Business and Economics,  
University of Tasmania, Hobart, TAS, Australia

## Synonyms

Aggressive narcissists; Executive psychopaths; Industrial psychopaths; Machiavellians; Organizational psychopaths; Political psychopaths; Primary psychopaths; Sociopaths; Successful psychopaths

## Definition

Corporate psychopaths are herein defined as unconscionable, ruthless, predatory managers who are driven by self-interest and avarice. However, although encyclopedia definitions are supposed to be definitive, it is important to bear in mind that designations of personalities such as psychopaths, Machiavellians, and narcissists are man-made definitions which are emergent, contested, and have been subject to conceptual drift. They are not naturally occurring genera in the real world like mice and rats whose mammalian similarities and species-specific differences can be examined and reported on.

Furthermore, over time, the names Machiavellian, narcissist, and psychopath have become to some extent just different labels for the same people. For example, McHoskey, Worzel, and Szyarto described, in 1998, a measure of Machiavellianism as being a global measure of psychopathy and especially of primary psychopathy, while Falkenbach, Howe, and Falki reported in 2013 that extreme narcissism is psychopathic in nature. Furthermore, researchers into aspects of one of these nominal groups or the other may not be aware of the existing literature on the other groups and therefore not be familiar with the amount of conceptual and behavioral overlap there is between them. This is even more obfuscated by the differences in terminology used within psychopathy research itself. Thus, this is an area where definitional differences need disambiguating.

Psychopaths have impaired physical connectivity and chemistry in the emotional areas of the brain, and these are associated with an uncaring, callous, and unemotional attitude toward others (Blair et al. 2005). However, several leading psychopathy researchers have concluded that there is compelling support for a distinction between subtypes of psychopathy.

Primary psychopathy closely mirrors Cleckley’s original characterization (Cleckley 1941/1988) of what a psychopath is and they can be regarded as socially dominant extroverts with low anxiety. Many of the characterizations and measures of psychopathy closely correspond

with Cleckley's account, and it is still recognized as the most authoritative account of psychopaths in society.

Primary psychopaths exhibit prototypical traits such as charm and grandiose self-importance. They are more deliberative and display a more calculating approach to life than the impulsive secondary psychopaths do. Secondary psychopaths, on the other hand, are more aggressive, anxious, and more impulsive.

Corporate psychopaths can be defined as those psychopaths – ruthless people with no conscience or empathy – who work in the organizational or corporate sector as opposed to their more violent criminal peers. The term “corporate psychopath” was, in part, a term utilized to differentiate between criminal and noncriminal psychopaths in people's minds. Babiak pioneered the way in this differentiation with his study of what he then called an industrial psychopath (Babiak 1995). Historically psychopathy and criminality were assumed to be almost synonyms because they were so often studied together in the form of criminal psychopaths in prisons, and so it was important to make this distinction. Psychopathy researchers have compellingly argued that the criminal elements often found in psychopathy were correlates or consequences rather than core elements of psychopathy (Cooke and Michie 2001).

Socioeconomically disadvantaged psychopaths appear to follow a criminal career trajectory while those with educational and family background advantages may be more attracted to corporate careers. After some differences in the nomenclature involving terms such as “executive psychopaths,” “industrial psychopaths,” and “organizational psychopaths,” this latter group of psychopaths have come to be called corporate psychopaths.

Corporate psychopaths correspond to definitions and descriptions of primary psychopaths or successful psychopaths, and antisocial, criminal psychopaths correspond to definitions of secondary psychopaths. Corporate psychopaths appear to be suave, successful, and competent, they dress to impress, and this misleading appearance

easily dupes the unwary. Nonetheless, in reality, corporate psychopaths are ruthless, conscience-free managers who are motivated by personal greed. Their desire for money and control straightforwardly triumphs over morality, organizational codes of conduct, human rights, and legal boundaries.

## Description

Corporate psychopaths have been identified as perhaps the most significant threat to ethical corporate behavior around the world. In line with this viewpoint, a senior UK psychiatrist called de Silva has argued that in order to help organizations avoid the adverse effects of having psychopathic people within them, leadership development should include learning the art of managing psychopathic employees.

As careerists with few distracting emotional interests (e.g., toward friends, family), an interest in working in finance and an unethical approach to business and to corporate social responsibility, corporate psychopaths are logically to be found in employment within any large organization. Further, with the increasingly fast movement of personnel and the concomitantly shallow processes involved in recruitment and selection, there is a compelling argument that corporate psychopaths are increasingly appointed to senior positions. They gain promotion and advancement because of their willingness to lie about their qualifications and achievements, and because their cool, unflappable characteristics make them appear rational and trustworthy.

## Who Experiences Corporate Psychopaths?

In general, Boddy's evidence from research in 2008 to 2011 suggests that about 6–11% of employees are currently working with a manager or supervisor who recognizably displays many of the characteristics of a psychopath. Additionally, in general management, about 32% of people

have ever knowingly worked with a corporate psychopath. However, this appears to be higher among HR professionals and auditors. Indications from research are that around 70% of HR directors have come across corporate psychopaths, while recent research reported on by Jeppesen, Leder, and Futter in 2016 establishes that 69% of auditors have ever experienced corporate psychopaths in their client management careers.

### **What Experiences Do Corporate Psychopaths Engender?**

According to writers like Perri and Clarke, fraud has long been theoretically associated with corporate psychopaths, and recent research indicates that of those auditors who have experienced corporate psychopaths in their client management careers, 43% reported that those auditors committed fraud. They are also expected to be involved in other forms of white collar crime. Australian research in 2008 involving a general sample of managers concluded that around 26% of all bullying is accounted for by the 1% of the employee population who are corporate psychopaths. Research in the UK, among a more closely defined sample of managers, found that 35% of all workplace bullying was associated with the presence of psychopathic leaders. Recent UK research suggests that these figures may be underestimates.

### **What Are Some of the Consequences of Working with Corporate Psychopaths?**

#### **Reduced Job Satisfaction**

Psychopathy correlates with reduced job satisfaction to the extent that corporate psychopathy has been found to be the main determinant of reduced job satisfaction in the workplace (Boddy and Taplin 2016). Job satisfaction is destroyed because the toxic environment created by psychopathic workplace leaders undermines any sense of employee enjoyment, commitment, or engagement.

#### **Reputation Declines**

Declines in corporate reputation can be expected when leadership are psychopathic or perceived as psychopathic. Corporate psychopaths through their direct action and via their example to others undermine some of the key drivers of corporate reputation such as good communications, managerial competence, job satisfaction, and corporate social responsibility.

#### **Redundancies**

Employees who work under or alongside corporate psychopaths become disillusioned at best and antagonistic at worst and vote with their feet to leave the organization. Employees intend to leave when faced with psychopathic leaders. Where psychopathic leadership is evident at the departmental level, then the entire staff of the department can leave the organization, while in case of psychopathic leadership at the organizational level, then the entire staff of the whole organization can exit the organization.

#### **Retribution**

Employees retaliate against the organization which subjects them to toxic and destructive psychopathic leadership by engaging in counterproductive work behavior such as sabotage and workplace production deviance. This reduces the productivity of the organization.

### **Psychopaths and Human Rights**

Psychopathy is intimately linked to human rights because the development of human rights has largely emerged in response to the callous, cruel, and inhumane behavior of leaders who displayed pronounced psychopathic traits. For example, the UK's King John was forced to sign Magna Carta after his cruelty and callous indifference to common standards of justice and his use of sexual coercion and torture, even among his peers, the nobility. Further the UN Declaration of Human Rights was made after and in response to the findings from the Nuremberg war trials involving senior Nazi party members. The three top Nazi leaders, Hitler, Hess, and Goering were all

diagnosed as psychopaths in 1933, 1941, and 1946, respectively, with the latter two being put on trial. Indeed, the whole Nazi government of that period has been described as being psychopathic in its cruelty and barbarism.

## Corporate Psychopathy

Clive R. Boddy  
Tasmanian School of Business and Economics,  
University of Tasmania, Hobart, TAS, Australia

## Synonyms

Corporate toxicity; Organizational psychopathy;  
Political psychopathy

## Definition

Corporate psychopathy is the condition whereby a corporation acts in a ruthless, uncaring, self-interested, conscience-free manner with respect to its employees, other people, and to the wider society in which it operates. Corporate psychopathy is marked by a callous lack of care or concern for the feelings of others, an incapacity to maintain enduring relationships, a reckless disregard for others' safety, an incapacity to experience guilt and well as deceitfulness, and repeated lying and conning others for profit together with a failure to conform to social norms with respect to lawful behavior (Bakan 2004; Achbar 2003). The psychopathic corporation acts irresponsibly, harms the environment, damages employees, and places customers and society at risk in its attempts to fulfill its goals of profit maximization. It accepts no responsibility for its actions and has no regrets or empathy.

## Description

This idea that a firm can be psychopathically ruthless, manipulative, remorseless, and self-interested in its actions has been recognized at least since 1985 (Daneke 1985). Drawing from Cleckley's work on psychopaths in society (Cleckley 1941/1988), Daneke refers to the "sociopathic firm" and so is clearly using the word sociopathic as being synonymous with psychopathy. Like Bakan, below, Daneke quoting Edmunds and Letey, recognizes that the firm is a "creature of the state" operating within traditions of jurisprudence and working within a limited, short term, profit-oriented view of its own existence, which means that the potential for corporate psychopathy is widespread (Daneke 1985).

Daneke largely discusses this from a social learning perspective rather than a legal perspective and while Daneke does not overtly report that as the firm is a creature of the state it can be modified by the state, logically it is implied in the discussion.

There are at least two circumstances where a corporation can be psychopathic. Firstly is the case where a (typically western) corporation is psychopathic because of its constitution and legal status. Senior organizational leaders and managers may take an exclusive orientation toward profit orientation at face value and operate as if nothing else matters. This is the case implied by Daneke and more elaborately set out by Joel Bakan in his book and in the documentary that was based on the book (Bakan 2004; Achbar 2003). Bakan further elucidates this viewpoint in a recent interview wherein he states that such a corporation is self-interested to the extent of being pathologically committed to the pursuit of profit and power.

The key point that Bakan makes is that corporations are a product of state regulation. Therefore society, through government and the law-making process, can change the way in which corporations are legally defined so that the element of psychopathy is removed from the genetic makeup of corporations. As a society we have the ability to control, create, and constitute corporations in a manner that corresponds more with how we want them to behave, which can generally be more in line with serving the broader public interest rather than merely the interests of the owners of the corporation.

Objectors to Bakan's thesis argue that it is too extreme a view and that in practical terms there is always a plausible rationale which managers can find for engaging in socially responsible corporate activities (Lee 2005). Lee argues, for example, that law courts are loath to interpret what constitutes sound management practice and a profit maximization policy. In practice, this means that corporate managers have considerable leeway in engaging in things like caring, nonruthless, non-psychopathic behavior such as corporate social responsibility. In other words, responsible management is the decision of individuals within corporations and it is those individuals – albeit operating within the norms of a corporate culture – who decide on corporate actions. Thus, managers have the opportunity to mitigate or avoid

potentially ruthless and psychopathic corporate behavior. However, this view of Lee's assumes that managers have a degree of moral autonomy and sovereignty from authority rather than being rule followers and unfortunately this sort of independence is often not displayed, as the literature on obedience clearly demonstrates.

The second case in which corporate psychopathy can occur is when corporate psychopaths (also known as primary psychopaths, successful psychopaths, executive psychopaths, industrial psychopaths, organizational psychopaths) have taken over the leadership of a corporation or other type of organization. In this case, the corporation's aims are subverted and realigned toward the pathological pursuit of wealth, prestige, honors, and power for the individual corporate psychopaths rather than for the corporation (Boddy 2015). This can involve fraud, subversion of organizational aims, and extensive mismanagement. The long-term well-being of the organization is put at risk in this case as the examples of Enron (see the entry on the Enron Scandal) and the Mirror Group delineate.

The remedy for this second situation is to closely manage, ethically supervise, or just remove the corporate psychopaths before they can undertake too much damage through their immoral and self-interested behavior. However, rather than firms keeping psychopaths from sensitive appointments there is evidence that psychopaths have been deliberately recruited into organizations (e.g., corporate banking and media) rather than excluded. Their presence in corporate banking has been associated with the events leading up to the global financial crisis.

For a further description of what occurs under the leadership and management of corporate psychopaths, see the entry on Corporate Psychopaths.

## Corporate Punishment

J. Angelo Corlett  
Philosophy & Ethics, San Diego State University,  
San Diego, CA, USA

## Introduction

“Corporate punishment” is ambiguous and thus requires clarification. By “corporate” is meant legal businesses which satisfy the conditions of what constitute corporations according to law. However, at least for purposes of punishment, there is a dualistic feature to corporate punishment. For not only are there corporate-collective entities but corporate individuals who are also sometimes subject to legal punishment, normatively speaking. This discussion of corporate punishment assumes that whomever/whatever is to be punished must satisfy the conditions both necessary and jointly sufficient for corporate responsibility (liability to punishment). Here it is implied that a theory of corporate punishment (about who or what ought to be punished) requires, among other things, a theory of responsibility (liability to

punishment) because it is the latter which forms the basis for the former. By “punishment,” is meant hard treatment and the denial of certain kinds of rights and freedoms, though not of course due process rights. This is an article on the ethics of corporate punishment and some vitally related issues.

## Is Corporate Punishment Morally Justified?

There are competing approaches to the justification of corporate punishment, ethically speaking. There are negative and positive approaches to corporate punishment. Corporate punishment abolitionism denies that corporations or their respective individuals ought ever to be punished, either because the conditions of responsibility (liability) are never or can never be satisfied so it would be unjustified to punish them or because any system of corporate punishment will be fraught with unfairness. One problem with such an approach is that it rests on a dubious and controversial metaphysic with regard to the question of whether or not corporate collectives and corporate individuals act with sufficient freedom that they might satisfy the conditions of corporate responsibility. If either metaphysical compatibilism or libertarianism is plausible, then the hard deterministic metaphysic underlying corporate punishment abolitionism renders it highly problematic in that considerations of corporate responsibility, proportionate punishment, and desert are completely ignored without adequate justification. It is worth noting, however, that hard determinism is not accepted as being plausible by most philosophers working in moral responsibility theory during the past century (Fischer and Ravizza 1988) or throughout the history of philosophy for that matter. So this path to support corporate punishment abolitionism is highly implausible. That a system of law which seeks to punish responsible corporate individuals and corporations themselves duly found guilty of this or that crime is sometimes unjust is

hardly a sufficiently good reason to reject an imperfect legal system that usually gets justice right in terms of punishing corporate harmful wrongdoing. Abuse does not nullify proper use of a practice.

On the other hand, there are those theories which favor the punishment of those guilty of corporate harmful wrongdoing. These are referred to as “positive” theories of corporate punishment, as opposed to corporate punishment abolitionism which is a negative theory of punishment. Among such positive theories is a classical utilitarian approach according to which punishments ought to be meted out to corporations and their relevant individuals in such a manner that the punishment rehabilitates guilty corporations and corporate individuals and/or deters others such that social utility is maximized. However, one difficulty with this approach is that it ignores what a guilty party deserves in terms of punishment, thereby ignoring considerations of corporate responsibility for the harmful wrongdoing of others. It also fails to comport with considerations of proportionate punishment in light of the harmful wrongdoings corporate collectives and corporate individuals commit. That deterrence of corporate harmful wrongdoing is of course a good thing can never replace desert as the fundamentally primary reason to justify legal punishment of any kind. Rehabilitation of corporate harmful wrongdoers is not in fact a form of punishment at all and so must be rejected as a category error when it comes to matters of corporate punishment. Hard treatment is not rehabilitation as these categories are properly construed and neither is rehabilitation hard treatment. Thus, utilitarian approaches to corporate punishment must be rejected as inadequate.

Another such approach to corporate punishment is the retributivist one wherein corporations and their individuals who are duly found guilty of harmful wrongdoings are punished insofar as they deserve it, that is, to the extent that they are responsible (liable) for punishment in approximate proportion to the amount of harm they cause to others. As secondary justifications of such punishment, deterrence and rehabilitation

might be relevant considerations. But desert is always the necessary and sufficient condition of morally justified corporate punishment. One objection to this retributivist model of corporate punishment is that the idea of desert is problematic, too intuitive, or primitive to serve as a meaningful criterion of punishment. However, when desert is explained in terms of proportionate punishment and responsibility, it becomes less mysterious and more plausible (Corlett 2014). A second concern with corporate punishment retributivism is the difficulty with respect to calculating proportionate punishment. But not only does the problem of proportionate punishment also face the utilitarian model of corporate punishment, it appears as though said difficulty is most problematic for an exact version of retributivism. Yet there seem to be no respectable philosophers or ethicists who hold that corporate punishment must be exacting. For punishment in any sphere of life is more of an art than a science. This makes the problem of proportionate punishment less of a serious one for matters of corporate punishment, whether retributivist or utilitarian.

What is more important than exact corporate proportionate punishment is approximate hard treatment. For a theory of corporate punishment as a general theory of punishment must take the world as it is, not as the manner in which some utopian philosopher thinks it ought to be quite aside from the way the world really is. Institutions, like punishment, cannot rightly be rejected simply because they are imperfect. They must be reformed in order to function as well as possible. But that they are somewhat unjust is no good reason to reject them. Instead, it is a good reason to reform them.

## Methods of Corporate Punishment

However corporate punishment might be grounded in ethics, there are a variety of ways in which corporate punishment might be meted out. One suggestion is the “Hester Prynne Sanction” (French 1984). According to this method, a

corporation found guilty of harmful wrongdoing is to suffer a court-ordered institutionalized form of adverse publicity [sometimes referred to as the “adverse publicity sanction” (Corlett 2014)], the cost of which is borne by the guilty corporation. However, the adverse publicity of corporations guilty of gross forms of wrongdoing would hardly suffice as an adequate punishment for the said corporations, and it also leaves those corporate individuals most responsible for said wrongdoings unpunished (Corlett 2014). Thus, while the adverse publicity sanction (coupled with fines) might do well in punishing some relatively minor or moderate-level corporate untoward events, it does not adequately address gross forms of corporate wrongdoing.

A more holistic retributivist approach to corporate punishment includes not only adverse publicity of the corporate entity guilty of serious harmful wrongdoing but also the seizure of the personal assets of all corporate individuals most directly responsible for the said harmful wrongdoing and the imprisonment of the said individuals in addition to the adverse publicity of the said corporate entity (Corlett 2014). Indeed, what this approach suggests is that all guilty and primarily responsible corporate individuals are to be stripped of their personal assets in proportion to their roles in causing the harmful wrongdoing in order to compensate those damaged by the corporate harmful wrongdoing prior to the corporation itself being fined in order to cover any remaining damages owed to victims. Subsequently, those corporate individuals and corporate entities themselves ought to be adversely publicized, and each guilty party should bear her responsibility in paying for the costs of the adverse publicity. The elimination/revision of corporate limited liability laws in the United States of America is morally required for this approach to have the secondary deterrent effect that would likely obtain throughout the US business communities. In cases of major corporate harmful wrongdoing wherein criminal negligence leads to the deaths of humans and/or nonhumans, capital punishment of those corporate individuals most responsible for the crimes should be considered by the law in some cases. For the negligent, gambling with the lives

of others ought not to come absent a heavy price to pay for such creation of an unreasonable risk of such serious wrongful harm to others (i.e., negligence<sup>1</sup>). Thus, corporate-individual fines of those corporate individuals most directly responsible for the serious corporate harmful wrongdoing coupled with corporate-collective fines may serve as compensation for major corporate harmful wrongdoings, and adverse publicity sanctions may also serve the goal of justice when the harms are so serious that no amount of compensation is likely to adequately compensate those who are wronged.

How is it determined which corporate individuals are most responsible for serious corporate wrongdoings deserving of harsh treatment and compensatory fines? One element of corporate-individual responsibility is the power to effect meaning change (French 1984). To the extent that a corporate individual has significant power to effect meaningful change and is also guilty – in full or in part – of committing, attempting to commit, or omitting to act (as the case may be) a harmful wrongdoing qua member of the corporation, she is liable to harsh treatment and compensatory fines in order to rectify that wrongdoing.

One objection to a retributivist approach to corporate punishment is that it is likely to have a deleteriously deterrent effect on capitalism in general and on corporate capitalism in particular. Few, if any, businesspersons would want to participate in corporate affairs if they can be held personally liable for their harmful wrongdoings – especially for their serious ones that could bankrupt them as individuals and even sentenced to prison or even death as the case may be. This would likely eventuate in the end of capitalism as we know it.

In reply to this concern, it must be pointed out that it appears to assume that capitalism functioning normally entails widespread corporate harmful wrongdoing. But this assumption is dubious, and until it is substantiated, it ought to be abandoned. On the assumption that a sufficient number of businesspersons can and will function

---

<sup>1</sup>This definition of “negligence” is found in Feinberg (1970).

reasonably well and are willing to take the risks of capital gain, there is a reason to think that the proposed retributivist system of corporate punishment will, as capitalism purports to do, reward and punish those in the corporate world as it should. And on the assumption, on the other hand, that insufficient numbers of businesspersons will be able to fill the corporate world to make capitalism function well, then perhaps capitalism is a socio-economic system that is at fundamental odds with ethics, properly construed. So either capitalism properly construed can in both principle and in practice function sufficiently ethically to justify retributivism as a model of corporate punishment grounded in respect for responsibility, desert, and proportionate punishment, in which case retributivism can bring justice to rights violations under capitalism or capitalism must be rejected on moral grounds because it cannot possibly satisfy the basic requirements of justice, namely, in providing approximate justice and rectification to those harmed under it. So in a best case scenario for capitalism and corporate punishment, retributivism can serve as the watchdog over corporate harmful wrongdoings. In a sense, then, retributivism is what can in some sense help to “justify” capitalism (assuming that capitalism can be justified at all) as it serves to correct capitalist harms, such as corporate ones, whether those harms be those of the deadly and maiming toxic chemical leak by Union Carbide (now Dow Chemical) in Bhopal, India; the Exxon oil spill environmental disaster in Prince William Sound, Alaska; the British Petroleum oil environmental disaster in the Gulf of Mexico; the massive US-based business, including corporate support for the morally unjust military invasion of Iraq in 2003; etc. Or, as others might want to put it, retributivism might well end up serving to expose the fundamentally unethical nature of even the most morally attractive version of capitalism. Whichever the case, retributivism proves to be the most promising of the approaches to addressing corporate harmful wrongdoings. Deterrence and/or rehabilitation are highly inadequate ways of addressing serious corporate wrongs, and abolitionism is not serious about addressing them in the first place as it cloaks itself

in the moral garb of pacifism, moral cynicism, and/or utilitarian disrespect for compensatory rights and the duty to punish legal offenders.

## Conclusion

Once “corporate” and “punishment” were defined at least in general terms, various general approaches to corporate punishment were explored, however, briefly. Some objections to each approach are explored in terms of some real-world considerations. The matter of corporate punishment requires further exploration in both ethics and business, for ethics must determine the moral boundaries of the corporate world if capitalism is to have a moral foundation at all, yet ethics must be well informed by business as it functions in the real world so that ethics does not lapse into a practice of a relative few academics who in their utopian splendor engage in “talkin’ loud and sayin’ nothin’” worthwhile.<sup>2</sup> In the meantime, if their speculations and dismissiveness of positive attempts to address corporate punishment are taken seriously, there is no answer possible to the myriad of harms wrongfully caused by corporate collectives and some of the respective corporate-individuals. But while business must, if it is to be palatable, be informed by the best ethics has to offer, ethics itself must be informed by the real world of business, including the corporate world, if it is going to offer sound moral discourse concerning matters of business, including corporate punishment.

## Corporate Social Responsibility

Colleen Hayes

Research School of Accounting, Australian National University, Acton, ACT, Australia

### Synonyms

Corporate social performance

### Introduction

There is no universally agreed upon definition of corporate social responsibility. Opinion is largely divided according to whether a corporation's social responsibility is to maximize profits for shareholders (*shareholder primacy*) or whether it extends to serving the interest of any entity that is impacted by (impacts upon) the firm's activities. The competing views of the social responsibility of corporations are referred to as the *shareholder* and *stakeholder* views, respectively. However, more recent developments reflect a convergence of the competing views, where value for shareholders may be best served by taking into consideration the interests of other stakeholders.

### Discussion

The nature and scope of a corporation's social responsibility is underpinned by the relevant traditional corporate governance model. In the Anglo-American (UK-US) tradition, a public corporation is viewed as a fiduciary relationship between shareholders (principal) and managers (agent), which gives rise to the *shareholder* view of a corporation (see "► [Agency Theory](#)"). The relationship is marked, inter alia, by profit-oriented behavior and, traditionally, widely dispersed ownership that separates ownership and control, leaving management as a largely uncontested decision-maker. The *shareholder* view of the firm holds that management's primary

responsibility is to maximize the wealth of shareholders by maximizing the value of the corporation. However, it is important to note that society also gains from profitable corporations, as they, for example, create employment, provide goods and services, and pay corporate taxes.

The traditional Continental European corporate governance model, on the other hand, takes a multiple *stakeholder* view of the firm, which includes the interests of shareholders and other stakeholders, such as employees.

The competing views of a firm gained prominence in the US political and economic landscape in the 1930s with the Berle-Dodd debate and are, in turn, reflected in the competing views of the social responsibility of corporations. In 1932 Dodd argued that "public opinion ... is today making substantial strides in the direction of a view of the business corporation as an economic institution which has a social service as well as a profit-making function" (1148). In the 1960s Frederick (cited in Carroll 1999: 271) maintained "social responsibility ... implies a public posture toward society's economic and human resources and a willingness to see that those resources are used for broad social ends and not simply the narrowly circumscribed interests of private persons and firms." Friedman (1970) on the other hand maintains that "there is one and only one social responsibility of business ... to use its resources and engage in activities designed to increase its profits." The *stakeholder* view, associated with Freeman (1984), holds that corporations should take not only shareholders into consideration but also other stakeholders such as employees, consumers, creditors, and local communities.

A *stakeholder* is defined as "any group or individual who can affect or is affected by the achievement of the organization's objectives" (Freeman 1984: 46). Stakeholders include those who are fundamental to the survival of a firm, for example, investors, customers, suppliers, employees, and government, and other entities who are not fundamental to the survival of the firm but have the capacity to adversely impact a firm's reputation, for example, NGOs, the media, and the public at large (Clarkson 1995).

Stakeholders are in that context “persons.” A matter for consideration here is the debate surrounding the stakeholder status of the natural environment (Starik 1995). To that end, in 2017 the New Zealand and Indian governments granted stakeholder (personhood) status to the Whanganui and Ganga and Yamuna Rivers, respectively.

Jensen (2002) highlights the difficulties faced by management in striking a balance between the competing interests of disparate stakeholders and argues the case for “enlightened value maximization” as the key to establishing “the proper relation” between value maximization and stakeholder theory. Enlightened value maximization involves utilizing “much of the structure of stakeholder theory but accepts maximization of the long-run value of the firm as the criterion for making the requisite tradeoffs among its stakeholders, and specifies long-term-value maximization ... as the firm’s objective” (Jensen 2002: 235).

There is no universally agreed upon definition of corporate social responsibility. However, in the ethos of the stakeholder view, as the following definitions suggest, the notion of CSR extends to pursuing social good:

[CSR] refers to the obligations of businessmen to pursue those policies, to make those decisions, or to follow those lines of action which are desirable in terms of the objectives and values of our society. (Bowen 1953 cited in Carroll 1999: 270)

Bowen’s reference to CSR meeting the “objectives and values of our society” invokes *social contract theory*. Social contract theory considers that corporations are artificial entities created by society to meet its needs and that an organization’s *license to operate* relies on it acting in a manner that society deems to be socially responsible, which is, in turn, key to an entity establishing its social *legitimacy*. The capacity for society (stakeholders) to impact the social agenda of corporations is demonstrated, for example, in the Shell–Brent Spar incident in 1995. Shell in full consultation with the UK government sought to dispose of the “Brent Spar” oil rig in the North Sea. Greenpeace objected to the plan and utilized the media to bring the issue to the attention of the public at large. Greenpeace was supported

by North European governments, including Germany and the Netherlands. Further, there was a substantial consumer boycott of Shell products, e.g., a 20% drop in sales in Germany. Given the stakeholder backlash, Shell maintained that it was in an “untenable position” and abandoned the plan.

As the Brent Spar incident indicates, acting within the law is not a sufficient condition for a corporation to discharge its social responsibility, instead CSR extends to “concern for the ethical consequences of one’s acts as they might affect the interests of others” (Davis 1967 cited in Carroll 1999: 272). To that end, Carroll (1991: 43) identified the following four principles of corporate responsibilities: “to make a profit, obey the law, be ethical, and be a good corporate citizen.” Good corporate citizenship is often associated with philanthropic activity. The four responsibilities are typically depicted as a pyramid. Criticisms of the model, however, led to it being replaced by a three-domain (economic, legal, and ethical) Venn diagram model (Schwartz and Carroll 2003).

Heal (2004: 12) defines CSR as “taking actions which reduce the extent of externalized costs or avoid distributional conflicts.” The negative externalities to which the author refers are manifestations of market inefficiencies, which accrue where there is a divergence between private and social costs. Social costs are borne by humanity and the environment, not the private entities involved in the market-based activity. In the context of CSR, negative externalities are manifest in the form of the loss of human welfare (e.g., to health, esthetics, and recreation) and the pollution of natural resources (e.g., water, land, and air) and the loss of nonrenewable resources and biodiversity. Sir Nicholas Stern maintained that “climate change is a result of the greatest market failure the world has seen.” The threat to ecosystems goods and services is attributed to the failure of industrial capitalism to value *natural capital*, that is, “the biological world whose resources and ecosystems services make all life possible” (Lovins 2004: 3). The distributional conflicts to which Heal (2004: 10) refers are manifest in the form of, for example, the use of “child labor” and “low wages for

adults” in developing countries. Reducing the “extent of externalized costs” is consistent with the notion of *sustainable value creation*, which questions the traditional shareholder primacy perspective of wealth creation to the extent that it emphasizes short-termism at the expense of the long-run value of the firm. Sustainable value creation calls for “all relevant costs and benefits” – economic, social, and environmental – to be “accounted for, rather than simply externalized” when deciding on a project (Fatemi and Fooladi 2013: 106), due to the development of creative mechanisms for settling up and changes in the capital market.

The threat to ecosystem’s goods and services has given rise to the concept of *sustainability* which recognizes that “we are approaching, and in some cases surpassing, the limits of our planet’s resources and carrying capacity” (United Nations Environment Programme 2013: 6). The major drivers of the imbalance are human population growth and economic development. The threat to natural capital has also led to the notion of a *sustainable system of production*, that is, one that “meets the needs of the present without compromising the ability of future generations to meet their own needs” (United Nations 1987). *Sustainable development* is typically associated with living within the limits that society can provide and the equal distribution of resource opportunity (*social justice*) (United Nations 1987). However, sustainable development also extends to the preservation of *social* and *cultural capital* (Lertzman and Vrendenburg 2005: 240).

Following the preceding discussion, CSR-related actions include providing a safe working environment for employees, ensuring product/service quality and safety, abating pollution, conserving biodiversity and natural resources, taking account of gender and minority interests, supporting local communities, and undertaking philanthropy. However, it is important to remember in the light of the events surrounding, for example, the 2008–2009 global financial crisis – marked, allegedly, by obsession with immediate gain, the inappropriate rating and overvaluation of financial instruments, compromised banking practices, and lack of transparency – that the

principle of ethics underpinning “doing good,” whether embodied in law or otherwise, ought also to be embedded in how a firm achieves its economic objectives.

*Corporate social performance* refers to how corporate actions rate against predetermined social criteria, such as the environment, diversity, employee relations, relations with indigenous people, and philanthropy. Formal evaluation of corporate social performance is undertaken by independent organizations using various non-financial social and environmental measures.

Examples of adverse social and environmental incidents include the following:

- **Bento Rodrigues 2015** On 15 November, 2015, the small Brazilian village of Bento Rodrigues was erased when an estimated 40–60 million cubic meters of contaminated copper tailings (mud) burst from a dam operated by Samarco, which is, in turn, owned by Vale SA and BHP Billiton. An estimated 17 people were killed and 16 injured.
- **Volkswagen 2015** In September, 2015, the US Environmental Protection Agency discovered that many Volkswagen cars being sold in the USA had a “defeat device” (software) in the diesel engines that could detect when the vehicles were being tested for emissions levels. The software changed the performance under the test conditions to improve results. Volkswagen conducted a major marketing campaign in the USA promoting its diesel cars as low emission. The car manufacturer has admitted to cheating the emissions tests. The company is potentially facing US regulatory fines and class actions from purchasers who face devaluation of their vehicles.
- **BP Deepwater Horizon 2010** On 20 April, 2010, the BP-operated Deepwater Horizon oil rig exploded, caught fire, and sank in the Gulf of Mexico. Eleven workers were killed and 17 injured. An estimated 40,000–60,000 barrels of oil per day spilled into the Gulf. The well was not declared “dead” until 21 September, 2010.
- **Exxon Valdez 1989** On 24 March, 1989, the oil tanker *Exxon Valdez* struck a reef in Alaska’s

Prince William Sound, tearing open the hull and releasing 11 million gallons of oil into the pristine environment.

- **Bhopal gas tragedy 1984** On 3 December, 1984, methyl isocyanate gas leaked from a plant owned, managed, and operated by Union Carbide India Ltd, in the Indian city of Bhopal. According to official statistics, between 15,000 and 20,000 people died and several thousand suffered disabilities, many of them permanent.

Friedman's (*shareholder primacy*) view of the social responsibility of business implies that business and society are not interdependent. The *business case* for CSR (Porter and Kramer 2006), however, seeks to overcome that tension. It calls for the integration of business and society, such that businesses invest in CSR activities that benefit society and enhance shareholder value (win–win scenario). The process of integrating business and society calls for prioritizing social issues and looking *inside out* and *outside in*, in mapping the bilateral social impact–social influence relationship.

Forces contributing to a shift in social expectations of corporate social responsibility from a shareholder to a stakeholder view include the following. First, the liberalization of governments, including the deregulation and the privatization of government assets, has led to business taking on responsibilities for activities previously the preserve of governments. Second, globalization, along with liberalization, has vested substantial wealth and international influence in the hands of multinational companies. To that end, the “social responsibilities of business men need to be commensurate with their social power” (Davis, cited in Carroll 1999: 271). On the matter of the social responsibilities of multinational companies, Kolstad (2007: 142) takes issue with the premise of the shareholder view of the firm concerning the “division of moral labour in which firms are assigned the task of maximizing profits, while the state is assigned the task of redistributing income and correcting market failures” in circumstances where the state is neither capable or willing to “perform the tasks assigned to it.” In that case, Kolstad maintains that other agents,

including firms, have “secondary responsibilities” to ensure the tasks are carried out. Third, the growth in socially responsible investment (SRI) in the capital market. Socially responsible investors take environmental, social, and governance (ESG) considerations into account when making their investment decisions. The approaches utilized by socially responsible investors to influence investment decisions involve *screening*, *advocacy*, *community investing*, and *social venture capital*.

## Corporate Social Responsibility and Domestic Violence

Alice de Jonge

Department of Business Law and Taxation,  
Monash Business School, Monash University,  
Caulfield, VIC, Australia

### Introduction

This entry begins with a brief description of two phenomena of twenty-first-century societies: the persistent problem of domestic violence and the dissolving boundaries between home and work. The entry then discusses the challenges these two phenomena present for ethical reasoning about corporate social responsibility in relation to employees affected by domestic violence. A number of ethical frameworks for understanding these challenges are discussed. The final section of this entry focusses upon six specific

questions for businesses to ask when addressing the impacts of domestic violence in the workplace: (i) the question of leave entitlements for workers affected by domestic violence, (ii) the challenge of dealing with privacy concerns, (iii) dealing with workplace safety issues raised by domestic violence, (iv) whether and how to establish a workplace support network for affected workers, (v) whether and how to provide counselling and referral services, and (vi) how to manage the enterprise relationship with wider society in relation to domestic violence.

### The Twenty-First Century: A Persistent Problem of Domestic Violence and Dissolving Boundaries Between Work and Home

The term “domestic violence” (also known as “intimate partner violence”) is defined here to include: “any incident or pattern of incidents of controlling, coercive or threatening behaviour, violence or abuse between those aged 16 or over who are, or have been, intimate partners or are family members. This includes: psychological, physical, sexual, financial and emotional abuse. It also includes ‘honour’-based violence and forced marriage” (NICE 2014: 1).

The cost of domestic violence, including the costs of lost productivity and of legal, health, and other social services, has been estimated at up to 2% of global GDP (The Economist 2018). The total cost to the US economy of the almost 5 million domestic violence cases recorded per year is about \$460 billion p.a. (Lomborg and Williams 2018). Domestic violence costs the UK an estimated £15.7 billion in 2008 (Walby 2004; NICE 2014: 3–4; ILO 2011). In Canada, a Department of Justice study estimated that domestic violence cost employers \$78 million in 2009 (Department of Justice 2016).

In Australia, New Zealand, and Canada, growing awareness of the persistent prevalence of domestic violence has prompted Royal Commissions and taskforce inquiries (Queensland Taskforce 2015; Victorian Royal Commission into Family Violence 2016; Andrews 2015), and legislative initiatives to incorporate domestic

violence leave entitlements into workplace standards. Yet overall throughout the Western world, funding cuts to social services mean that fewer victims of violence have access to support, while rates of domestic violence continue to rise or remain persistent (Leins 2015; CDC Survey 2015; Bureau of Justice statistics 2013; Murray and Theobald 2014).

Domestic violence impacts on the workplace in a number of ways. First there are the costs of lost time and productivity of employees who are dealing with the impacts of domestic violence. Second, there are the impacts on fellow workers when a violent partner follows the affected worker into the workplace, creating a safety incident, or when the affected employee arrives at work injured, distressed, and/or fearful – even seeking to use the workplace as a refuge after hours (Murray and Powell 2007, 2008; Wathen et al. 2014).

Other issues arise when it is the violent partner who is an employee. Such employees can bring violence into the workplace. They can use workplace time and resources to facilitate stalking and/or abusive activities. They are more likely to be absent or underperforming (Murray and Powell 2007, 2008; Walden and McFerran 2014; Trade Union Council 2014; Wathen et al. 2014).

The changing nature of the modern workplace means that the impacts of domestic violence can no longer be ignored. The workplace and the domestic environment can no longer be treated as discrete or separate environments (Ericson 2013; Woods 2012; *Workplaces Respond*). As the proportion of women in the workforce increases across the developed world, policy-makers and businesses are increasingly forced to recognize that their employees have obligations as parents, carers, and partners (Skinner and Pocock 2014). Family-friendly policies are altering workplace practices and even the workplace physical environment (such as when creche, day-care, and/or baby-care facilities are provided) everywhere (Albrecht 2003; Wajcman 2002; Skinner and Pocock 2014). Domestic violence is an unfortunate aspect of family life for many employees, and failure to address its impacts in workplace policies discriminates against those affected.

Just as the workplace is altering to incorporate domestic concerns, so also the domestic environment is adjusting to workplace demands (Pearson and Seyfang 2002; Ericson 2013; Bardoel 2012). Daily family routines are tailored around workplace needs, especially disruptive when shift-work is involved. Telecommuting turns the home into a workplace, and the physical space is altered accordingly (Ericson 2013; Woods 2012; Bardoel 2012). While telecommuting provides greater flexibility, it also means that the home is no longer a place free from workplace demands (Woods 2012; Ericson 2013; Bardoel 2012).

Modern communications technology can both facilitate domestic violence and be used to address it (Woods 2012). Abusers can use GPS and mobile phone technology to stalk their victim(s). Email and texting service can become transmitters of abusive messages (DVRCV website; Hand et al. 2015; Woods 2012). Yet modern technology can also be used to help victims seek help and decrease isolation (Woods 2012). Evidence collected via mobile technology can be used to bring abusers and stalkers to account. Communications technology can provide security for victims through emergency signaling (NNEDV 2014; Finn 2000).

### **The Expanding Scope of Corporate Social Responsibility: Ethical Reasoning About Corporate Responsibility in Relation to Domestic Violence**

As Scherer and Palazzo (2011) have noted, “under the conditions of globalization, the strict division of labour between private business and nation-state governance does not hold any more” (2011: 899). In recognition of this changing environment, “many business firms have started to assume social and political responsibilities that go beyond legal requirements” (Scherer and Palazzo 2011: 899–900). Employee welfare has at the forefront of this expanded area of corporate responsibility (Jenkins et al. 2002; Compa 2008; Flanagan and Gould 2003; Yu 2008; US Dept. of State Archive 2001–2009). The International

Labour Organisation (ILO) and Social Accountability International have led the shift toward international recognition of corporate responsibilities for employee welfare (SA8000 2014; Compa 2008). The OECD and the UN Human Rights Commission have led the move toward universal recognition that transnational businesses have a duty to respect human rights more generally (Ruggie 2008, 2010; UNHCR 2011). Individual companies have developed their own voluntary codes of conduct in relation to employee welfare (Compa 2008; Flanagan and Gould 2003; Pearson and Seyfang 2002). The question arises, however, of exactly how far the responsibilities of business for employee welfare should extend into what has traditionally been seen as the private sphere of domestic life.

Questions arising in relation to business responsibility for employee welfare have been discussed from a number of different philosophical perspectives. Sison and Fontrodona (2012), for example, draw upon three schools of thought to develop a conception of the common good applicable to the relationship between the corporation and its employees. From Aristotle, they borrow a general conception of the common good defined in terms of *eudemonia* – a shared human flourishing. From Aquinas, they adapt a conception of the common good to extend it beyond the broader social *polis*, to include the transnational corporation. From Catholic Social Thought (CST), Sison and Fontrodona (2012) borrow a multilevel way of thinking about the need for all social actors, including business organizations, to contribute to the common good. For Sison and Fontrodona (2012), combining these three perspectives highlight a view of the corporation as both able and liable to participate in working toward the common good of wider society. Yet this view has little to say about the extent to which the firm, as a shared enterprise, might be responsible for the flourishing of individual employees *outside* of the workplace. It is a perspective which, by emphasizing the common or shared nature of the corporate endeavor, tends to lose sight of the individual within it.

A social contract view (Rawls 1971, 2001) of corporate responsibility in relation to employee

welfare goes further toward addressing the needs and rights of individuals within the corporation and society. According to Bishop (2008), a social contract viewpoint respects corporate autonomy and the right of companies to pursue private purposes, but also places upon corporation concomitant responsibilities:

to respect the freedom and human rights of all people, and not to interfere with government programs that [provide] ... education ... and ... a safety-net that prevents destitution [as well as other] ... rights and responsibilities ... established by ... legitimate democratic processes. (2008: 191)

Examples of corporate responsibilities “established by legitimate democratic processes” include minimum wage legislation, occupation health and safety standards, and minimum award conditions and entitlements. Awards and Enterprise Bargaining Agreements (EBAs) exist in many jurisdictions as a primary forum for negotiating the relationship between the workplace and the domestic sphere. In an increasing number of jurisdictions, these entitlements now include, in addition to parental, carers’, and other leave entitlements, employee access to domestic violence leave (Schneiders 2012; UNSW Gendered Violence Research Network website). A social contract perspective, however, justifies and explains such provisions as essentially voluntary, with each side able to enter the pact in pursuit of self-interest.

Another perspective known as stakeholder theory combines both Aristotelian notions of the common good and social contract theory. According to Freeman (2008), stakeholder theory is based on the notion that “Businesses and executives are responsible for the effects of their actions. They are responsible precisely to those groups and individuals that they can affect or be affected by” (2008: 164). Freeman is critical of the tendency for corporate social responsibility discourse to fail at any attempt to define the boundaries of business’s responsibility for problems which are essentially social in nature. His answer is to draw the boundaries as far as “stakeholders” and no further (2008: n. 9).

Feminist theories provide another set of perspectives that (like Freeman) view employees not

as units of production, but as “whole, fully integrated human beings, with names, faces, families, and pasts ...” (Freeman 2008: 163). What the many different bodies of feminist thought share in common is an ethical criterion that places emphasis on the concrete reality of people’s lives (Ashcroft 2000, 2001; Phillips 2006; Wajcman 2002). A feminist lens thus becomes one through which the true impacts of domestic violence in the workplace can perhaps be most clearly understood. In particular, a feminist lens ensures that policy-makers do not lose sight of the fact that “Domestic violence is a gendered issue. ... the rate of domestic and family violence perpetrated against women is significantly higher than it is against men” (Queensland Task Force 2015: para. 2.3; see also Bureau of Justice Statistics 2013) and elsewhere in the Western world. Moreover, feminist reasoning, by paying close attention to social relations, serves to strengthen the foundations of modern democracy in a way that abstract notions of *eudemonia*, or individualistic notions of the social contract, cannot.

In the close attention it pays to the importance of social relations, feminist theory shares many of the same concerns as those shared by CSR scholars (Bishop 2008; Scherer and Palazzo 2011; Flanagan and Gould 2003; Compa 2008). As Albrecht explains:

Modern, democratic societies depend upon families to pass on traditions of meaning and value, to revalue these traditions in new generations, and to model and teach this generational process of becoming acting moral agents. Democratic societies depend upon ordinary citizens, as nature moral agents, to do the work of maintaining democratic communities and institutions. Ultimately, it is the purpose of both the products and processes of business to serve these foundations of individual and social wellbeing. (2003: 180)

Related to this is the way feminist scholars have exposed power relations within social structures. This is useful in creating awareness of the biases built into existing processes of negotiating, drafting, and implementing policies aimed at addressing domestic violence and its impacts (Phillips 2006; Wajcman 2002; Ashcroft 2000, 2001).

## Dealing with the Impacts of Domestic Violence in the Workplace: Issues for Business to Consider

Responding to domestic violence challenges by incorporating new practices and altering existing practices within the workplace involves risks and challenges for managers (Yuan et al. 2011). Diplomacy is required when consulting with stakeholders about change; and managerial skills must be called upon to ensure coordination across all relevant functions (Yuan et al. 2011; [Workplaces Respond website](#); Swanberg et al. 2005). No single set of “best practice” guidelines will apply to all workplace settings. But some questions are generally applicable to nearly all modern Western workplaces (ALRC 2012; Queensland Taskforce 2015; Phillips 2006; Wathen et al. 2014; Murray and Powell 2008). The first of these is the question of tailored leave entitlements for workers affected by domestic violence.

Australia, Canada, New Zealand, and the Philippines are among the countries where formal legislated entitlements to domestic violence leave for employees can be found. Each jurisdiction has its own combination of paid and unpaid leave entitlements, and there are important variations in levels of awareness, access, and enforcement (ALRC 2012; ILO 2011; TUC 2014). Even in these nations, it is business which must take the lead in providing genuine access to supported leave for employees affected by domestic violence. Supported leave means more than an entitlement to remain absent from work without penalty. It means that affected employees have access to financial entitlements and support services while they remain affected by a violent domestic situation. Affected employees need the ability to tailor, in consultation with the employer, the manner in which they access different entitlements and services according to their individual circumstances. For employers unable to provide immediate access to paid leave entitlements, an expanded definition of existing “special,” “family,” “flexible,” or other leave entitlements can be used as a first step.

Both parties bear rights and responsibilities in relation to the duty to consult. The affected

employee owes a responsibility to make their needs clear to the employer in so far as it affects existing workplace arrangements and to keep the employer informed as relevant circumstances change. The employer is responsible for ensuring that the employee has access to culturally appropriate consultation and other services, and a duty to protect the affected employee's right to privacy.

The right to privacy is one of the basic rights outlined in the *International Covenant on Civil and Political Rights* 1966 (Article 17). The employer's undertaking to keep employee personal information confidential is essential to the employee's dignity and security. The employee's undertaking to keep the employer informed of workplace-related circumstances is essential to the preservation of workplace routines and workplace security. An effective enterprise agreement consultation clause retains the balance between these demands.

For employee perpetrators of violence, privacy is also an essential part of facilitating disclosure and providing support in appropriate cases. Employee perpetrators assessed as being able to benefit from attending counselling/treatment are most likely to benefit if they are able to remain in the workplace. Guarantees of confidentiality are an important part of making this possible.

Integrating privacy as a routinized part of workplace practices may require investment in additional record keeping/communications infrastructure and human resources and forms an essential aspect of workplace safety. Where needed, managers need to be able to efficiently arrange new office premises, phone number, and/or email address, or even altered workhours, for employees affected by domestic violence. All employees need awareness training so that if an abusive partner seeks entry to the workplace (physically or virtually), the situation can be dealt with and so that staff are able to assist and refer affected colleagues where necessary.

In larger organizations especially, workplace safety is enhanced if a network of trained support staff is established throughout the workforce. A choice of contact points for affected employees is particularly important for culturally diverse workplaces. It also provides for a larger number

of referral points able to refer affected staff to appropriate external support services – medical, legal, migration, housing, and other social services.

In the case of employee perpetrators, the challenge for HR is to balance a zero-tolerance approach to domestic violence with a safe and supportive environment for rehabilitation and treatment where that is possible. Case-by-case assessments are desirable but costly. Clear guidelines setting out the obligations of perpetrator employee assessed as willing and able to benefit from counselling and/or treatment are essential, along with HR staff trained in their implementation.

"Positioning" refers to adding independent, peripheral CSR routines that may not exert much influence internally; but serve to facilitate linkages between an organization and the community within which it is located. When positioning strategies serve to generate working relationships between the firm and community service providers, this can evolve into what Yuan et al. refer to as "thickening" – making use of externally sourced services to enhance the effectiveness of workplace policy implementation (2011: 83).

A public commitment to opposing domestic violence is an important part of "positioning." It stands as a symbol and a message to both employees and the wider community of what the company stands for. As such, it needs to come from, and be endorsed by, the highest level of organizational authority. There must be a commitment to developing a supportive workplace in which victims of domestic violence can come forward for help and support (see, e.g., Brimbank City Council 2014; NAB Domestic Violence Policy 2011; City of Sydney 2011; Loddon Shire Council 2014).

A strong organizational statement condemning abusive behavior is an equally necessary part of addressing the impacts of domestic violence in the workplace. Such a statement provides a firm foundation for penalizing the misuse of workplace resources by perpetrators and for directing relevant employees to specific counselling and, where needed, treatment services.

A public commitment to addressing the causes and impacts of domestic violence also facilitates the sharing of experience and expertise with relevant community organizations, including unions, employer organizations, and local service providers. This requires investment of resources – an investment in the building of relationships of reciprocity and trust (Ashcroft 2001; D’Enbeau and Buzzanell 2013; Pearson and Seyfang 2002).

This entry has drawn upon major streams of ethical theory – Aristotelean ethics, social contract theory, and feminist thought – to explore the limits of corporate social responsibility in relation to domestic violence and its impacts. As with other aspects of corporate social responsibility, these limits will vary from organization to organization and from setting to setting. What is important is that the organization and its leaders be open to addressing the needs of domestic violence victims – for time away from work, for workplace flexibility (both temporal and physical), for protection of privacy rights, and for safety at work. Each of these needs can be realized most effectively when a workplace support network exists for affected employees to tap into, when counseling and referral points within the workplace have sound relations with relevant services outside of the workplace, and when there is a public commitment by the organization to act as a responsible member of society in combatting domestic violence.

Engineering Ethics and Corporate Responsibility

## Introduction

Despite obviously overlapping interests in promoting good behavior and public benefit, discussions of engineering ethics and corporate social responsibility (CSR) are seldom related. This entry argues the need to bridge the gap by briefly describing developments in the two fields and then suggesting role ethics as potentially able to combine their separate strengths to reduce their separate weaknesses. To what extent might CSR be a viable mediating contributor to engineering ethics and/or engineering ethics serve as a practical influence on CSR?

## Corporate Social Responsibility

Definitions of corporate social responsibility vary by industry, region, and historical era, and debates about the societal obligations of businesses are as old as businesses themselves. A key moment in the evolution of CSR was a turn in the 1960s and 1970s, when corporations broadened their focus on philanthropy and began to include pressing public issues such as urban decay, racial discrimination, and environmental pollution, and when stakeholder theory rose in prominence. By the twenty-first century, CSR and its related concepts, such as sustainability, sustainable community development, creating shared value, and conscious capitalism, were firmly ensconced in business schools, in business strategy networks, and corporate publications and outreach. Social scientists and activists generated rich empirical critiques of the actual practice of CSR by particular companies, leading many to consider the term greenwash. Various reporting mechanisms, international voluntary standards, and the ESG (environment – social – governance) movement have attempted to standardize how corporations collect and share information about their performance, but the focus of CSR activities and judgments of success largely rest with corporations themselves. The lack of definitional clarity leads some critics to claim that “the use of the term CSR

has become so broad as to allow for people to interpret and adopt it for many different purposes” and for businesses to “appropriate the meaning of ethics” (Blowfield and Frynas 2005: 512).

For the purposes of this review, the entry considers CSR to be an umbrella term to refer to policies and programs that seek to reconcile the pursuit of profit with the well-being of environments and people impacted by business. It focuses on “new” CSR programs and practices that adapt core business practices to mitigate harm and create social and environmental benefits, not “old” CSR activities that are chiefly philanthropic in nature (Auld et al. 2008). Distinguishing these two forms of CSR is crucial for multiple reasons, as one of the authors analyzed in depth elsewhere (Smith 2021). First, new CSR emphasizes and intervenes in the structural conditions that create poverty, environmental injustices, and other harms, while old CSR is grounded in the kind of personal or institutional heroism that does not challenge structures of power. Second, new CSR opens up space for engineers to promote broader societal goals *as engineers* or *as managers* through their professional decision-making, such as where they locate a manufacturing plant or which water remediation techniques they recommend for a contaminated site. Old CSR, in contrast, may involve engineers in opportunities to volunteer or raise money for community organizations, but not chiefly in their capacities as engineers and/or managers.

What both social science critiques of actually existing CSR activities and theories of “new CSR” have in common is that they draw attention to politics and macroethics. Scholarship and practice in this area consider how the harms and benefits of business come to be, are unevenly distributed, and may be potentially reconfigured. For example, how does a planning engineer’s decision to use the block cave mining technique rather than the room-and-pillar method necessarily implicate the number of workers required for a mine, the conditions of their labor, the effects of a population influx on a housing shortage in a rural community, and the visual disturbances of

subsidence for people with place attachments to the mountain where the mine would be located (Smith 2021: 85–88)? Which potential injustices do dominant standards for assessing company performance make legible? What kinds of data are reported under these standards, by whom, and for whom? Making visible the inherent political dimensions of engineering and engineered systems addresses some of the weaknesses of traditional engineering ethics.

## Engineering Ethics and Its Discontents

Engineering ethics as an academic and professionally relevant academic discourse emerged in the 1970s, about the same time as bioethics. As an outgrowth of medical ethics under the influence of advancing medical technologies, bioethics focuses on practices of a profession with significant autonomy. The majority of physicians, like lawyers, are self-employed. The situation with engineers and engineering ethics is different; the majority of engineers are employees of profit-seeking corporations in which they exercise at most tightly constrained managerial responsibilities. As engineer historian Edwin Layton described the situation: “Engineering is a scientific profession, yet the test of the engineer’s work lies not in the laboratory, but in the marketplace” (Layton 1971: 1).

In the United States, organizations such as the American Society of Civil Engineers (ASCE), the American Society of Mechanical Engineers (ASME), and the Institute of Electrical and Electronic Engineers (IEEE) tried to address this dilemma of working as professionals in the context of corporate employment by developing codes of professional conduct. These codes – and there are many, since each society has its own – typically call on engineers to recognize professional obligations to employers (e.g., protect confidentiality), profession (e.g., avoiding conflict of interest), and public (protecting public safety, health, and welfare). Although early on some form of company loyalty had been given pride of place, by the late 1980s, the protection of public safety, health, and welfare was generally

accepted as paramount. Recently some codes have added sustainability as a duty.

In 2000, ABET (incorporated as the Accreditation Board for Engineering and Technology, Inc.) began to require that engineering curricula include some measure of engineering ethics education, which in practice focused on teaching these codes. But real-world enactment remains extremely problematic and subject to business imperatives. First, it’s not at all clear that engineering ethics education has much impact. Second, when seeking to protect public welfare, corporations can reasonably argue that preserving jobs by shaving safety requirements is the greater public good. Safety itself is a shifting good, with some members of the public demanding more, others not so much. Third, who should enforce compliance and how? The absence of a unified engineering voice (there is no overarching organization like the American Medical Association) and the low percentages of professional licensure among engineers (less than one in five working engineers are professionally licensed, whereas all physicians must be licensed to practice medicine) are further complicating factors. Fourth, as one of us has argued, “ethics is not enough” to address the dilemmas faced by engineers as they create and maintain the world in which we all live; what is required is a political theory of engineering to shift focus from personal heroism to the “particular place of engineering in human affairs and the political order” (Mitcham 2016: 71).

One might have thought that business ethics, which emerged as an academic discourse about a decade later than engineering ethics, could help address the dilemmas that engineers often face in the corporate context where most of them work. In passing, it is worth noting that after a surge of interest in the 1980s and 1990s, philosophical interest has been “gradually retreating from the field” (Moriarty 2021). The reality is that business managers, who constitute the large mass of business personnel, are subject to the same marketplace forces as engineers, except even more so. As studies of the managerial revolution in capitalism point out, there is no ethics code for managers other than successfully negotiating diverse pressures. Engineers are regularly enrolled into this

class. As mechanical engineer Roger Boisjoly was told in 1986 when he opposed the *Challenger* launch as unsafe, “Take off your engineer’s hat and put on your management hat.” Insofar as individualistic professional ethics is at the mercy of corporate policies, ethics is subordinate to politics. Given that most ethical issues encountered by engineers are often related to the tensions (and sometimes conflicts) resulting from the diverse roles they navigate on the daily basis, we suggest that engineering ethics education can benefit from taking seriously the practical experiences and moral expectations associated with these roles.

## Role Ethics

Human beings all take on diverse roles in their lives. So do engineers. These different roles do not simply describe the various relationships they have with others but also provide normative guidance on how to live these roles well. The role of engineer does not only *describe* relationships with clients but also *prescribes* particular moral obligations that are indispensable for living these roles well. As engineers work at the intersection of technical work and marketplace, it is very common that engineers often assume roles that more central to their professional training, such as those included in professional codes of ethics (e.g., obligations to properly use certain rules of skill for the engineering profession). Meanwhile engineers also live in some other roles spanning organizational and cultural boundaries within and beyond their corporations such as employee, contractor, and manager (Robison 2016). Many of these boundary spanning roles are related to what James Trevelyan calls “technical coordination” that refers to “the coordination of technical work of other people by gaining their willing cooperation” (Trevelyan 2007: 191).

It is also worth noting that roles (including those assumed by engineers) are often relational. As noted by philosopher Roger T. Ames (2011), responsibility would not exist if there were only one person in the world. Engineers’ roles reside in their relationships with people they serve. Any discussion of engineering responsibility will

become less valuable if we do not specify the particular relationships engineers have with others. These different relationships and roles can serve as sources of moral inspirations for engineers. In other words, appropriate moral judgment can be derived from critically and creatively imagining the moral obligations that are required by these relationships and roles. According to Confucian ethics, critically and reflectively participating in these relationships on a regular basis can lead to the cultivation of various virtues (Cottine 2020). For engineers, it is possible to imagine that their interactions with underserved communities may lead to the cultivation of care whereas interactions with employers may contribute to the development of loyalty. Consider, to get rid of ‘we’ formation one particular role occupied by many engineers: manager.

Although engineers are known for their technical expertise, and engineering education focuses primarily on preparing students to carry out technical functions, there is an implicit career expectation that many engineers will obtain positions as managers of projects and people. In interviews that Jessica Smith and Nicole Smith conducted with around 60 practicing engineers in the mining and oil and gas industries, the majority of the professional titles used by interviewees explicitly signaled managerial responsibilities and included *project manager*, *engineering manager*, *plant manager*, *construction manager*, *development manager*, *asset manager*, *environmental regulatory manager*, *social manager*, and *technical services manager*. A mining engineer who has worked in industry for nearly 20 years described this trajectory:

When I first started working [at the mine]. . . over time, and as I gained experience, you know as an engineer and at the mine site and with the [local] culture, I started to have more and more responsibilities, until I became one of the more senior people on site. I was able to make more informed decisions about things and to technically help the CSR group in things like preparing the communities so they could understand the new project that we were staring to work on. For example, a new pit that we were going to open—we had to prepare models and graphics showing what it was going to look like during the mining and what we were going to do after the mining.

This engineer illustrates how engineers' career trajectories place them in positions where their responsibilities to communities are key to their work. A role ethics perspective shows that in their daily tasks, engineers' multiple roles mean that they must navigate potential tensions between their obligations to corporate mandates, in their position as managers and employees, and to the safety, health, and welfare of the public, as members of the engineering profession (Smith et al. 2021). These tensions make visible the inherent political ethics of engineering or the "particular place of engineering in human affairs and the political order" (Mitcham 2016: 71).

Another mining engineer who had worked his way into executive roles highlighted this by pointing to the power of community disapproval to stop entire mining projects, stating, "If you look at the research, most mining projects now that are stalled are stalled because of social reasons. We're talking mega projects, multi-billion dollar projects. You can throw all the money in the world at them, but they're stalled." He argued that mining engineers and geologists need to appreciate that corporate social responsibility has "gone from being an afterthought, just like health and safety and the environment was years ago, to kind of being, it has to be front-loaded." Imagining himself talking with novice engineers and scientists, he said:

It's not just "getting it." You guys have got to live and breathe this. You've got to be globally aware, not just very good at the maps or the engineering stuff. If you can't do this, you're not going to rise up the ranks in the mining industry or be in a company that's going to be successful. . . Even as a CEO, a lot of shareholders will want to talk about these issues. You've got to meet prime ministers and government officials." (Smith 2021: 47)

These perspectives point to how engineers, especially those climbing the ranks to management, must have the ability to understand stakeholder concerns, from members of the public to government officials and shareholders. To return to the Confucian role ethics framework, this engineer illustrates how regularly participating in relationships can cultivate various virtues. Through his long-term engagement with the communities

surrounding mine operations, he learned to view mining operations through their eyes and ensure good social and environmental performance. Through his engagement with political and business elites, he learned to position mining in relation to wider debates and see how its political, economic, and cultural significance varied by stakeholder group.

Beyond the ability of role ethics to promote fruitful interactions between engineering ethics and CSR is the fact that reliance on engineering ethics codes is largely an American phenomenon. Outside the United States, it is likely that role ethics can serve as a better foundation for promoting engineering responsibility than ethics alone.

## Conclusion

Critical studies of CSR draw attention to the inherent politics of engineering, which can otherwise be obscured in mainstream approaches to engineering ethics that focus on individual behavior. In turn, a role ethics approach to engineering ethics enriches critical studies of CSR by elucidating some sources of the tensions experienced by corporate employees. Engineers inhabit multiple roles – members of a profession, employees of a company, members of a community, etc. – that generate competing accountabilities (Smith 2021).

Through living diverse roles, engineers function as a mediator between the corporate (or organizational) context and the public sphere. Corporate values are enabled and enacted through engineers' everyday practice that serves public interests in communities. Moral imagination and creativity are not cultivated in hypothetical ethics scenarios or philosophical thought experiments but through engineers' diligent efforts to navigate corporate priorities, public interests, and personal commitments. Therefore, CSR connects engineers' professional identity with corporate values and public welfare. A socially responsible corporation is only effective if their employees, including engineers, are capable of practicing CSR values in the community. The relationship of corporate values and engineers' personal values is

critical for both the sustainability of the corporation and engineers' professional development. In summary, a meaningful CSR suggests that engineering ethics should focus on helping engineers develop critical agency in their ethical engagement with the people they serve. Such an engagement allows corporations to further test and refine their CSR values through the everyday practice of engineers in communities.

## Corporate Social Responsibility Assurance

Yuyu Zhang

Queensland University of Technology, Brisbane, QLD, Australia

## Synonyms

Assurance; Corporate social responsibility; Social audit; Sustainability; Sustainability assurance

## Introduction

The International Auditing and Assurance Standards Board (IAASB) defines assurance as the engagement “in which a practitioner aims to obtain sufficient appropriate evidence in order to express a conclusion designed to enhance the degree of confidence of the intended users other than the responsible party about the subject matter information (that is, the outcome of the measurement or evaluation of an underlying subject matter against criteria)” (IAASB 2015, p. 13).

Corporate social responsibility (CSR) assurance in particular refers to assurance engagements where providers express a conclusion to intended users about the information provided in corporate social responsibility reports against chosen criteria. CSR assurance is also referred to as social and environmental assurance, social and environmental auditing, corporate responsibility (CR) assurance, sustainability assurance, and social auditing.

## Theories

A number of theories have been suggested to explain the demand and value of CSR assurance in recent years, including stakeholder theory, legitimacy theory, and signaling theory.

### Stakeholder Theory

Stakeholder theory has provided strong explanatory power in the CSR reporting and assurance literature (Gray et al. 1995). According to this view, a firm's continued existence requires the support of various stakeholders, and an organization's activities must be adjusted to gain the approval of these stakeholders. CSR disclosure and the adoption of voluntary assurance are then not motivated simply by consideration of shareholders' interests but are instead considered to stimulate effective dialogue between the organization and its various stakeholders. Through such disclosure, organizations seek to address the concerns of the stakeholders upon which they depend for their continued existence. Furthermore, Kolk and Perego (2010) document how companies located in countries with stakeholder-oriented legal system and higher pressure toward corporate sustainability due to public policy are more likely to issue sustainability reports and have these reports assured.

### Legitimacy Theory

Legitimacy theory extends stakeholder theory but focuses specifically on the social acceptance required to ensure a company's existence and survival. Deegan (2002, p. 289) defines CSR assurance as "a process that enables an organization to assess its performance in relation to society's requirements and expectations." Accordingly, CSR assurance can be considered a managerial device that directs various social pressures away from an organization, or a strategy undertaken for accountability purposes, verifying the organization's various social impacts. Deegan uses the international sportswear company Nike to demonstrate how CSR assurance, in this case implemented with the assistance of the Global

Alliance for Workers and Communities, can be an effective approach to respond to community suspicion and concerns about labor practices.

### Signaling Theory

Signaling theory claims that one party voluntarily discloses information to another in order to reduce information asymmetry between them (Spence 2002). Managers have incentives to voluntarily disclose both good news (in order to enhance corporate image and financial returns) and bad news (in order to avoid or reduce reputational costs, litigation, and other unfavorable consequences) (Skinner 1994). Applying this to CSR assurance, Moroney et al. (2012) found that disclosure quality scores for assured companies are significantly higher than unassured companies and suggest that companies use CSR assurance to signal their commitment to CSR disclosure. Li and Li (2012) found that firms that engaged an independent third party for CSR assurance experienced higher abnormal returns, suggesting that companies intend to inform the stock market about the high quality of their CSR reporting and that market investors react positively to such a signal. However, support for the theory is mixed, with Li et al. (2013), for example, demonstrating how some Chinese companies that experienced negative social or environmental events chose not to assure their CSR reports in order to avoid the negative signaling effects to the public.

## Standards and Criteria

A number of different standards and guidelines have been developed that inform the practice of CSR assurance.

### Global Reporting Initiative

The Global Reporting Initiative (GRI) implemented the first sustainability reporting guidelines (G1) in 2000, revised to G2 in 2002, G3 in 2006, and G4 in 2013. The most recent GRI Sustainability Reporting Standards (GRI Standards) will supersede G4 for all CSR reports published on

or after 1 July 2018. According to a KPMG (2015) survey of CSR reporting, the use of GRI guidelines is universal but appears to be declining among the largest companies.

The GRI guidelines focus both on how to report and what to report. Part One of the G4 guidelines addresses reporting principles and standard disclosures. Reporting principles refer to the criteria for CSR reporting, whereas standard disclosures are the GRI “questions” to be addressed within the CSR report itself. Part Two of the guidelines provides detailed advice and reporting recommendations.

Regarding assurance, the GRI guidelines recommend but do not actually require the use of external assurance, although companies are expected to state their policy and practice on external assurance as part of their CSR report. Although GRI guidelines are not themselves an assurance standard (as the focus is on CSR reporting), assurance providers often make reference to GRI guidelines when providing CSR assurance for an entity whose report is prepared in accordance with these guidelines.

The GRI guidelines are available at <https://www.globalreporting.org/standards>.

### **AA1000AS and ISAE3000**

Two international standards that have been used in CSR assurance are the *AA1000 Assurance Standard* (AA1000AS) launched by Accountability (2008) and the *International Standard on Assurance Engagements* (ISAE3000) issued by the IAASB (2013). Together with the GRI guidelines, these standards provide an international framework on CSR assurance and are either individually or collectively referenced by assurance providers (Kolk and Perego 2010).

AA1000AS focuses on what is material to the organization and its stakeholders and puts stakeholders at the core of the assurance engagement. The standard identifies materiality, inclusivity, and responsiveness as core principles and provides for two optional types of assurance engagement. The “Type 1” assurance engagement envisages assurance regarding the core principles,

but without any verification of the reliability of the information – no conclusion regarding the reliability of the underlying data is made in the assurance report. The “Type 2” assurance engagement, however, provides assurance regarding both the principles and the performance information; verification of data is essential in a Type 2 assurance engagement, and the assurance provider’s report does include a statement regarding information reliability. For both types of engagement, assurance can be provided at either a “high” or “moderate” level (and a single engagement could provide a high level of assurance for certain matters and moderate assurance for others). The high level of assurance provides greater confidence and relies on wider and more in-depth evidence gathering. Furthermore, AA1000AS requires observations and/or recommendations to be included in any assurance report and suggests that assurance providers go beyond the “pure” assurance engagement and provide professional consultation regarding CSR activities and disclosure (Zhang and Liao 2015).

Although ISAE3000 addresses external assurance for nonfinancial reports, it is not specifically designed for CSR assurance engagements, and by comparison with AA1000AS, ISAE3000 tends to focus on assurance procedures and technical criteria. ISAE3000 does not, for example, provide a specific requirement regarding the level of assurance. This may, however, be appropriate, given the complexity of sustainability reports that combine quantitative and qualitative information, such that any assurance process is difficult to formalize. Accordingly, a CSR assurance engagement based on ISAE3000 tends not to provide a high level assurance on CSR reports (Manetti and Becatti 2009).

Although both AA1000AS and ISAE3000 mention the competence and independence of assurance providers, AA1000AS adopts a more open view regarding who provides assurance services, while emphasizing that “sustainability assurance is a distinct discipline and is best served by a distinct set of competencies (acknowledging that it draws from other disciplines)”

(AccountAbility 2009, p. 11). ISAE3000, however, is focused more on professional accounting firms as assurance providers but nevertheless recognizes that auditors may lack professional competence in conducting CSR assurance and may therefore require experts to address aspects that are particularly complex or subjective (Manetti and Becatti 2009). Engagements adopting ISAE3000 are expected to follow the planning, risk assessment, and assurance evidence collection and evaluation procedures that have been proved effective by the professional accounting profession in auditing and assurance services. AA1000AS, by comparison, does not address risk assessment and assurance procedures and evidence.

AA1000AS is available at <http://www.accountability.org/standards/>. ISAE3000 could be downloaded at <http://www.ifac.org/publications-resources/international-standard-assurance-engagements-isae-3000-revised-assurance-enga>.

## The CSR Assurance Market

The last decade has seen an increase in global consciousness regarding climate change and consequently a significant increase in public awareness of firms' responsibilities regarding environmental and social issues (Simnett et al. 2009). This is reflected by an increasing number of firms actively disclosing CSR information to the public, either in annual reports or as stand-alone CSR reports (KPMG 2013, 2015). With this increase in CSR reporting, demand for CSR assurance services has increased, with more firms voluntarily purchasing CSR assurance to enhance the credibility of their reports (Simnett et al. 2009). According to KPMG (2015), CSR assurance is now firmly established as standard practice among the world's biggest companies, where almost two thirds have their CSR information assured. Obtaining external assurance on the CSR report can demonstrate a commitment to providing stakeholders with high-quality information, and the assurance process can also assist companies in embedding sound CSR reporting

practices and driving internal performance improvements (Cohen and Simnett 2015).

On the supply side, the CSR assurance market is shared by accounting firms and other service providers, including certification bodies and specialist consultancies. Although major accounting firms dominate the market for assurance among Global Fortune 250 and the largest 100 companies across 45 countries, the use of other providers has increased among large companies (KPMG 2015). Following the differences between AA1000AS and ISAE3000 described above, it has been argued that international accounting firms tend to be more conservative and technical in using ISAE3000, whereas other international certification bodies are more likely to adopt AA1000AS in order to provide more flexible certification services (which then allows for more relevant consultation) (Zhang and Liao 2015). This is also suggested by the Federation of European Accountants' discussion paper on *Providing Assurance on Sustainability Reports*, which identifies various certification criteria adopted internationally but employs ISAE3000 as the underlying assurance standard for discussion. However, there are also some examples of assurance providers that use ISAE3000 in addition to AA1000AS and the GRI guidelines.

## Introduction

Business groups (BGs) are a collection of legally independent firms, operating in multiple and often unrelated industries, connected via equity stakes, interlocking directorates, informal ties, and others (Khanna and Yafeh 2007; Ararat et al. 2017; Colpan and Hikino 2010). BGs play a dominating role in many emerging economies. While past literature assumed that business groups could only exist in the absence of well-functioning markets as a functional substitute (Leff 1978), this assumption is challenged by the prevalence of BGs not only in less developed but also in mature economies (see Colpan and Hikino 2018). In spite of the growing attention BGs have received in the last few decades, past work in the management literature has focused on certain aspects of BGs such as the reasons for their existence and persistence, their diversification conduct, and pyramidal structures. Somewhat surprisingly, their strategies and practices that fall under the notion of “corporate social responsibility” (CSR) and their responsibilities for the wider public good have remained an understudied phenomenon.

Group firms can be different from stand-alone firms in a CSR perspective. CSR strategies in business groups may be motivated by group-wide strategies and considerations, for instance, because the effect of reputational benefits (and

This entry draws extensively on Ararat et al. (2018).

risks) can be group-wide. In this entry, we highlight some of the main findings from our literature review of the corporate social responsibility of business groups in emerging economies where business groups remain a dominant organizational form of big business. Our findings can be gathered under four headings: the role of CSR in BGs and BG-affiliated firms; the relation between CSR and the governance of the BG – most notably the influence of ownership; the specific nature of philanthropy as a core expression of CSR in BGs; the corporate (ir-)responsibility related with market power; and the relations with the state and government.

### CSR and the Public Good in a BG Context

First, most research has shown that business groups, especially in emerging economies, provide significant levels of financial, organizational, and technological investment in the wider public good of those economies in which they operate. Given their size and power, business groups seem to be well situated to address social needs and institutional voids. They not only often substitute the missing products and services in areas where they are most needed, but they also offer products and services that effectively substitute and emulate what would be considered welfare state provisions in liberal, developed democracies. BGs are also pivotal to the functioning of markets, the organization of the economy as one of the building blocks of the political economy. These aspects require a much broader and richer understanding of CSR that goes significantly beyond the scope of standard CSR practices. A differentiating role of business groups is that they effectively use CSR activities to justify their dominant presence in the economy and to establish trust and acceptance of their status within society. The work by Shah (2014) that look at the Tata Group in India and Hoque et al. (2014) that analyze the Volvo Group in Sweden for instance come up with similar findings that the extensive CSR strategies of these groups have benefited the overall groups and also the group affiliated firms to gain trust

among their stakeholders, which at the same time helped to limit potential regulatory interventions on these firms.

### CSR and Corporate Governance

Second, the corporate governance issue in business groups from a CSR perspective is related to their governance arrangements and the means of exercising coordination and control. This includes the presence of controlling shareholders often in the form of powerful families and their family-specific goals, and complex control mechanism in business groups that sometimes expropriate minority shareholders (Almeida and Wolfenzon 2006; Djankov et al. 2008). Such expropriation may come via different means. For instance, diversion of profits from affiliated companies to charitable foundations whose income consists of donations by the business group affiliated firms can enhance the reputation and the credibility of the controlling shareholder at the expense of minority investors (Kim et al. 2017; Bae et al. 2012). Choi et al. (2018) show that although overall group affiliation is associated with higher overall CSR, the opportunistic rent-seeking behavior by controlling shareholders decreases the resources available for CSR in group firms. Similarly, Ray and Chaudhuri (2018) show that business group-affiliated firms adopt environmental and social sustainability strategies more often than independent firms. The authors suggest that this is because groups focus more on building and maintaining group-level identity and are less sensitive to short-term financial performance. Furthermore, business groups see themselves as having social roles in filling institutional voids. They also are in a more favorable position (compared to independent firms) in having more resources as they benefit from the diverse group resources. Terlaak et al. (2018) then argue that the positive effects of reputational gains of CSR appear attractive to large business groups as they enhance the public perception of not only the business group but also of its controlling family positively as well.

## Philanthropy in BGs

Third, philanthropy as well as the provision of social goods is a main form of CSR of business groups in emerging economies. Cuervo-Cazurra (2018) conceptualizes the evolution of CSR investments by business groups that are in different stages of economic development. He argues that the level of CSR investments is higher and focused more broadly on the social dimensions of CSR through philanthropic investments in underdeveloped economies. The CSR in such economies tend to focus on infrastructure deficiencies, social needs – and thus in general – philanthropy. However, with the maturing of economies and the strengthening of institutions, CSR investments evolve to a richer environmental and economic responsibility, albeit at a lower level. Griffin and Youm (2018) suggest that business groups that have strong visibility in emerging markets engage in CSR activities to gain social legitimacy. The paper shows that the core focus of CSR for many Korean chaebols is philanthropic or charitable contributions. Oh et al. (2018) then examine the relationship between philanthropy and related party transactions between publicly listed firms within a group. The paper finds out that the level of corporate philanthropy declines substantially when a firm has increased monitoring by outsiders, suggesting that business groups' CSR practices may not be homogeneous and depend on the strength of corporate governance.

## The Dark Side of the Role BGs in Society

Last, but not the least, business groups can play a rather ambiguous role in emerging markets. Given their large size and economic power, business groups often get involved in political rent-seeking (Krueger 1974; Schneider 2010), which means they use their resources to invest in political connections, rather than productive assets. Business groups can also employ CSR in superficial and socially detrimental ways, which we refer as the dark side of CSR. Choi et al. (2013), for instance, find that CSR practices can be used improperly to disguise poor earnings quality and therefore to hide opportunistic management behavior.

Pattnaik et al. (2018) then argue that while business groups provide the necessary goods and services and fill the gaps in their respective economies in emerging markets, at the same time their size and control of markets results in disadvantages for smaller, independent businesses due to the entry barriers that they create for those firms. Su and Tan (2018) then suggest that many large and diversified business groups do effectively bypass some market transaction costs and overcome institutional constraints by establishing offshore companies in tax havens. This however often leads to “the opportunity to evade taxes and disguise unethical or illegal conduct – such as political donations and bribery” (Ararat et al. 2018).

## Conclusion

In this desperately brief entry, we aimed to provide the contemporary scholarly debate on the corporate social responsibility of business groups. In closing we suggest that, first, the examining of BGs as a corporate organization in conducting CSR can contribute to a better understanding of the nature of the firm. A best example to this is the Indian Companies Act that mandated firms to spend 2% of their net profits to CSR. The intention of the Act is to use the resources of largest businesses (BGs being the dominant actors) to deliver social goods rather than simply tax companies that may flow into inefficient and poorly governed public sector. Second, examining BGs provide opportunities to uncover unique perspectives in understanding CSR. As we have argued above BGs conduct CSR mostly through their engagement in philanthropy and charity, but they also employ CSR strategies in socially detrimental ways. Finally, the emerging economy context represents a specific context that strongly affects the nature of CSR and wider prosocial activities of BGs. We conclude that the role of BGs in providing public good and their choice of CSR strategies are shaped in a multidimensional space of organizational structure, ownership typology, and level of economic development, contingent upon the power dynamics between the state and the business groups. Our findings suggest that the nature

of CSR changes with the development of markets, which results in a shift in focus from broader social aspects for public good toward more specific economic and environmental aspects of CSR.

## Corporate Social Responsibility in Japanese Corporations

Kanji Tanimoto

Waseda University, Tokyo, Japan

## Synonyms

Business ethics and Japan

## Introduction

The expanding globalization of markets has revealed – economically, socially, and environmentally – a number of negative aspects across the world. Those corporations that have significant influence on the global economy have been required to demonstrate social responsibility. The CSR discussion originated and developed in European and Anglo-American contexts, based on the principles and structures of the markets, industries, businesses, and societies present in

those regions over the preceding few decades. Despite this, CSR has prevailed globally, also taking root in non-Western countries and regions, meaning that the development of CSR is at different stages across the world (Fukukawa 2009; Higgins and Debroux 2009; Davidson et al. 2018). Japanese companies have also been influenced by this global movement and have translated CSR into the Japanese context (Suzuki et al. 2010; Tanimoto 2016).

There are various discussions about how CSR is recognized and how it functions in the contexts of different countries. Since the 2000s, there have been a growing number of studies, from Asia and other non-Western regions, offering alternative perspectives on CSR. What is important in these studies is the institutional explanation of how CSR has been transposed and is working in various countries, rather than simply a focus on cultural differences in CSR.

## CSR Definition

It is useful to try and reconfirm a definition of CSR here. The diverse nature of CSR makes a clear and specific definition challenging, while the scope and meaning of CSR is dependent on the country and the time period. Nevertheless, the common essence of CSR can be said to be the nature of management itself, as well as the organizational processes of that management.

CSR, in its narrowest sense, can be defined as the incorporation of social fairness, ethics and considerations for the environment, human rights, and other aspects into the processes of corporate activity, while simultaneously attempting to take into account all relevant stakeholders, including shareholders, employees, consumers/customers, the environment, and the community. In a broader sense, it also includes philanthropic activities and social businesses addressing social issues with innovative ideas.

For a long time, most business people in Japan understood CSR as being related to employment security, compliance, or philanthropy. Recently, however, they have increasingly come to recognize CSR as a core business activity, one that should be incorporated into management

processes. This recognition mostly postdates the so-called second CSR-boom, which will be outlined later.

So, how have Japanese corporations responded to the global CSR movements and how have they transposed to them? The institutionalization of CSR has progressed rapidly since the mid-2000s and today Japan has one of the world's highest ratios of companies which publish CSR reports. But how do Japanese corporations strategically embed CSR into their organization?

## Background

There were two CSR booms in Japan. The first CSR boom was in the 1970s, driven by the movement in the USA at the time. Following the rapid economic growth Japan experienced after World War II, its working people have faced fundamental questions of introspection: What is affluence? What is the purpose of a corporation? Japan imported the concept of CSR from the business and academic sectors in USA. At the time, many CSR-related books were translated into Japanese. The discussion, however, was focused entirely on the philosophical arguments for CSR, rather than its practical implementation. In practice, CSR was not incorporated into business practice at all. After the oil crisis, however, the entire discussion disappeared in around 1980.

The second CSR boom was in the middle of the 2000s, prompted by global movements. The internal and external factors that pushed Japanese corporations to engage in that second CSR boom were as follows (Davidson et al. 2018).

1. External: criticism from the global market. Japanese corporations were subject to severe criticism regarding their neglect of human rights and environmental management in their overseas supply chains.
2. External: global movements in CSR and sustainable development. Alongside the initiation of global CSR discussions, many CSR standards and codes of conduct emerged internationally and took on leverage against Japanese corporations.

3. Internal: structural market changes. Since the collapse of the bubble economy in the early 1990s, mutual shareholding between corporations in the same business group changed drastically. At the same time, foreign shareholding (by institutional investors) grew rapidly and became more influential in the Japanese market.
4. Internal: peer pressure. Japanese corporations are, by nature, always concerned about what other companies are doing. Most of them passively adopted CSR, prompted by leading companies being the first to introduce it.

So while Japanese corporations hesitated, at first, to respond to CSR, in time they did come to recognize it a material management issue, leveraged by these factors.

In the early stages, there were differences across industries in how they adopted CSR. Tanimoto and Suzuki (2005) have shown that the institutionalization of CSR was positively associated with foreign ownership share, overseas sales share, and environment-related sectors. There was a remarkable difference in CSR adoption between global companies working in industries, such as manufacturing, and domestic companies, working in industries such as construction.

### Rapid CSR Institutionalization in Japanese Corporations

Traditionally, Japanese companies have a habit of following the style set by leading companies: Do as the leading companies do, keep up with leading competitors. A very typical institutional isomorphism occurs in relation to CSR in Japan. Institutional factors such as government authority, the maturity of civil society organizations, investor actions, and consumer behavior are different from those seen in other countries. Economic, social, and political determinants impact the forms in which corporations take on CSR, as well as how the concept of CSR is introduced into organizations (Brammer et al. 2012).

Here we can review the organizational fields in Japan which created the process of mimetic

isomorphism with relevant stakeholders in the early period of the second CSR boom in the 2000s.

- Industry: the Keidanren (Japanese Business Federation) understood that CSR is a voluntary initiative and avoided any mandatory approach to CSR (Tanimoto 2012b). They insisted that CSR should not be regulated by the government nor set in law. (Incidentally, the Keidanren still do not take a positive stance on CSR matters, instead simply following the latest international trends.)
- National government: The Government of Japan did not consider CSR to be a material policy issue and did not react positively in the face of the negative attitudes displayed by business associations. (Today, their policy remains fundamentally unchanged.)
- Labor unions: the primary focus of labor unions remained on negotiating better employment conditions with employers, and thus, they paid little attention to managerial concerns such as corporate governance and CSR. (Today, they take a proactive stance after engaging with the ISO 26000 meetings.)
- Civil society organizations (CSOs): CSOs monitor and survey the activities of business and government and carry out advocacy campaigns. However, the CSO movement in Japan was immature, meaning that Japanese corporations faced no strong domestic pressure from CSOs and felt no need to engage with them. (Today, the CSO movement has been growing gradually over the past decade.)
- Media: The CSR boom represented a big business opportunity for newspapers, publishers, and consulting companies, in such areas as publishing introductory books, creating CSR rankings, and awarding prizes in CSR. (Today, they are similarly busy with the SDGs boom.)
- Academia: Initially there were very few academic researchers in this field in Japan, which is indicative of the low interest of the business sector in CSR. (Even now the number of researchers remains low.)

Many Japanese companies carry out an isomorphic application of CSR. However, said CSR

management system does not automatically work in the company's organization by just relying on perfunctory compliance with CSR guidelines. Some companies keep their CSR activities to the minimum levels required, while others incorporate CSR strategically into their organizations in order to gain a reputation for responsibility in the market. There is a significant difference between the mimetic adoption of CSR and the implementation of strategic CSR management (Tanimoto 2016).

### The Toshiba Case

A typical case of the negative impact of the mimetic isomorphism of CSR management system can be found in the Toshiba Corporation, formerly a leading electronics company. Toshiba was found to have engineered a \$1.2 billion accounting scandal, about which they had been systematically lying since around 2008. The fraud was brought to light by whistleblowing in 2015. Ironically, in 2007, Toshiba had been ranked top in Japan in both CSR and corporate governance ratings. In reality, neither of those oversight systems had actually functioned within its organization. The result was the total loss of any credibility on the market and near collapse as a company.

It was pointed out by the third-party committee for the Toshiba accounting fraud that there were problems with Toshiba's corporate culture: the absolute power of the boss (unchecked power), the profit-first approach (short-termism), and the sectionalism (inward-looking). These same organizational factors were what had prevented the incorporation of CSR into Toshiba's organization. What this demonstrates is that there has long been a gap between "presumed CSR performance" and "actual performance" in management systems. While CSR management systems may have been established, that did not mean that CSR had automatically been embedded into management processes and strategies.

### Is Japan Stakeholder-capitalism?

The Japanese corporate system has been characterized as a "stakeholder model," rather than a

"shareholder model." Traditionally, it has been structured by relational trading between companies, a main bank, subcontracting companies, and long-term relationships between the company and its employees. Some European sociologists understand the Japanese corporate system to work on the basis of a "stakeholder-oriented model." However, close attention should be paid so such a uni-dimensional view. Since the end of World War II, Japanese corporations have tended to forge close relationships with "core stakeholders," namely, major corporate shareholders (with almost no foreigners), permanent employees (mostly male, Japanese, without disabilities), primary subcontractors (first tier), and the national government. A corporation has formed a closed network, together with its core stakeholders, in the market, in which they share values and a common goal for economic development. In this way, corporations have built stable, lasting, and closed relationships with core stakeholders.

On the other hand, "peripheral stakeholders," namely, minor individual shareholders, non-regular workers (female, foreign, with disabilities), and second or lower tier subcontractors, have been excluded from the system. Can this really be described as a "stakeholder-oriented model"? Certainly, it is not a model based on any notion of CSR.

This system has been one of the great strengths of the Japanese economy since the end of World War II. Despite this, it is now anachronistic and is causing problems of social irresponsibility. In particular, Japanese corporations have demonstrated a lack of consideration for gender equality, human rights, and the Fairtrade movement. Today, the system has become something of a weakness for Japanese corporations, as the business environment undergoes rapid change in the age of sustainability.

### "Sanpo-yoshi" as Japan's Original CSR?

While CSR may have developed internationally, each country has its own original ideas and discussions about CSR. Some business people in Japan have pointed to "sanpo-yoshi" as Japan's very

own, original idea of CSR. “Sanpo-yoshi” is an old Japanese merchant’s principle, dating from the seventeenth to the nineteenth century; it translates as “good for three parties,” in other words the seller, the buyer, and society. “Sanpo,” broken down, refers to the *urite* (seller), the *kaite* (buyer), and *seken* (=society), while *yoshi* means “good” (Tanimoto 2012a). It should be noted that the term *seken* does not necessarily have entirely the same meaning as “society” in English. *Seken* in Japanese indicates a relatively closed community, rather than an open society. Moreover, the “sanpo-yoshi” principle focuses on three parties only, while the current concept of stakeholders is more broad-ranging.

In practice, however, subsequent to the modernization of Japan, the “sanpo-yoshi” principle was not generally adopted by the business community as a managerial philosophy, and “sanpo-yoshi” holds little theoretical relevance to CSR.

Relationships between business and society differ greatly according to country and region. It can be argued that the non-Western world has quite different views on CSR to those held by the Western world. Japanese companies have their own unique relationship with stakeholders, ones which have changed over time. At the same time, however, common criteria for and standards on CSR have been set for multinational corporations operating in global markets. As such, Japanese corporations are required to reconsider and rebuild the relationships they hold with stakeholders.

## Challenges for Japanese Corporations

Since the mid-2000s, the Japanese business community has paid increasing attention to CSR and many companies have been proactive in introducing CSR-related systems. Since the sustainable development goals (SDGs) boom, starting in 2015, quite a few companies have renamed their CSR departments as their “sustainability management department.” They are also striving to respond to strong pressures from ESG investment by foreign institutional investors. However, the concept of sustainability does not easily take root in every company’s management system.

For most companies, it is easier to promote what they do in terms of SDGs than to build up a truly responsible management system that could be third-party certified positively evaluated by rating bodies. Nevertheless, Japanese corporations are now ostensibly required to build resilient and sustainable management frameworks to secure responsible competitiveness and create value in the market in the age of VUCA (volatility, uncertainty, complexity, and ambiguity) scenarios, especially those arising from the COVID-19 pandemic of 2020 onwards. Still, Japanese corporations continue to lag when it comes to sustainability. Indeed, over the last couple of decades, Japan has been slipping down in the rankings as a leader of innovation. According to the IMD World Competitiveness Ranking 2020, Japan ranks 34th globally, having dropped below other developed countries.

There are several challenges ahead for Japanese corporations.

1. First and foremost, business leaders must redefine the purpose of business, articulate how companies can integrate sustainability into their management processes and daily undertaking, and also create economic and social value through social/sustainable innovation for all stakeholders, rather than just for shareholders. Rather than simply advocating an emphasis on CSR or SDGs, these companies need to actually integrate social and environmental concerns into their business strategies.
2. Companies need to engage constructively with relevant stakeholders both at home and abroad. Rather than a “talk and listen” style, companies should seek to engage in dialogues that can generate innovative ideas through collaboration with stakeholders.
3. Companies need to participate positively in international CSR and nonfinancial disclosure initiatives, in order to work with stakeholders to develop and implement standards and codes of conduct. They need to take a leading role in the international discussion on sustainability issues, rather than simply raising their antennae in order to be alerted of and be able to follow new trends.

4. Universities and companies need to foster a new generation of sustainability leaders equipped with sustainability mindsets. These new leaders will be expected to embody the following four qualities: visionary, empowering, collaborative, and innovative. Business schools need to work on integrating CSR and sustainability into their courses and the curriculum in order to catch up on this new trend of sustainability education (Tanimoto 2022).
5. Japan's national government needs to develop policies for promoting green and circular economies through the effective leveraging of advanced environmental technologies, in particular those developed by the materials and the manufacturing industries.

## Corporate Social Responsibility Reporting Frameworks

Warwick Stent  
School of Accountancy, Massey University,  
Auckland, New Zealand

## Synonyms

Environmental, social, and governance reporting;  
Sustainability reporting; Triple bottom line reporting

## Introduction

Recent decades have seen considerable attention paid to how corporations discharge their social responsibilities, as well as to the way in which this is reported. Various approaches have evolved over the years, and in 2015, Tschopp and Huefner (p. 566) noted that “There are hundreds of

domestic CSR reporting guidelines, principles, regulations, and standards, and several other global initiatives, such as Organization for Economic Cooperation and Development (OECD) Guidelines, International Labour Organization (ILO) Conventions, and International Organization for Standardization (ISO) Standards.” They further identified, based on prior literature and CorporateRegister.com (ostensibly the world’s largest online directory of CSR reports), that the most widely recognized CSR reporting frameworks were the Global Reporting Initiative (GRI), AccountAbility’s AA1000 Series, and the United Nations (UN) Global Compact’s Communication on Progress (COP).

More recently, however, Rupley et al. (2017) single out the creation of the Sustainability Accounting Standards Board (SASB) and the emergence of integrated reporting (IR) as the latest changes in the continual evolution in sustainability reporting. Interestingly CorporateRegister.com had been updated as of January 2018 to reflect only two frameworks, those of the GRI and the International Integrated Reporting Committee (IIRC).

Stent and Dowler (2015) document how the establishment of the IIRC in 2010 had its roots in initiatives sponsored by the Prince of Wales, which were intended to improve sustainability reporting. The IIRC has subsequently developed as a global coalition of leading entities who believe that IR is the next step in the evolution in corporate reporting. Of the various approaches to reporting on corporate social responsibility, integrated reporting is now arguably the most comprehensive, influential, and recent of initiatives to provide a coherent reporting framework. The IR Framework itself was released in December 2013 by the IIRC, as a principle-based, overarching framework that seeks to complement rather than to replace existing corporate reporting frameworks. This is clear from the requirement that an IR’s content elements should include a summary of any significant frameworks, which are used to inform how material matters are measured and reported (IIRC 2013, 4.47). The remainder of this entry describes the IR Framework itself, as a useful overall framework for CSR reporting, as

well as several organizations listed on the IIRC website as IIRC partners, which provide some additional and more specific CSR reporting frameworks.

## The IR Framework

It is important to note that IR is defined as “A process founded on integrated thinking. . .” (IIRC 2013, p. 33). The IIRC, in describing its long-term vision and aims, places considerable emphasis in the opening page of the IR Framework, on the importance of concepts such as “integrated thinking,” “integrated reporting,” and “connectivity of information.” This can be strongly contrasted with the more traditional “. . . numerous, disconnected, and static communications” of the past and is perhaps the major point of difference between past sustainability reporting initiatives/frameworks and IR (IIRC 2013, p. 2).

The table below provides a brief overview of the IR Framework’s main requirements. In essence, they are concerned with communicating certain fundamental concepts to users in accordance with a number of guiding principles. The “content elements” seek to ensure that important questions about the fundamental concepts are addressed in the report to assist users in assessing the entity’s ability to create value.

| Fundamental concepts                                                                                                                                                                                                                                                                                                                                                             | Guiding principles                                                                                                                                                                                   | Content elements                                                                                                                                                                                                           |

Adapted from Stent and Dowler (2015)

This table also assists in providing further context for the additional and more specific frameworks identified below. Traditionally, corporate reporting has emphasized consideration of *financial* capital, where, for example, the *International Financial Reporting Standards (IFRS)* are commonly used as the significant framework to inform how material matters are measured and reported. The IFRS Foundation is listed on the IIRC website as an IIRC partner (IIRC 2017) and is the body which oversees the setting of IFRS through its International Accounting Standards Board (IASB). CSR, however, is traditionally concerned more with other capitals, such as *natural* capital which has to do with the environment and resources like air, water, and land.

### Global Reporting Initiative (GRI)

The IIRC's description of the GRI as an IIRC partner (IIRC 2017) emphasizes the importance of the G4 Sustainability Reporting Guidelines as a starting point for ensuring robust sustainability metrics. The GRI claims that it provides the world's most widely used standards on sustainability reporting, dealing with climate change, human rights, and other areas. The latest GRI Standards were launched in October 2016 but are based on the G4 Guidelines, a fourth-generation set of guidelines released in 2013 and evolved since the inception of the GRI in 1997. There are 36 standards arranged in sections 100 to 400 (GRI 2017):

- The first three standards, GRI 101–103, are described as universal standards.
- The next six, GRI 201–206, are categorized as economic standards and include standards on anti-corruption and anti-competitive behavior.
- The following eight standards, GRI 301–308, are categorized as environmental standards and include standards on materials, energy, water, biodiversity, emissions, effluents, and waste.
- The remaining standards, GRI 401–419, are categorized as social standards and range

from employment to child labor to human rights.

Application of the GRI Standards requires compliance with ten “reporting principles,” four of which are concerned with report content and six which are concerned with report quality. There are two options allowed for preparation of reports in accordance with the GRI Standards:

- Core – a report with the minimum information required to understand the organization, its material matters and impacts, and how these are managed
- Comprehensive – more extensive reporting

### Carbon Disclosure Project (CDP)

The CDP runs a global disclosure system that enables corporations and other entities to measure and manage their environmental impacts, in particular greenhouse gas emissions (CDP 2017). The organization is listed on the IIRC website as an IIRC partner (IIRC 2017) with emphasis on the role that both organizations have to play in driving corporate reporting disclosures, which can assist toward preventing dangerous climate change and protecting natural capital.

### Sustainability Accounting Standards Board (SASB)

The SASB describes itself as an independent standards setter for 79 industries. The standards are described as being designed to help companies satisfy regulatory obligations under US securities laws. Incorporated in 2011, the SASB developed these standards in response to research conducted at Harvard University on the materiality of sustainability information and associated industry-level performance indicators. The standards are described as provisional, pending a review and intended finalization during the first quarter of 2018. They are categorized in terms of 11 major

sectors within the Sustainability Industry Classification System (SASB 2017).

## World Business Council for Sustainable Development (WBCSD)

The WBCSD is an organization comprised of over 200 leading businesses, representing a combined revenue in excess of US\$8.5 trillion and 19 million employees, as well as a global network of almost 70 national business councils (WBCSD 2017). The organization aims to assist members with sustainability projects, including access to tools and expertise. Perhaps most relevant in terms of CSR reporting frameworks is what is referred to as a system for “redefining value.” Under the latter heading, the organization indicates that it is developing frameworks and resources to “...advance nonfinancial capital measurement, valuation, and reporting.” The WBCSD also provides access to various resources, for example, a “tool” described as “The GHG Protocol: A corporate reporting and accounting standard (revised edition)” (WBCSD 2017).

## Conclusion

Tschopp and Nastanski’s (2014) research on the harmonization and convergence of CSR reporting standards concluded that the GRI appears to offer the most likely way forward. They note, however, that this is likely to be a long and arduous process and that the services provided by other organizations would still be needed. The IIRC’s approach and steps taken to date appear to provide promising indications of an evolutionary path toward such harmonization and convergence.

## Corporate Social Responsibility: A Bibliometric Research

Pedro Antonio Martín Cervantes, María del Carmen Valls Martínez and Salvador Cruz Rambaud  
Department of Economics and Business,  
University of Almería, Almería, Spain

## Synonyms

Bibliometrics; Contextualization; Corporate Social Responsibility; Globalization

## Introduction

Providing a global and objective image of the main lines of research, which has addressed the study of Corporate Social Responsibility, from its

origins to the present, represents an ambitious challenge quite difficult to carry out if the applied methodological approach is not appropriately implemented. In this sense, it has been followed an approach parallel to that outlined by the seminal project headed by Diderot and d'Alembert during the eighteenth century when elaborating the first of all encyclopedias (Diderot and d'Alembert 1751). With an undeniable pedagogical and internationalist vocation, this magnificent work was characterized by reducing to its minimum expression all the phenomena included in each entry.

A bibliometric analysis has been the tool implemented chosen to synthesize the last 50 years of research focused on the field of Corporate Social Responsibility to give a generic answer to the main questions: what? who? how? when?, and where? which define this research. From this analysis, it can be concluded that this term is a polymorphic concept, entirely dependent on the evolution of everything that society, at any given moment, considers as "Social Responsibility." Nowadays, the scenario initially described by Bowen (1953) in "Social Responsibilities of the Businessman" has given way to thousands of publications (verbatim) in which social aspects are increasingly diverse, as are the different topics, countries, and contexts with which it has been gradually related in the most recent lines of research. In fact, the study of Corporate Social Responsibility and Business Ethics is linked to the axiological evolution of societies, so that certain issues, which in other times and circumstances were not linked to Corporate Social Responsibility, are now in full force.

Among many others, it is important to mention the reconsideration of leadership in the business world (Michalos 1981; Poff 2010), the inclusion of the Green Economy (Poff 1994), or the gender dimension of Corporate Social Responsibility (Valls Martínez et al. 2020). There is no doubt that the geopolitical changes, which have taken place over the last few decades, with the emergence of new interlocutors on the world economic scene such as the BRIC countries and, above all, the impact of globalization, have meant that Corporate Social Responsibility has opened up to

increasingly heterogeneous lines of research. Similarly, globalization has led to the expansion of scientific knowledge all disciplines so that, according to Waltman, Tijssen & van Eck (2011), the average collaboration distance per publication has increased fivefold, from 334 km in 1980 to 1,553 km in 2009, describing a cumulative growth rate of over 5% per year. Obviously, this fact has been noted in this area of knowledge, by generating a close contact between researchers from different areas, countries, and cultures.

In summary, the analysis derived from the application of bibliometric techniques allows the analysis of the intertemporal evolution of Corporate Social Responsibility according to the different linked areas, making it possible for the researcher to obtain a joint comparison of the different predominant points of view in this research. Such a contextualization is far from a simple "literature review" since it is able to bring together any aspect related to this research over a period of time: from the type of work or collaboration between authors, as well as their productivity, indicating, among other aspects, that will be considered next, which countries or publications are at the forefront of Corporate Social Responsibility research.

### **Fifty Years of Research on Corporate Social Responsibility: A Bibliometric Summary**

For the elaboration of this research, a detailed bibliometric analysis of all works indexed in the SCOPUS database during the period 1970–2020 has been carried out. The term "Corporate Social Responsibility" has been expressly mentioned in the title. The following approach is congruent with the bibliometric analysis previously carried out in other areas of knowledge (see, i.e., Cuccurullo et al. 2013, 2016, 2017).

The year 1970 has been chosen as the starting date of the analyzed period. The choice of this year is not arbitrary because of its significance on the conceptualization of the current Corporate Social Responsibility. It must be underlined the transcendental contributions of M. Friedman

(1970) which would derive in the first explanatory theory of Corporate Social Responsibility, viz., the stakeholder theory, taking into account that, according to the existing literature, this event would suppose the popularization of the term and the awareness of its relevance to the scientific community.

Table 1 represents the “core” of this research. In total, 9,576 papers have been collected, among which articles and book chapters predominate (7,893 papers). The depth of this analysis is evident due to the large number of references contained in the selected works (more than 330,000). Likewise, the majority of these works are signed by more than a single author (more than 85%), by specifying the nine authors whose literary productivity has been greater throughout the period considered (measured by the number of works produced). The boom of researches focused on Corporate Social Responsibility can be summarized by observing that the number of publications increases according to an average

cumulative growth rate of 3.27%, that is, this number is doubling each 21.53 years.

Table 2 exhibits those journals with the greatest number of published works, which have been aimed at analyzing Corporate Social Responsibility as well as the most common keywords. Concerning the former, it is worth highlighting the essential role played by the “Journal of Business Ethics” in disseminating the knowledge related to this research. The first six publications include a large number of manuscripts: Journal of Business Ethics, Corporate Social Responsibility and Environmental Management, Social Responsibility Journal, Sustainability, Journal of Cleaner Production and Journal of Business Research. The large number of keywords indicates that this research has been progressively diversified: Obviously, the most repeated concept is Corporate Social Responsibility per se, associated with multiple topics (e.g., Ethics, Governance, Legitimacy, Mining or Communication), theories (e.g., Stakeholder Theory or Institutional Theory), and

**Corporate Social Responsibility: A Bibliometric Research, Table 1** Stylized facts of the research

areas or countries (e.g., China, Malaysia, Nigeria, or India).

On the other hand, Fig. 1 shows the number of citations per author, measured in average values (a), forming a series of maximum “peaks” during the years 1974, 1980, 1990, 2000, and 2019. Next, it can also be observed that the beginning of the third millennium supposed an exponential growth of the annual scientific production (b). Finally, subfigure (c) outlines the scientific production related to Corporate Social Responsibility, concentrated according to the countries of origin of

the main author, by distinguishing whether each manuscript has been produced in the same country or, on the contrary, has been the result of a collaborative network of authors from different nations.

## Conclusions

The evolution of society’s mentality, as well as the geopolitical changes, which have taken place over the last 25 years, have led to a diversification of Corporate Social Responsibility from multiple

**Corporate Social Responsibility: A Bibliometric Research, Fig. 1** Main figures of the research. (a) Average articles citations per year. (b) Annual scientific production. (c) Most productive countries

Corporate Social Responsibility: A Bibliometric Research, Fig. 1 (continued)

points of view since the “social” component of the term has incorporated some previously unthinkable elements, essentially sustainability, the desired parity between men and women, respect for diversity and minorities, and environmental awareness. It is essential to highlight that Corporate Social Responsibility has not changed, but rather the mentality of an already fully globalized society and, consequently, its public opinion.

Therefore, faced the task of quantifying and describing in detail the different lines of research, which have covered the study of this discipline, bibliometrics is a particularly suitable tool to offer a “helicopter view” of the entire literature. Bibliometrics is, by no means, intended to be a mere instrument of designing a literature review: Its scope allows the researcher in this area to have a practically unlimited source of information, which facilitates the contextualization of any study. Moreover, Bibliometrics also serves as a frame of reference or an element of inspiration, objectives from which this entry in the Encyclopedia has been expressly elaborated.

## Corporate Sustainability and Climate Change

Karin Buhmann

Department of Management, Society and Communication and the Department of Law, Copenhagen Business School and the University of Southern Denmark, Frederiksberg, Denmark

### Synonyms

Climate governance; Corporate social responsibility (CSR); Global warming; Just transitions; Systems interconnectedness

### Introduction

Climate change can impact companies' operations and access to resources ranging from energy to raw materials and labor. It can affect their ability to deliver goods and services according to contracts or where there is a market. The systems-orientation to sustainability leads to new

expectations on companies to do their part for the holistic sustainability of environment, societies, and the economy. Governmental commitments and social expectations lead to new requirements on energy use and sources as well as new economic opportunities through innovation and investment. Moreover, the ideal of an equitable, fair, and just transition challenges companies to ensure they reduce potential harmful societal impacts resulting from involvement in climate change mitigation and adaptation.

Scientifically, climate change is a huge and complex topic of global consequence that cuts across many disciplines. While natural scientist have played a major role in researching, exploring, and documenting the process and its causes, social and other scientists also have a role in explaining impacts on societies, the economy and human livelihoods, and proposing measures for organizations and individuals to help mitigate the process as well as its societal impacts (IPCC 2018; Rockström et al. 2009). From a business and professional ethics oriented social science perspective, a transition to a low-carbon or “green” economy plays an important role in this regard. The current entry adopts a social science approach to the issue of corporate sustainability and climate change.

From a perspective of business and professional ethics, there is a close connection between corporate sustainability and climate change as well as climate change mitigation. This connection means that companies and their managers must act with consideration of the consequences that their actions have for climate change and the success of the transition to which governments have committed. However, this is not just about reducing CO<sub>2</sub> emissions. Because of the interdependence of systems, companies also need to consider the implications of their contributions to cutting carbon-based energy or their support for research and innovation in this regard. Companies should also pay attention to the social implications of the steps that they take for those purposes in line with the idea of a just transition that does not disproportionately push the burdens of the transition on to certain groups or individuals. Aspects of moral responsibility can be useful

for managers to navigate this complex interconnection. From a business ethics perspective, a strict corporate sustainability approach to avoid contributing to global warming or other aspects of climate change that will disrupt the interconnected systems can be complemented by a more conventional corporate social responsibility (CSR) approach in which the company takes action informed by moral views of doing good and not causing harm.

The main text of the entry first explains the concept of corporate sustainability and how it differs from CSR. Next it provides a very brief overview of climate change causes and effects and of global climate change governance. It proceeds to challenges and opportunities for businesses from a corporate sustainability perspective, with a particular focus on climate change mitigation and adaptation related to temperature reduction and related governmental policy. Finally, it discusses expectations and challenges for companies in regards to the ideal of equitable, fair, and just transitions and explains how companies may benefit from guidance from the management approach of a human rights risk-based due diligence in order to ensure that actions driven by corporate sustainability are balanced in regard to impacts on local host communities of low-carbon energy and transition minerals mining. The concluding section sums up.

### Corporate Sustainability

The term “corporate sustainability” is often used synonymously with “corporate social responsibility” (CSR). However, the two terms have different origins, and at their core address corporate impacts on society from two different scientific perspectives. The notion of corporate sustainability has evolved with a point of departure in natural science and systems perspectives on business in society (Bansal and Song 2017). Taking its cue from natural science studies on sustainability and sustainable development, “corporate sustainability” at a fundamental level seeks to understand connections and interdependencies of economics, society and the environment. As a result of the interconnection and interdependence of systems that make up the world, impacts on one part of the

overall system also have effects on the others: if the environment suffers due to global warming, society and the economy will suffer as well. The systems perspective to (corporate) sustainability entails that the economy and/or economy-driven actions of corporate managers are not seen in isolation but rather as related to an overall ecology that also includes, at least, the environment and society at large.

Natural science studies in the 1980s highlighted limits that a healthy global environment poses to societal and economic growth. In the report “Our Common Future,” the expert World Commission on Environment and Development (“Brundtland Commission”) set up by the United Nations (UN) defined sustainable development as development that meets the needs of the present without compromising the ability of future generations to meet their own needs (UN 1987). It argued that economic activities must be constrained within the limits of natural resources. Due to the interdependence of systems, an overuse of natural resources would hurt the economic system as well as general societal resources. More recently, the systems’ perspective and its implications for the economy and wider society have drawn renewed attention with the publication of research on “planetary boundaries” (Rockström et al. 2009).

At its root, CSR differs by taking its cue from moral theory and ideas on business ethics and considering the morality of managers and their moral responsibility to society and the environment (Bansal and Song 2017). This concept goes back to debates in the 1950s (if not before) on the moral responsibilities of managers and implications for how socially responsible managers and firms can make profits.

During the 1990s and 2000, a confluence occurred of the notions of corporate sustainability and CSR, leading to overlaps and imprecision which is not conducive to scientific studies. For the purpose of stringency, Bansal and Song (2017) argue that academic debate on corporate sustainability should retain a systems perspective to the firm and society, whereas CSR studies should focus on the morality perspective to provide a normative theory of the firm. One does not

exclude the other. As demonstrated in here, CSR perspectives complement corporate sustainability, for example, in regards to solutions to global warming as an aspect of climate change.

### Climate Change: A Very Brief Overview

Climate change increases the occurrence and threat of floods, natural fires, drought, pest invasions, salination affecting soil or fresh water sources, changes to weather phenomena like storms and hurricanes making them stronger and more vicious, just to mention some of the effects on the environment.

Global warming is a key aspect in the climate change that the world is currently witnessing with long-term rise in temperatures globally. While some changes in temperature occur naturally over long spans of time, the significant rise in temperatures that the world has experienced in recent decades is caused by increased concentrations of greenhouse gases in the atmosphere due to human activity (IPCC 2018; Rockström et al. 2009). Causes include the burning of fossil fuels (oil, gas, coal), deforestation and clearing of trees and bushes for farming or industry, agriculture (including livestock like sheep and cattle that produce methane, a powerful greenhouse gas), farming of soil which can release stored greenhouse gases, and use of fertilizers that release greenhouse gases.

Accordingly, global warming causes ecosystems to be stressed. Following the systems logic, this affects the social and economic systems as well. As a result of the environmental stress, living conditions for humans and other living beings are stressed as well. Housing, grain, and livestock may be lost to floods, fire, storms, or pests; diseases and maternal and infant death may increase with lack of access to clean water; and resources need to be devoted to survival rather than social and economic development, including business activities and development. Climate change may lead to displacement and migration that cause human suffering and can disrupt access to labor. In order to limit these effects, scientists in the Intergovernmental Panel on Climate Change have recommended rapid and far-reaching

transitions in land, energy, industry, buildings, transport, and cities (IPCC 2018).

Climate change affects cold polar areas in the Arctic and Antarctica even more strongly than nonpolar areas. In a vicious circle, once global warming reaches certain levels, areas under permafrost begin thawing, thereby releasing methane and other greenhouse gases that have been stored in the frozen ground; and ice thaws, thereby giving way to land or sea that is darker and attracts and stores heat from the sun rather than, as ice, reflecting it away.

For companies committed to social responsibility, it is worth noting that in addition to the environmental and economic implications, climate change impacts the enjoyment of several human rights, including water, food, health, and housing.

### Global Climate Change Governance: The Paris Agreement and Agenda 2030

Adopted in 2015 under a process organized by the UN since the 1990s, the *Paris Agreement on Climate Change* demonstrated commitment by most of the world's governments to address the challenge of climate change. Parties to the Paris Agreement commit to strengthening the global response to climate change by limiting global warming and strengthen countries' efforts to deal with the impacts of climate change. Adopted in the same year under another UN process, the text of *Agenda 2030* set out the 17 Sustainable Development Goals (SDGs). SDG 13 is a commitment to urgent action to combat climate change and its impacts, and SDG 17 a commitment to strengthen the means of implementation, including by global partnership for sustainable development. Like the Paris Agreement, Agenda 2030 is adopted by governments but both texts recognize a role for the private sector in addressing the challenge of climate change and related societal impacts. This role includes conducting business in a manner that does not further climate change, for example, by cutting down greenhouse gas emissions; contributing to innovation, research, and investments towards a low-carbon economy; and paying attention to the ideals of climate justice and an equitable, just, and fair transition, for example, by

identifying and managing the risks of harmful social or environmental impacts that can be unintended effects of climate change mitigation efforts.

### **Climate Change: Challenges and Opportunities for Business**

Climate change presents challenges to companies and entire sectors in several significant ways. On the practice side, climate change may affect the way that companies do business by making processes more difficult, or restricting access to raw materials. Climate change may cause floods that ruin transport roads, fields, or production facilities in low-lying areas. On the political and regulatory side, governmental commitments to reduce greenhouse gases can affect costs and access to energy and lead to requirements on companies to adapt or reduce energy use and change energy sources. On the market side, governmental commitments to the Paris Agreement mean that companies in fossil fuel sectors, such as coal, oil, and gas, can expect considerable reduction in demand in response to changed energy forms.

Climate change also presents opportunities to business. Global warming thaws ice in sea corridors in the Arctic, making sea transport available for longer parts of the year and thereby cutting transportation time. The turn to low-carbon energy creates new business opportunities for companies involved in innovation, development, construction, and/or siting of low-carbon energy production facilities, such as wind, solar and hydro-power, batteries for energy storage, and the multiple suppliers of minerals, other materials and man-power required to build, run, and maintain the facilities.

Under the Paris Agreement, governments commit to holding the increase in the global average temperature to well below 2 °C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5 °C. The IPCC (2018) has observed that keeping average global warming at 1.5 °C requires a reduction of greenhouse gas emissions to 45% below their 2010 levels by 2030 and reaching “net zero” emissions by 2050. Net zero means that all remaining greenhouse gas emissions must be offset through

reforestation, carbon capture, and storage or other such means.

Governments are adopting policy response to deliver on their commitments under the Paris Agreement and Agenda 2030. Several of these public policy initiatives have implications for companies.

Businesses may engage in climate change mitigation (processes for reducing greenhouse gas emissions) on their own account, or as responses to public policies or to stakeholder expectations or pressure. Mitigation typically requires novel techniques or equipment and/or change of practices. This can function as an investment for a company by contributing to the urgent lowering of greenhouse gases, preparing the company for potential stricter governmental requirements, and/or responding to or preempting stakeholder expectations.

Companies may contribute through the design and construction of climate change adaptation initiatives, for example, dykes or dams to prevent flooding, protecting and ensuring access to drinking water, or buildings that are able to resist higher water levels. From a corporate sustainability perspective, companies may approach collaboration in such activities as an investment. If driven by a moral commitment to help host governments and local communities meet climate change effects rather than with a view to the company's own economic interest, the activity could be CSR informed by sustainability.

Companies may also consider joining local initiatives for fossil-free energy. Such a step based in corporate sustainability can help them cut their fossil-based energy usage, but also help build energy resilience for the local community and help the community reduce their own fossil-fuel energy consumption.

From a corporate sustainability perspective, companies can lower their carbon energy usage and adapt other practices to decrease energy use. Renewable energy production causes less greenhouse gas emission than fossil fuel usage, but the production, transport, and setting-up of the equipment (such as wind mills or solar power panels) require energy. So far, much of this energy is at least partly dependent on fossil fuel. Until all

energy production is at least greenhouse gas neutral in terms of equipment and production, cutting energy requirements through the supply chain can be considered corporate sustainability.

When considering its actions based on a strategy of corporate sustainability, a company may also consider the vulnerability of the communities in which it operates or is involved through its business relations. Studies show that groups or individuals who are already vulnerable are also susceptible to higher negative impacts from climate change (IHRB 2020). For example, this can apply to those who belong to minorities. As the discussion below on just transitions shows, even in the Arctic parts of the Nordic countries that enjoy mature democracies, strong institutions, and the rule of law, Indigenous Sámi people may be at particular risk of harmful effects on their livelihoods and traditions as a result of a turn to low-carbon energy production and mining of minerals for energy storage.

### Just Transitions and the Role of Business
